#### CHAP. IV.—WHY THE LAMP BURNS.

A strong, friendly arm supporting him, and a soft hand holding his own, partly recalled Caleb to himself. But the young voice and the firm footstep still haunted his ear. He surely had been dreaming—dreaming of fifty years ago. How could Ringwood's voice—the voice of his old enemy—sound so young and cheerful now? He should be eighty—at least eighty—if still living. But the old lamplighter had for a long time past believed that his fellow-clerk was dead. He had listened for so long—so very long—that a sense of mysterious terror had seized upon him. It was like a voice from the dead: the very thought was a hideous unreality: it appalled him. Was it possible that they could ever meet on this side of the grave?

'Why, grandfather'—it was Pearl's voice now—'what has happened? Your hand is trembling, dear. Did you fall?'

'Ay, ay,' Caleb answered, stretching out his arm gropingly. 'I'm a bit overset, I think. This is the old gateway, ain't it?'

'Why, Mr Cobb,' said Jarvis, 'don't you

remember? I promised to come back with Pearl; and here we are.'

'Yes, yes,' said the old man, as Jarvis helped him to regain his feet.—'I remember. It's the churchyard where she lies.—Dear me, dear me! Can it be fifty years ago? It seemed, while I sat here, only yesterday. I thought— Did you hear any one singing, Pearl, as you came along?'

'No, grandfather.—Shall we go home?' asked the girl anxiously. 'You are tired. You should not have come out alone, dear, on a night like this.'

'Not to be near her resting-place?—Ah, well! Perhaps you're right.—Come, Pearl,' said Caleb; 'come, John. Let us go home. I'll visit the old gateway no more until I'm laid beside her.'

He walked very feebly, and leaned heavily upon Jarvis as they made their way towards Old Stairs. But then the wind was as rough as ever, and grew rougher still as they approached the river-bank: it was scarcely surprising that the blind old lamplighter was sometimes stumbling in his pace. Pearl, struggling along bravely at his side, spoke laughingly to cheer him.

'Look, John!' said she, as they approached the jetty and came in sight of Caleb's home.—'look how brightly our lamp is burning! No wonder Number One is called the "Little Lighthouse." There's no one can trim a lamp like grandfather.'

The fire was burning brightly, too, as they entered and shut out the wind. Caleb, still leaning upon John's arm, slowly crossed the room and sank down wearily in his armchair beside the hearth. He was still strangely agitated; and the trembling of his hand to-night was due, as Pearl observed, to something more than old age. She noticed, as she leaned over him caressingly, and took from him his hat and stick, that he was paler and more wrinkled than she remembered to have seen him during all those days that she had watched his anxious face.

She exchanged a quick, inquiring glance with Jarvis, and then began to lay the table for supper with a light step, accompanied by snatches of songs. She feared that her grandfather would read her thoughts, and she feigned merriment, in order to conceal her increasing distress; for Pearl dreaded that at any moment Mark Ringwood might return.

'Are you going?' said she, with surprise, as Jarvis put out his hand.—'Won't you stop and take a bit of something with us? The supper is almost ready.'

'No, thank you, Pearl—not to-night. Another evening.—Good-bye, Mr Cobb.'

'Good-bye, John,' said Caleb, holding out both his hands. 'You're a kind lad. I don't know what we should do without you. Eh, Pearl? I don't know what we should do without a friend like John.'

'No, indeed,' answered Pearl with a grateful expression in her eyes. 'He is the best of friends.' Then she added: 'You will come to-morrow, won't you?'

Jarvis promised; and with a lingering look at the girl's face, as though he would read her thoughts, went out into the night.

Pearl knew that Jarvis loved her, though he had never spoken. She loved him too, as a sister

loves, with true devotion. His many acts of kindness to her—his untiring attention to her grandfather—had awakened a painful sense of regret that she could never feel as he would wish towards him. He had seemed to her in her childhood to take a brother's place in her heart. He was her brother still. Was it in the nature of things that she should change?

It was with such thoughts as these—thoughts which daily recurred to her busy brain—that Pearl moved about the little room, and still sang snatches of songs while engaged in her household duties. And she frequently cast a loving glance towards her grandfather, as if he must know, though he could not see her bright, dimpling face, that he was not forgotten.

Caleb was unusually silent to-night; and Pearl began to notice an expression on his face which she had observed before, though never without concern. He appeared to her to be listening, and listening with a most intense expression of purpose and suspense. What could have happened? The wind whistled and groaned and fled up the river with a shuddering sound. Could he be listening to that? In his present humour she dreaded to speak to him of Mark Ringwood; and yet she knew that if she delayed, Ringwood would return and it would be too late.

'Come, grandfather,' said the girl, placing her hand in his, 'the supper is ready now. You must be hungry, after such a breezy walk. Are you not?'

He allowed her to lead him to the table, docile as a child. But when he was seated in his place, he leaned back, as though he had forgotten, if indeed he had comprehended, the reason for leaving his armchair.

Pearl had often seen him bowed down by fits of depression, and often absent-minded for hours together, but never so strange as he appeared now. 'Dear grandfather,' said she coaxingly, 'you are eating nothing; and I've cooked such a nice little supper—sausages and mashed potatoes. It's your favourite dish, you know.'

At the sound of her voice, he sat up and turned his poor blind look smilingly towards her. The expression brought tears to the young girl's eyes. He ate without appetite, as though forcing himself to exhibit some heartiness simply to please her. Returning presently to his armchair, when he no longer heard Pearl's knife and fork, he said in a thoughtful tone: 'Pearl, my dear?'

'Yes, grandfather.'

'The lamp in the window is burning—burning brightly still, is it not?'

'It is indeed.'

After pondering a moment, and tugging nervously at a coat button, Caleb resumed: 'When I'm gone—when I'm dead, and buried beside her in the old churchyard, that lamp will go out. It won't be worth any one's while, I should reckon, to keep it trimmed.—I never told you,' he added, 'what first put the idea of trimming that lamp into my head; did I?'

'Wasn't it, grandfather, to light the boatmen on rough dark nights like this?'

'Partly, my dear. But there was another reason. I had a strange fancy, when my eyesight went, and I had to give up the street lamps—I had a strange fancy that some one—some one who once did me a great wrong—might be

attracted, just as a moth is attracted by a flame, towards this house. I wanted to get him—as I have wanted for fifty years past—wanted badly to get him into my clutches. While I had the use of my eyes—and I made the street lamps as bright as possible, so that they might aid me after dark—I could look out for the man at every turning; and I did.—It was a strange fancy, wasn't it?"

"Yes—very strange." And Pearl, with the young sailor and the sealed packet ever present in her thoughts, added, after a moment's reflection: "Is it so long as fifty years ago?"

"Yes; rather more than fifty. It's fifty years to-night, my dear, since my old sweetheart, Helen Haythorpe, died of a broken heart."

Pearl kneeled down beside Caleb and took his hand between her own. "Poor grandfather! How you must have loved her."

"I loved her," said Caleb, in a faltering voice—"I loved her as much as I hated him—as I hate him still!"

"But, grandfather—after all these years—he must be dead."

"Ah! why do you say that?" cried Caleb. "Pearl, my dear, I have a sort of presentiment—it's always stronger upon me when this day comes round—that if my old enemy, Ringwood, was dead, I should hear of it to-night."

The girl involuntarily pressed the old man's hand and looked nervously towards the door. "Ringwood?"

"Yes.—Listen to me, Pearl," said Caleb with strange energy in his tone. "On the night she died, I cursed him. I curse him now and all that belongs to him, and I call upon heaven!"

"Grandfather! Will you let me speak?" She had placed an agitated hand upon his lips.

He caught the hand in his fingers with a tight grip. "What do you mean?" said the old man. "Hide nothing from me!"

Still kneeling beside him, with the light of the fire upon her uplifted face, the girl answered in a trembling voice: "This evening, grandfather, while you were waiting at the old gateway, a small boat came alongside the jetty. Your lamp, burning in the window, had acted as a beacon. The boat would otherwise have been capsized among the barges. I had just returned home, and hearing a cry, ran out with the lantern. There was a sailor in the boat. He asked me, as soon as he had landed, to direct him to Number One Old Stairs. He said that he had been told that Caleb Cobb lived there, and added that he wished particularly to see him."

"He asked for me?" said Caleb in a breathless voice.

"I told him that you were not at home, but that you would return in an hour or so."

"What was he like?" Caleb eagerly inquired. "Was he young or old?"

"A young sailor. A sailor," continued Pearl in a faltering tone, "with fair curling hair and handsome eyes. He had a very honest face, grandfather—he had indeed."

"Ah! His name, Pearl—what was that?"

"His name?" repeated the girl, with feigned indifference. "Oh, I'm coming to that.—He followed me to our door; and as I was on the point of stepping in—with my finger on the latch—he touched his breast-pocket and said:

"Will you take charge of a packet for me? It's valuable. If I intrust it to you, it will be so much off my mind."

"You refused?"

"Dear grandfather, how could I refuse? He followed me into this room, and took out the packet—and a good-sized one it is too—and gave it to me. It's like a large letter, sealed with four black seals, and it's addressed "Caleb Cobb, London."—Shall I—shall I open it?"

Caleb made no answer. His thoughts were wandering—as it soon became clear to Pearl—wandering into the past; for when she added, "The packet contains, I believe, a message from the dead," still the old lamplighter was silent.

At last he spoke. "It was he who robbed the house of Rudstone and Company. The sum was one thousand pounds.—Shall I never meet the man—never have justice?" and Caleb covered his face with his hands. "I told her all—everything, and she never doubted me. That was my consolation: it has been my only one for all these years." He paused a moment, with his head still bent. "But it broke her heart—it broke her poor young heart. How could I marry her? How could I face her honest friends? They were proud, and wealthy too. Poor Helen! She would have shared a garret with me. But I was an outcast; I was branded as a thief! It killed her; and her death is at his door.—Have I not had good cause to hate him?" Once more he was silent for a while, but never raised his face. "At first—for I was strong enough—I worked at the docks—I worked there like a horse. If I hadn't tired myself out with bodily exertion, I should have assuredly gone raving mad. One day, as I was lifting a bale of goods upon a truck, I overheard the superintendent relating to an old sea-captain how a man named Ringwood—head cashier in the house of Rudstone, Marling, & Company—had been taken into the firm as a junior partner. It stunned me as much as though I had been struck down."

The pause was longer this time; and Pearl, stealing quietly to the old bureau, brought out the sealed packet, and had regained her place at his side before he resumed.

"I was queer in the head for months after that; and when I left the hospital, I was still weak and ill. I never got all my strength back again. It was then that I took to lamp-lighting; and although it came to my ears that Ringwood had gone abroad, and was representing the great house in the East Indies, I never lost all hope that the day would come when we should meet again face to face. I never lost all hope that the day would come!"

Suddenly, Caleb stopped. A loud knocking shook the street door; and a voice, which sounded distinctly above the noisy storm, called out: "Is Caleb Cobb at home?"

The girl had risen to her feet; and Caleb, with his face eagerly upturned, had also risen, and with a threatening gesture was stepping forward, when Pearl stopped him. "Grandfather, it's the messenger," she whispered soothingly in his ear—"the messenger who left this packet."

"What messenger? I tell you it's his voice.—Let me pass! I'm old, I know, and blind; but!"

The visitor, as though blown in by a gust of

wind, stood before them. Shutting the door quickly, he folded his arms, and leaning his back against the panelling, looked down with compassion at the old lamplighter.

### CAN IMAGINATION KILL?

MEDICAL doctors and persons experienced in human ailments are acquainted with the important part which imagination plays in respect to the origin and cure of diseases. Medical aid is sometimes sought by persons who *really* believe themselves suffering from some bodily affliction, but who, when examined, are found to be quite free from every possible ailment. It is also well known that sick persons recover quickly or slowly according as they have or have not faith in their medical adviser or in his nostrums. This introduces the much wider subject of faith-healing, on which a great deal has recently been said, and by means of which much benefit appears to have been derived.

Cases in which illnesses are originated or aggravated by the imagination are numerous; but those which have terminated fatally are comparatively rare. At first, it is difficult to lead one's self to believe that imagination can really kill; but a brief consideration of the slight effects produced in less serious cases prepares the way for further belief. One or two instances of non-fatal cases will suffice.

Some time ago, a girl about sixteen years of age had a prescription made up at a chemist's. The prescription was a double one—part being for internal use, and part for external application only. The usual red 'Poison' label was affixed to the bottle containing the lotion, and a verbal caution was also given. The girl, having been under medical treatment for some time previous, was permitted to take and apply the medicines herself; and so careful was she, that her precautions to avoid mistakes were the subject of frequent comment and occasional banter. One day, a male cousin, having unfortunately resolved to play her a practical joke, transposed the labels on the bottles—which in other respects were not very much unlike—soon after the girl had taken her first dose. In an apparently careless way, her attention was directed to the bottles, and, to her horror, she discovered that she must have drunk some of the lotion. Within half an hour she had frightened herself into the belief that she was poisoned. She complained of a burning sensation in the throat and stomach, of colic, and other symptoms of poisoning. A little later, she was seized with an overpowering tendency to sleep. The doctor was summoned in haste. He heard the girl's story, and applied such remedies as he thought proper. But the girl grew worse. She was sinking so rapidly, that at last the frightened and hitherto silent culprit confessed what he had done. At first, the girl did not believe him; and it was not until the doctor had taken a large dose from the red labelled

bottle that she was convinced. Then she began to recover, and in a few hours the immediate effects of the practical joke had left her.

A well-authenticated case is told of a young lady who for seven years or more has been under the impression that she is paralysed. She looks strong and healthy, but lies all day on a couch, and has to be carried about in an invalid chair. She shrieks with pain whenever a limb is moved. Her parents have taken her to at least a dozen physicians—some of the most eminent men in London—and all agree that she is in perfect health. One of them plainly told her, after a most exhaustive examination, that she was simply wasting her parents' money, and added, that he would gladly give a hundred pounds in exchange for such a constitution as hers.

And now as to the fatal cases. Some time last summer, an inquest was held in London on the body of a young woman who, it was supposed, had poisoned herself. The usual examination of the contents of the stomach was made by the government analyst, Dr Tidy; but no traces of poison could be detected. The examination showed, however, that the stomach contained a powder which in appearance and general character corresponded with a certain insect powder. Now, the manufacturer claims that this powder is absolutely non-poisonous, and chemists do not regard as a poison the vegetable from which this powder is prepared. Dr Tidy at the time tried its effects upon a rabbit and a dog, and although experiments on so limited a scale are by no means conclusive, still neither animal was affected by it. In the absence of evidence of other causes to account for death, the only assumption that could therefore be made was, that the woman had taken the insect powder, believing it to be poisonous, and through her own imagination caused her death.

Some years ago, Napoleon III., while Emperor of France, permitted a French physician to experiment on a convict who was sentenced to death. The condemned man was delivered to the physician, who had him strapped to a table and blindfolded, ostensibly for the purpose of being bled to death. Near the drooping head was placed a vessel of water, which, by means of a siphon arrangement, trickled audibly into a basin below, at the same moment that a superficial scratch with a needle was made right across the culprit's neck. Perfect silence was maintained, and in six minutes the man was dead.

General Johnston, leader of the Confederate armies, tells of a case that came under his own observation. He, when a lieutenant, learned that some acquaintances had concocted a plan for testing the power of imagination on the human system. The plan was that half a dozen of them should, apparently by accident, meet some particular individual and comment on his appearance of extreme illness. A healthy young man was selected for experiment; and the result of this joke was that he sickened and died.

Another case is said to have occurred in a university town in Scotland. A college porter having made himself particularly obnoxious to the students, they resolved to be revenged upon him. For this purpose, they decoyed him into a room one night, held a mock inquiry into his bad

behaviour, and, with a great outward show of solemnity, sentenced him to be decapitated—the execution to take place at once. The terrified porter was led to a quiet corner where stood a huge block and a keen axe; he was then blindfolded, and compelled to kneel and lay his head on the block. The executioner struck him on the neck with a wet towel, and the porter was lifted up—dead.

## STORIES OF SEVEN BOYS.

BY ONE OF THEM.

It is sometimes said of families, as of nations, that the happiest are those that have no history. But every family, and especially every large family, has one history at anyrate that is very dear and very real to all its members, for the heroes of this history are the members of the family, its scene is the nursery floor, and its rulers and lawgivers are 'father' and 'mother.' Happy, indeed, is the family where this history is a full one, and unhappy is the family that has no such history. Looking back on our own nursery days, I cannot say that we were precocious children—I do not think we were even clever children—but judging from the stories that are told of us and at us, we must have been to some extent amusing children. Whether there would have been more or fewer stories to tell, if, instead of being seven boys, we had been seven girls, or even seven boys and girls, is an open question. Seven boys we were, and as such, the stories that form our history are told of us.

We were always town boys. Who but a town boy could have been the hero of such a tale as this? One of us, then only three or four years old, was on a visit to the country. To him, many of the commonest objects of country life were novel, so much so, that even a horse quietly grazing in a roadside field was accounted worthy of special attention, and was accordingly pointed out to the young townsman. 'See, Arthur; there's a horse.' The reply was as prompt as it was unexpected: '*That's not a horse; it's a cow!*'—'No, no; that one over there;' and the horse was pointed out again. Remonstrance, however, was vain, for the youngster still held to his theory. '*It isn't a horse,*' he declared with an air of conviction based on experience—'*it isn't a horse. It's a cow! Horses has cabs to 'em!*' And no amount of argument could induce the young townsman to entertain the bare idea of a horse without a cab.

At one time we had a little sister. Her immediate predecessor had among his toys an india-rubber doll that squeaked on being hammered in the stomach. One day the nurse left the baby-girl quietly sleeping in her cradle, with her youngest brother playing contentedly in the room. Before long, the nurse was brought back by loud cries from the baby; and on hurrying to find a reason for this disturbance, soon discovered it.

Not understanding that there was any material difference between the doll and his baby-sister, it had occurred to the young gentleman, who had *probably* heard the baby cry, that the cries were produced in the same manner in both instances. Fired with a mistaken ambition to make the 'new dolly' cry for himself, he had promptly seized the opportunity afforded by the nurse's absence, and was vigorously pounding his sister's stomach, accompanying each thrust by the command, 'Queak, dolly! 'queak!' and delightfully increasing the power of his *tattoo* as the unfortunate baby's cries grew louder.

Another brother, staying at the time with his grandmother, was very restless one afternoon, and not content with admiring the view from the window himself, must needs draw his grandmother's attention again and again to passing objects. At last he espied a policeman, and asked: 'What's he looking for, gam'ma?' Here was an opening for well-merited reproof, and the reply was no doubt intended to crush the juvenile questioner: 'Oh, I should think he's looking for naughty little boys!' But the watch at the window was resumed, and before long another policeman came in sight, to be greeted by a delighted exclamation, that called forth from the grandmother the pointed inquiry: 'Well, what's he looking for?' This time it was the youngster's turn, and it was with an air of steady conviction that he announced: 'I should think he's looking for naughty gam'mas!'

The same young gentleman early displayed a marked partiality for the fair sex, and returning one evening from a children's party, was heard to complain, in a very injured tone: '*I wis' little girls' mamas wouldn't put so many pins in 'em. I just put my arm round one of der necks, and I pricked myself ever so!*'

A youngster under four years old was going from home for a while. His governess was to be left behind; and feigning deep sorrow at his abandonment of her, she asked what she was to do while he was away. 'Oh, sit on a mossy 'tone and weep,' was the quick and apt reply, worthy of a proverbial philosopher himself.

The confusing tendency of the multiplicity of drawers affected by chemists as a background to their counters, and of their habit of using the drawers for other articles than the drugs whose formidable and high-sounding names they bear, is well shown in the following anecdote. One of us was sent to the chemist's on some little errand. Thirsting for knowledge, the youth carefully followed every movement of the man of bottles, and returned to pose his father with a curious question: '*Papa, what is Jalap Rad.?*' As he could, the father explained the uses of the potent root, to the bewilderment of his son, whose rapidly formed conclusion was being as rapidly undermined. At last his disappointment found words: '*Hm! I thought it meant corks! I saw him take corks out of that drawer, anyway.*' He fancied he had discovered the medical name for corks!

Not only were we town boys; we were inland boys also, and the common objects of the countryside were not less familiar to us than those of

the beach. Shrimps were to us unknown—not so crickets. One of us craning himself up to the level of the table edge, which he could then hardly reach, caught sight of some shrimps on the tea-table one day. Now, on the nursery tea-table there had been no shrimps, and this division of the spoils struck young hopeful as not quite fair, so he asked at once: 'Aren't I to have no crickets to my tea?'

Editors of books of quotations likely to fall into the hands of children, please note the next incident, which occurred to the youth who was the hero of the 'Jalap Rad.' mistake. He picked up a book of quotations, and again and again he came across the word 'Ibid.' at the close of quotations. At last he jumped at its meaning, and recognising in conversation a passage so terminated in the book, avowed that he knew who wrote that—'It was Ibid!' One of his brothers made a very similar mistake when he inquired, 'Who was "Old Ballad" who wrote *Babes in the Wood*?'

Such are some of the stories that are told of us. We are still seven, but whether we should all approve of being dubbed 'boys' is a matter of grave doubt. Each year the new stories grow fewer, but the old ones become more and more interesting as their heroes grow in years.

#### DISCOVERY OF FRESCOS IN DUBLIN.

Those who have wandered much through the principal Italian towns with the laudable desire of seeing all that is to be seen, must, like Nathaniel Hawthorne, have often felt rather overdone with frescoes, especially the modern highly coloured specimens which floridly greet the eye of the spectator on entering the churches, and gaudily hold their own in rivalry with the altarpieces in oils or mosaics. But to the archaeologist, frescoes must ever be interesting, being the most ancient mode of painting at present in use, the fresh durable colours requiring no particular standpoint from which to be viewed, and looking as clear to-day as when fresh from the painter's brush hundreds of years ago. The subjects are mainly scriptural, as being suitable to churches; the inimitable quaintness of those adorning the walls of the crypt of St Peter's, Rome, and the mixture of weirdness and grotesqueness of those in the Campo Santo at Pisa, most forcibly appeal to all those for whom originality and quaintness of conception possess a charm.

The recent discoveries of interesting antiquities in the ancient church of St Audoen's, Dublin, has been a great find for archaeologists, comprising as they do frescoes of the thirteenth century, remarkable monuments dedicated to a family named Malone, as well as other monuments of extreme antiquity. On the wall over the Malone monument are a number of stucco figures representing a priest in the act of celebrating mass, while around are a number of acolytes assisting. Other noteworthy finds are three of those architectural curiosities called 'squints' or hagioscopes. These latter are neither more nor less than peepholes used for observing divine service by those who did not wish to mix with the congregation, or to be seen by them.

It is not surprising that the capital city of the 'Isle of Saints' should be rich in objects of

antiquarian interest, which are stored chiefly in her churches. The recent unearthing of the old chapter-house of Christ's Church Cathedral, and the perhaps still more interesting archaeological discoveries at St Mary's Abbey, prove to what an extent the excavations of the Board of Works have been and may yet be rewarded by researches in the ancient quarters of that city.

Two churches almost adjoining—one belonging to the Protestant, the other to the Roman Catholic Church—are, curiously enough, dedicated to the same saint, St Audoen. It is in the Protestant church that the interesting discoveries are being made; these centre chiefly in St Anne's Chapel (leading from the main entrance), in an altar recess of which are the frescoes. They are in the early Italian style and are in a fair state of preservation. They represent the Trinity; and, after a careful study, there is discernible the head of the Father, beneath which is the Dove descending from His lips in the direction of the Redeemer on the cross; and around are angels in attitudes of adoration. The colouring is chaste and simple—a deep cream ground, on which the figures are outlined in red; and the whole forms a fair-sized altarpiece. The upper part is well defined, and the colouring distinct, especially the head of the Father; but the lower part is a good deal defaced, notwithstanding the greatest precautions being used during the excavation. These are the only frescoes that have as yet been discovered in Ireland. The ruins of this interesting old church will repay a visit. The discovery of a narrow winding passage, leading from the church to the adjacent street, through solid blocks of masonry, adds still further to the interest of the excavations.

#### ABSIT OMEN.

THERE never was anything like to-day!  
You and your eyes, and the breath of May:  
A hint of Summer, to make us glad;  
A tinge of Winter, to keep us sad;  
Brown boughs clothed in a mist of green—  
Green, with the pink of the buds between.  
But the naked hollows here and there,  
The light wind wandering everywhere,  
Fills with the grace of the tossing leaves.  
It is Spring at last, for who sees believes;  
And I have not a grief that I know of—none.  
—There's only a cloud come over the sun!

What have you done to embitter the day?  
One little word, and the blue turned gray.  
The rain-clouds gather, and more behind;  
The wind that was gentle has grown unkind.  
As you sit there silent, it seems like years  
Since last you spoke, yet my heart still hears.  
Nay, never look up! No blue in the sky!  
The sad spring blossoms go drifting by;  
They had only just had the time to blow,  
When you changed your mind, and they had to go.  
Winter's not over, nor Spring begun;  
What have you done, Sweet, what have you done?

## THE MAKERS OF SUMMER.

BY RICHARD JEFFERIES.

THE leaves are starting here and there from green buds on the hedge; but within doors, a warm fire is still necessary, when one day there is a slight sound in the room, so peculiar, and yet so long forgotten, that though we know what it is, we have to look at the object before we can name it. It is a house-fly, woke up from his winter sleep, on his way across to the window-pane, where he will buzz feebly for a little while in the sunshine, flourishing best like a hothouse plant under glass. By-and-by he takes a turn or two under the centre-piece, and finally settles on the ceiling. Then, one or two other little flies of a different species may be seen on the sash; and in a little while the spiders begin to work, and their round silky cocoons are discovered in warm corners of the woodwork. Spiders run about the floors and spin threads by the landing-windows; where there are webs, it is certain the prey is about, though not perhaps noticed. Next, some one finds a moth. Poor moth! he has to suffer for being found out.

As it grows dusk, the bats flitter to and fro by the house; there are moths then abroad for them. Upon the cucumber frame in the sunshine, perhaps there may be seen an ant or two, almost the first out of the nest; the frame is warm. There are flowers open, despite the cold wind and sunless sky; and as these are fertilised by insects, it follows that there must be more winged creatures about than we are conscious of. How strange it seems, on a bleak spring day, to see the beautiful pink blossom of the apricot or peach covering the gray wall with colour! snow-flakes in the air at the time. Bright petals are so associated with bright sunshine, that this seems backward and inexplicable, till it is remembered that the flower probably opens at the time nearest to that which in its own country brings forth the insects that frequent it. Now and again, humble-bees go by with a burr; and it is curious

to see the largest of them all, the big bombus, hanging to the little green gooseberry blossom. Hive-bees, too, are abroad with every stray gleam of sun; and perhaps now and then a drone-fly—last seen on the blossoms of the ivy in November. A yellow butterfly, a white one, afterwards a tortoise-shell—then a sudden pause, and no more butterflies for some time. The rain comes down, and the gay world is blotted out. The wind shifts to the south, and in a few days the first swallows are seen and welcomed, but, as the old proverb says, they do not make a summer. Nor do the long-drawn notes of the nightingale, nor even the jolly cuckoo, nor the tree-pipit, no, nor even the soft coo of the turtle-dove, and the smell of the May-flower. It is too silent even now; there are the leading notes; but the undertone—the vibration of the organ—is but just beginning. It is the hum of insects and their ceaseless flitting that make the summer more than the birds or the sunshine. The coming of summer is commonly marked in the dates we note by the cuckoo and the swallow and the oak-leaves; but till the butterfly and the bee—one with its colour, and one with its hum—fill out the fields, the picture is but an outline sketch. The insects are the details that make the groundwork of a summer day. Till the humble-bees are working at the clover, it is too silent; so I think we may begin our almanac with the house-fly and the moth and the spider and the ant on the cucumber frame, and so on, till, finally, the catalogue culminates with the great yellow wasp. He is the final sign of summer; one swallow does not make it; one wasp does. He is a connoisseur of the good things of the earth, and comes not till their season.

On the top of an old wall covered with broad masses of lichen, the patches of which grew out at their edges as if a plate had taken to spreading at its rim, the tits were much occupied in picking out minute insects; the wagtails came too, sparrows, robins, hedge-sparrows, and occasionally a lark; a bare blank wall, to all appearance, and the bare lichen as devoid of life to our eyes.

Yet, there must have been something there for all these eager bills—eggs or pupæ. A jackdaw, with iron-gray patch on the back of his broad poll, dropped in my garden one morning, to the great alarm of the small birds, and made off with some large dark object in his beak—some beetle or shell, probably—I could not distinguish which, and should most likely have passed the spot without seeing it. The sea-kale, which had been covered up carefully with seaweed, to blanch and to protect it from the frost, was attacked in the cold dry weather in a most furious manner by blackbirds, thrushes, and starlings. They tore away the seaweed with their strong bills, pitching it right and left behind them in as workman-like style as any miner, and so boring deep notches into the edge of the bed. When a blackbird had made a good hole, he came back to visit it at various times of the day, and kept a strict watch. If he found any other blackbird or thrush infringing on his diggings, he drove him away ferociously. Never were such works carried on as at the edge of that seaweed; they moved a bushel of it. To the eye, there seemed nothing in it but here and there a small white worm; but they found plenty, and the weather being so bitter, I let them do much as they liked; I would rather feed than starve them.

Down at the seashore in the sunny hours, out from the woodwork of the groynes or bulwarks, there came a white spotted spider, which must in some way have known the height to which the tide came at that season, because he was far below high-water mark. The moles in an upland field had made in the summer a perfect network of runs. Out of curiosity, we opened some, and found in them large brown pupæ. In the summer-house, under the wooden eaves, if you look, you will find the chrysalis of a butterfly, curiously slung aslant, and waiting for the time to 'burst as a seraph on the blaze of day.' Coming down Galley Hill, near Hastings, one day, a party was almost stopped by finding they could only walk on thousands of caterpillars, dark with bright yellow bands, which had sprung out of the grass. The great nettles—now, nothing is so common as a nettle—are sometimes festooned with a dark caterpillar, hundreds upon each plant, hanging like bunches of currants. Could you find a spot the size of your watch-seal without an insect or the germ of one?

The agriculturists in some southern counties give the boys in spring threepence a dozen for the heads of young birds killed in the nest. The heads are torn off, to be produced, like the wolves' of old times, as evidence of extinction. This—apart from the cruelty of the practice—is, I think, a mistake, for, besides the insects that injure crops, there are some which may be suspected of being inimical to human life, if not directly, indirectly; and if it were not for birds, we should run a very good chance of being literally eaten up. The difficulty is that people cannot believe what they cannot immediately see, and there are very few who have the patience or who feel sufficient interest to study minute things.

I have taken these instances haphazard; they are large instances, as it were, of big and visible

things. They only give the rudest idea of the immensity and complexity of insect life in our own country. My friend the sparrow is, I believe, a friend likewise to man generally. He does a little damage, I admit; but if he were to resort to living on damage solely in his enormous numbers, we should not have a single flower or a single ear of wheat. He does not live by doing mischief alone evidently. He is the best scavenger the Londoners have got, and I counsel them to prize their sparrows, unless they would be overrun with uncomfortable creatures; and possibly he plays his part indirectly in keeping down disease. They say in some places he attacks the crocus. He does not attack mine, so I suspect there must be something wrong with the destroyed crocuses. Some tried to entice him from the flower with crumbs; they would perhaps have succeeded better if they had bought a pint of wheat at the seedsman's and scattered it. In spring, sparrows are not over-fond of crumbs; they are inordinately fond of wheat. During the months of continued dry, cold, easterly winds, which we have had to endure this season, all insect-eating birds have been almost as much starved as they are in winter when there is a deep snow. Nothing comes forth from the ground, nothing from the deep crannies which they cannot peck open; the larva remains quiescent in the solid timber. Not a speck can they find. The sparrow at such a time may therefore be driven to opening flower-buds. Looked at in a broad way, I am convinced he is a friend. I have always let them build about the house, and shall not drive them away.

If you do not know anything of insects, the fields are somewhat barren to you. The buttercups are beautiful, still they are buttercups every day. The thrush's song is lovely, still one cannot always listen to the thrush. The fields are but large open spaces after a time to many, unless they know a little of insects, when at once they become populous, and there is a link found between the birds and the flowers. It is like opening another book of endless pages and coloured illustrations on every page.

Blessings on the man, said Sancho Panza, who first invented sleep. Blessings on the man who first invented the scarlet geranium, and thereby brought the humming-bird moth to the window-sill; for, though seen ever so often, I can always watch it again hovering over the petals, and taking the honey, and away again into the bright sunlight. Sometimes, when walking along, and thinking of everything else but it, the beautiful peacock butterfly suddenly floats by the face like a visitor from another world, so highly coloured, and so original, and unlike and unexpected. In bright painters' work like the wings of butterflies, which often have distinct hues side by side, I think nature puts very little green; the bouquet is not backed with maiden-hair fern, the red and the blue and so on have no grass or leaves as a ground-colour; nor do they commonly alight on green. The bright colours are left to themselves unrelieved. None of the butterflies, I think, have green on the upper side of the wing; the Green Hairstreak has green under-wings, but green is not put forward.

Something the same may be noticed in flowers themselves; the broad surface, for instance, of the

peach and apricot, pink without a green leaf; the pear-tree white, but the leaves come quickly; the apple, an acre of pink and white, with the merest texture of foliage. Nor are there many conspicuous green insects—the grasshopper; some green flies; the lace-fly, a green body and delicate white wings. With the wild-flowers, on the contrary, there seems to come a great deal of green. There is scarcely a colour that cannot be matched in the gay world of wings. Red, blue, and yellow, and brown and purple—shaded and toned, relieved with dots and curious markings; in the butterflies, night tints in the pattern of the underwings, as if these were shaded with the dusk of the evening, being in shadow under the vane. Gold and orange, red, bright scarlet, and ruby and bronze in the flies. Dark velvet, brown velvet, grays, amber, and gold edgings like military coats in the wild-bees. If fifteen or twenty delicate plates of the thinnest possible material, each tinted differently, were placed one over the other, and all translucent, perhaps they might produce something of that singular shadow-painting seen on the wings of moths. They are the shadows of the colours, and yet they are equally distinct. The thin edges of the flies' wings catch the sunbeams, and throw them aside. Look, too, at the bees' limbs, which are sometimes yellow, and sometimes orange-red with pollen. The eyes, too, of many insects are coloured. They know your shadow from that of a cloud. If a cloud comes over, the instant the edge of the shadow reaches the grass-moths, they stop, so do some of the butterflies and other insects, as the wild-bees, remain quiescent. As the edge of your shadow falls on them, they rise and fly, so that to observe them closely it must not be allowed to overlap them.

Sometimes, I think insects smell the approaching observer as the deer wind the stalker. The gatekeeper-butterfly is common; its marking is very ingenious, may I say? regular, and yet irregular. The pattern is complete, and yet it is incomplete; it is finished, and yet it suggests to the mind that the lines ought to go on farther. They go out into space beyond the wing. If a carpet were copied from it, and laid down in a room, the design would want to run through the walls. Imagine the flower-bird's wing detached from some immense unseen carpet and set floating—it is a piece of something not ended in itself, and yet floating about complete. Some of their wings are neatly cut to an edge and bordered; of some, the edge is lost in colour, because no line is drawn along it. Some seem to have ragged edges naturally, and look as if they had been battered. Towards the end of their lives, little bits of the wing drop out, as if punched. The markings on the under-wings have a tendency to run into arches, one arch above the other. The tendency to curve may be traced everywhere in things as wide apart as a flower-bird's wing, and the lines on a scallop shell.

I own to a boyish pleasure in seeing the clouds of brown chafers in early summer clustering on the maple hedges and keeping up a continual burring. They stick to the fingers like the bud of a horse-chestnut. Now the fern-owl pitches himself over the oaks in the evening as a boy might throw a ball careless whither it goes; the next moment he comes up out of the earth under

your feet. The night-cuckoo might make another of his many names; his colour, ways, and food are all cuckoo-like; so, too, his immense gape—a cave in which endless moths end their lives; the eggs are laid on the ground, for there is no night-feeding bird into whose nest they could be put, else, perhaps, they would be. There is no night-feeding bird to feed the fern-owl's young. Does any one think the cuckoo could herself feed two young cuckoos? How many birds would it take to feed three young cuckoos? Supposing there were five young cuckoos in the nest, would it not take almost all the birds in a hedge to feed them? For the incredible voracity of the young cuckoo—swallow, swallow, swallow, and gape, gape, gape—cannot be computed. The two robins or the pair of hedge-sparrows in whose nest the young cuckoo is bred, work the day through, and cannot satisfy him; and the mother-cuckoo is said to come and assist in feeding him at times. How, then, could the cuckoo feed two or three of its offspring and itself at the same time? Several other birds do not build nests—the plover, the fern-owl. That is no evidence of lack of intelligence. The cuckoo's difficulty, or one of its difficulties, seems to be in the providing sufficient food for its ravenous young. A half-fledged cuckoo is already a large bird, and needs a bulk of soft food for its support. Three of them would wear out their mother completely, especially, if—as may possibly be the case—the male cuckoo will not help in feeding. This is the simplest explanation, I think; yet, as I have often said before, we must not always judge the ways of birds or animals or insects either by strict utility, or by crediting them with semi-supernatural intelligence. They have their fancies, likes and dislikes, and caprices. There are circumstances—perhaps far back in the life-history of their race—of which we know nothing, but which may influence their conduct unconsciously still, just as the crusades have transmitted a mark to our minds to-day. Even though an explanation may satisfy us, it is by no means certain that it is the true one, for they may look at matters in an entirely different manner from what we do. The effect of the cuckoo's course is to cause an immense destruction of insects, and it is really one of the most valuable as well as the most welcome of all our birds.

The thin pipe of the gnat heard at night is often alluded to, half in jest, by our older novelists. It is now, I think, dying out a good deal, and local where it stays. It occurred to me, on seeing some such allusion the other day, that it was six years since I had heard a gnat in a bedroom—never since we left a neighbourhood where there had once been marshy ground. Gnats are, however, less common generally, exclusive, of course, of those places where there is much water. All things are local, insects particularly so. On clay-soils, the flies in summer are most trying; black flies swarm on the eyes and lips; and in the deep lanes, cannot be kept off without a green bough. It requires the utmost patience to stay there to observe anything. In a place where the soil was sand, with much heath, on elevated ground, there was no annoyance from flies. There were crowds of them, but they did not attack human beings. You might sit on a bank in the fields with endless insects passing without

being irritated ; but everywhere out of doors you must listen for the peculiar low whirr of the stoat-fly, who will fill his long gray body with your blood in a very few minutes. This is the tsetse or cleg of our woods.

## RICHARD CABLE,

### THE LIGHTSHIPMAN.

#### CHAPTER XXII.—HOME !

As Josephine had made up her mind, and neither her father nor her aunt could move her to alter it, and the rector, from motives of delicacy, forbore giving his advice, the marriage was hurried on, and took place within three months of the funeral of Gabriel Gotham. As it must be, argued Mr Cornelis, the sooner it was over the better. To the great astonishment of the neighbourhood, Josephine was married almost as soon as gossip got wind that she purposed marriage. No sooner was she married, than she departed with her husband in the new boat, the *Josephine*, for a cruise to Holland and Heligoland and the Danish coast.

The neighbourhood was in some commotion, and consulted what was to be done. Such a case had not occurred before. Miss Cornelis was a lady ; Richard Cable, a common man. It was true that not much was known of the antecedents of Mr and Miss Cornelis ; but they were related to Squire Gotham, and she had inherited the Hanford estate. What was to be done ? Were Mr and Mrs Cable to be called upon ? How could the acquaintance with Mr Cornelis be maintained, if the neighbourhood agreed to ignore the Cables ? Metaphorically, every one looked at every one else to know what every one else would do ; and what every one else did, that every one else was prepared to indorse. What a pack of moral cowards makes up Society ! It is a herd of timorous sheep, bleating to one another to know whether the gap in the hedge is to be passed or not ; and when the general consensus is arrived at—Heaven knows how—where none will take the initiative, all run at the hedge-gap together, and wedge each other, in their eagerness to be not the last to push through. Sometimes a whole flock will hover about a gap, turning their stupid heads about to see whether they are surrounded by their fellow-sheep, and baaing queries to them, What is to be done ? backing a little now, when the sheep in front are bumped back by others ; then pushing forward, because the sheep in front ease away a little nearer the gap. Then an old ewe comes up and runs through, and in a moment all follow. The old ewe in the society round Hanford was Lady Brentwood, whom formerly Gabriel Gotham had admired.

‘ Bless me ! ’ said Lady Brentwood, ‘ she’s not committed a sin. She’s a right to please herself ; some like apples, others like onions. I shall call.’

Then all Hanford society said : ‘ We will call.’ And Hanford society having decided to call, went headlong to do so, before the return of the bride and bridegroom. Society said that it was its duty to call at the Hall after the death of Mr Gotham ; and Society was mightily inquisitive to know what Mr Cornelis thought of his daughter’s marriage, or rather, what sort of a face he put on it.

Mr Cornelis had a hold on that section of society which esteemed itself pious, for he was perfectly familiar with all the tricks whereby well-intentioned, simple, easily persuaded persons can be taken by the nose and led to the grindstone. He knew also how to make them hold their own noses to the grindstone, and smile sickly smiles, and give the signal to him to turn the handle. But he was not without influence with quite another section. He could tell a good story, was interested in horses, did not object to a bet, played billiards well, and was esteemed as a good fellow, without an atom of cant or humbug in him. Now the sporting men argued that Cornelis would be sure to influence his daughter, and it would be extremely awkward if she did not pay to the hunt as liberal a subscription as the old Squire. Then, again, these Cables had a yacht, and it would be agreeable to be invited for a cruise ; so they would call, and see to it that their womankind did likewise.

In early summer, there is an insect with eyes out of all proportion to its body, of a sickly colour, that attacks carnations, pinks, and other soft-wooded garden plants. It is provided with a proboscis, which it drives into the heart of the stalk on which it alights, and through this proboscis it taps the plant of its sap. The creature works itself up and down on its long hind-legs like a pump, and it succeeds in pumping the vital juices out of the plant, and throwing them in a mass of froth, like spittle, around itself. As this so-called Cuckoo-spittle insect acts on garden flowers so do our neighbours act on us, and we in turn act on them. When anything interesting and gossip-producing happens in our families, they come to us, attach themselves, drive their little tubes down some weak, soft joint, and suck out all the information they desire, and throw out what they have abstracted from us in a world of frothy chatter around them. If we are very shrewd and on our guard, it is interesting to watch these aphides trying us with their pipes—tap, tap here, and tap, tap there ; and if we wince by ever so much, in they go, up they kick their hind-legs, and work the pump as if they were extracting for themselves the elixir of life. But if we present to them an impenetrable skin, it by no means follows that they do not make froth-bubbles about us, only, instead of bleeding us, they extract all the requisite liquor from their own imaginations. It is almost incredible how very little liquor will spread into a very large bubble. An aphid will in a few minutes surround itself with a globe of foam many times its own diameter, and our social cuckoo-spittle insects are not behind the insect in their powers of making mountains out of nothing.

A good many of these aphides of society came about the Hall during the time that the Cables were away, to condole with Mr and Miss Cornelis on the death of Gabriel Gotham, and to

congratulate them on the marriage of Josephine. How they drove their taps! How they worked at the pumps, how they explored all the joints of the brother and sister! What froth-bubbles of gossip they exuded! Mr Cornellis was not easily sucked; but Aunt Judith was less impenetrable.

Mr Cornellis met all with a *bonhomie* and assumed frankness which turned every proboscis up. 'Girls are romantic creatures. Unfortunately, Gotham left her everything. That upset completely a head already disturbed by her nautical adventure. She had a foolish but generous idea that as she owed her life to the worthy fellow who had saved her in the great storm, she must devote that life to him. I will say this for him: he seemed overwhelmed with the gift, and half disposed to run away when it was proffered. The bequest of Gotham emancipated her from my control. Alas! girls—children generally, in this declining nineteenth century, are not obedient to their parents, but self-willed and self-determining. It was in vain for me to remonstrate. The girl had her high-soaring ideas, and they carried her away. We must make the best of a bad job; and I shall ask my dear friends and neighbours to assist me in lightening to Josephine the humiliation and disappointment which await her, and to exercise toward her and Cable that forbearance which I feel will be necessary.'

There was something grotesque in the way in which the visitors inquired after the Cables. They put their questions, made their remarks in a tentative manner, as if they did not know how to approach the subject with delicacy. It was as though Mr or Miss Cornellis were troubled with a boil, and the public mind was uncertain where the boil was situated, and whether it was consistent with strict propriety to inquire as to the condition of the boil; whether it were not most judicious to ignore it, and observe the movements of the party suspected of suffering from it, what sort of faces he drew when sitting or standing or leaning, and to speak cheerfully on ordinary subjects, and not seem to observe the anguish and pallor and twinges of the patient; but to be dogmatic upon the situation and condition of the boil to all the neighbourhood, when out of the house.

What a pitiful world we live in! How infinitely helpful we are to one another in the burying of family skeletons. We call on each other and take afternoon tea with each other, and know all the while that our hostess is covering with her skirts the unearthed bones, which she has been sorting and shivering over till she heard our carriage-wheels, when she dropped them all on the floor and kicked them under the chair. We know they are there, and we give the table-cover a little pull, to make it conceal a ghastly hand that is thrust out, and which our hostess does not see to be exposed. And we chirp about the weather, and laugh over some little local gossip, and go into admiration of the exquisite flowers on the table, so sweetly fragrant; while the smell of mouldering bones rises up and overwhelms the otto-like scent of the Jules le Fèvre in the vase. How daintily we tread in our conversation among the dead men's bones that strew the ground of our neighbourhood; and how, if we

happen to touch one, we stoop and scrape the earth together over it, laughing and chattering about matters indifferent, pretending that we are picking daisies. How persistently, when we are dining with our friend, we turn our back to the cupboard in which we know the skeleton is, and put up our eye-glasses to admire the picture opposite, and the china on the cabinet on this side and on that side of the one cupboard, and do not observe the existence of that one cupboard. How quickly, if some other incautious guest approaches it with inquisitive eye, we set our backs against it, and use every ingenious effort to divert his attention to other objects. What a fit of sneezing takes us, and makes us turn away our eyes, when our friend, incautiously pulling out his handkerchief, lets fall a bone; and whilst we turn our eyes and noses away into our own pocket-handkerchiefs, we know he is picking up and reconcealing that bone inadvertently exposed. Is it said that every man has a skeleton in his closet? That proverb but half expresses the truth; every man has the bones all about him—in his breast-pocket, in his fob, in his purse, in the lining of his hat, in the tails of his coat, in the toes of his boots, like the Pilgrim in *Sintram*. It were well for him if he could confine his skeleton to the cupboard. But skeletons refuse to be so confined; they come to pieces, however well wired together the joints may be, and disperse their fragments everywhere, playing us grim practical jokes, turning up from under our pillow, dropping on us from the ceiling, tripping us up as we are stepping downstairs, lying beside our plates when we expect to take hold of a knife or fork handle. That is why we are so dependent on the good-will and courtesy of others, and have to ask them to put their feet on our bones, or turn their heads aside a moment, when they turn up inadvertently.

Pitiful and considerate though we may be when in the presence of our friend, our pity and consideration fall off us the moment we have left him. Then we run to our other neighbours and call them together, and peep and whisper, and point where the bones are hidden, and tell their nature and condition; and put out rakes, and scrape them out of the earth, or rap at the walls and knock holes, through which we may peep at the grinning skulls behind. How the nature of these bones changes according as we look at them in the presence of the owner or of others! In his society, we scarce see them, and hide our eyes; but when we draw them out and turn them over in social talk with others, what merry-thoughts and funny-bones they prove to us! How we titter over them! What figures we build up out of them, how we dress them with grotesqueness! How we treasure them! If we happen to carry off a neighbour's skeleton bone, we are not like selfish dogs that run and bury their bones lest others should bite them also; but we go generously about with the bone to every kennel within our run, and show the bone to every dog, and invite him to sniff at it, and take a nibble and play with it, rolling it over, pawing it, licking it, tossing it about. Then snap! we have caught our bone, and away we go with it to the next kennel to repeat the same generous sport.

Mr Cornellis was far too well versed in the

ways of the world to attempt to conceal his skeleton, to affect ignorance of its existence. He brought it out; he dressed it up; he exposed it to the full view of every visitor; he said as much as: 'Don't content yourselves with a bone of it. Carry the whole ghastly thing away with you in your carriages, beside you; or perch it on your saddle, if you are riding; and sit behind and hold it up, and show it to every one, clattering and nodding its hideous head, as you go through the streets. Or, if you are walking, unhitch all the joints, and stow it away about you. Fill your coat-tail pockets; stuff your hat with it; cram it into your waistcoat; open your mouth and choke your cheeks with it; extend your hands, and grab all you can of it; leave none behind; take all with you, and be welcome.' Dom Pedro of Portugal, when he ascended the throne, dug up Inez de Castro, to whom he had been secretly married, and had her skeleton arrayed in royal robes, and crowned and enthroned in the cathedral choir; then summoned all the nobility and clergy and courtiers to do homage to and kiss the withered hand of the corpse. And Mr Cornelis brought forth his skeleton, and invited every one to see it, and commiserate him openly on being encumbered with it, and even to join with him in a dismal joke over its existence.

His conduct in the matter took the sting and spice out of it, put the neighbourhood in good-humour, and prepared it to accept Josephine as one who had made a blunder, and must be helped to repent it. Cable would be quietly snubbed and thrust aside; his wife made much of, and pardoned, if she consented to keep her husband in the background; or, what would be better still—at sea.

Mr Cornelis had considered well what was best to be done, and by the time the young couple returned, all the country round was ripe to receive them on the terms he proposed.

The *Josephine* arrived at Hanford a day or two before she was expected. A sailing yacht does not come into port to the day like a steamer, nor can the best of vessels be punctual to a minute, as a train is supposed to be. The bride had written to her aunt to say in what week she would be home; but instead of arriving at the end of the week, as Miss Judith expected, the boat came in at the beginning. None of the servants of the Hall were on the beach to receive her; her father and aunt were away that day making purchases at Walton, and did not know that the vessel had been sighted by the coast-guard. Though her own relations and servants were not awaiting her, Josephine found that Richard had his friends on the shore, ready to shake hands with him, pat him on the back, and ask with a 'Halloo! old chap!' how he got along.

There was Joe Marriage, in wading-boots up to his thighs, and a dirty jersey of faded blue darned with black and brown, and a sou'-wester hat. His hands were fishy; he had been handling oysters. 'Well, Dick! Brought your missus home. Look alive, and introduce us to the lady.' Then, extending a very dirty flat hand, he grasped and shook that of Josephine: 'Glad to see ye, ma'am. Going to make a gentleman of Dick, are ye? 'Tain't possible, say I.'

Then up came Sam Bucket, curious like the rest of them. 'So, missus! you're back right with your chap. Not made him look much thinner. Which is it to be? Are you agoing to haul Dick Cable up to your level, or be you a-coming down to ourn?'

A gawky young fisherman, Tom Dowse, came staggering up with a pail of shrimps and set it down at Josephine's feet. 'There, my dear,' he said. 'You may take it home and sup on it, and be heartily welcome.'

'Come, missus,' said Jonas Flinders, who was half-tipsy, 'you're one of us now, you know, and so shake a flapper. None of your airs;' and then he made a broad joke which brought the colour to Josephine's cheek. The rest laughed. Richard did not hear it; he was shaking hands and receiving congratulations from one of the coastguard, a few paces off. Jonas meant no offence; he would have used the same coarse expression before his own wife and daughters unbribed. It was customary in his class of life for men and women and lasses to be outspoken, and not mealy-mouthed and nice about what was said or heard.

Josephine drew back. She was offended, and one or two of the others saw she could not stomach such talk; so they explained that Jonas was fresh, and when fresh, a loose-tongued chap, but good-hearted, and a fine sailor.

'If some of you will carry my traps to the Hall,' said Josephine stiffly, 'you shall be paid for it.'

'O hang it,' said one, 'we'll carry your parcels without payment; but we'll make so free as to ask you to give us a glass of grog in your kitchen to drink your health and success to your voyage through life with Dick for your captain.'

Josephine again looked round for her husband; but as he did not come to her, she moved away towards her home. One of the men had her bundle of rugs; another hoisted a portmanteau on his shoulder; a third carried a roll of umbrellas, waterproofs, and a yellow railway novel; and a fourth tucked a tin bonnet-box under his arm. The tiresome, tipsy Jonas would keep near her and talk in a familiar manner, and diffuse about him an odour of stale tobacco and beer. Escorted by these men, sensible that she cut a ridiculous figure, annoyed by the well-intentioned importunities of Jonas, vexed that none of her own servants were at the landing-place to receive her parcels, Josephine approached her home near in the best of tempers. As she entered the grounds, her father and aunt arrived in an open carriage. He was driving; and he drew up and waited, with an amused expression, till she came near, when Jonas, tripping on the stone in the entrance gates that received the bolt of the double doors, sprawled in her way at her feet, and upset the pail of shrimps he carried, so that the creatures were scattered in all directions over the drive. His accident elicited a general roar. Josephine turned a deeper colour than the shrimps.

'Where is Mr Cable?' she asked impatiently.

'Lor, missus!' shouted Jonas, trying in vain to recover his upright position, 'he's gone after his kids, o' course, like a loving father to his poor orphans.'

'Come along, my men,' said Mr Cornelis with

a laugh which cut Josephine like a knife. 'Round to the back-door, please, and I will order you all out some ale. The front-door is only for Mr Cable, by permission of his wife.'

(To be continued.)

### PIKE LORE.

No British fish possesses so marked an individuality as the pike. Without the beauty and the spirit which distinguish the salmon and the trout, it affords, notwithstanding, excellent sport to the angler on account of its large size and the eagerness with which it seizes the bait. The English name, pike, is supposed to have reference to the pointed shape of the head; the French term *brochet*, or spit, denoting a similar origin. The Latin name, *lucius*, derived from the Greek *lykos*, or wolf, aptly designates 'the fresh-water shark or wolf,' as he has been justly termed. Various points have been discussed for ages with regard to this fish, without any apparent unanimity of opinion being arrived at. The age, size, and weight to which individual fish have attained have formed material for conjecture since the time of Pliny. A story is extant, that in 1497 a pike was taken from the Kaiserweg Lake, in Germany, with a brass ring encircling its neck, bearing the inscription: 'I am the fish which was first of all put into this lake by the hands of the governor of the universe, Frederick II., the 5th October 1230.' It is also on record that in 1610 a pike was taken in the Meuse bearing a copper ring, on which was engraved the name of the city of Stavern, and the date 1448. Naturally, the authenticity of such accounts is extremely doubtful, though Mr Pfennell in his admirable monograph on the Pike considers a portion of the former legend as resting on some foundation. There seems every reason for believing that the pike will attain the age of seventy or eighty years under favourable conditions. The subject of weight is equally disputed. A pike of thirty or forty pounds may be considered as exceptionally large for ordinary waters; but at times fish of a much greater weight have been captured. A pike taken in Loch Ken, in Galloway, weighed seventy-two pounds; and fish of ninety pounds are said to have been captured in the Irish lakes. In Southern Germany, larger specimens are occasionally exposed for sale in the markets.

Owing to the rapidity with which it digests its food, the large size of its mouth, and the number and sharpness of its teeth, the pike is well qualified to play the rôle of an exterminator of smaller fish. It is supposed that at times he will consume his own weight of food in a day. Nor are smaller fish his only prey; waterfowl, rats, frogs, worms, and even weeds will in turn form portion of his diet. Like the larger trout, the pike feeds frequently on his own species; and there is no better bait for a very large pike than a three-pound fish of the same kind. The late Mr Foster, in his *Scientific Angler*, gives an interesting account of the capture of a large pike by this means: 'We were fishing in preserved water in a neighbouring western county, and had

hooked a pickerel a few pounds-weight, which we were about to land, when the gleaming broadside of some larger relation of the family shone in the background an instant, and then a heavy tug demonstrated the fact that our possession of the prey was disputed. We were in sole possession of a light punt upon an extensive sheet of water, and thus having plenty of searoom, we were rather confident of the result. At the first gentle touch of the rod, the fish ran out fully half a hundred yards of line at one impetuous rush, despite the heavy strain placed upon the rod. To reserve the remainder of our line would tend to aggravate the danger; to let it run meant disaster. Whilst we hesitated, we unconsciously stopped further supply of line, of which fact we were reminded by the rapid motion of the punt through the water. As we resolved to break away from him, he suddenly doubled, making straight for the punt; the next instant, he dashed off with renewed vigour at right angles, and we again strained heavily upon every foot he stole, despite which, our whole stock was all but spent before he again turned. For more than an hour was this operation of hauling in and paying out the line repeated without ceasing, at the end of which time the tragic end seemed as remote as ever. By this time, several stable functionaries from the mansion arrived upon the scene, among whom a learned controversy ensued as to the probable weight and breed of a fish capable of towing a man and boat with impunity. As the fish swerved along shore in their immediate proximity, all dispute suddenly dropped, and we observed a large stable-fork in possession of a bandy-legged individual who had stepped forward, fork in hand, ready for action. Before we could interfere, a wild thrust was made, which fell short of the mark, but, nevertheless, well-nigh ended the fight, the terrified fish making for less dangerous quarters at a speed that eclipsed all previous exploits, the pressure upon the line availing little beyond keeping the snout of the fish above the water's surface. After this rush, a reaction set in, the fish showing signs of fatigue for the first time, which speedily developed into complete exhaustion. To consummate the capture by gaffing was now a very easy matter, and was soon accomplished. The weight of the fish proved to be thirty-seven pounds and three-quarters. It was preserved and encased by the owner of the water, with the tail of the pickerel protruding from its extended jaw.'

Nor have human beings been always free from the attacks of large pike. A surgeon of our acquaintance had on one occasion to dress no less than seven wounds upon the hands of a boy who had been severely bitten by a pike whilst bathing in Inglemere Pond, Ascot. It was only after a severe blow upon the head that the fish desisted from its attack. This pike, which was found dying the next day from the effects of the blow, and which was probably half-starved at the time when it made its murderous onslaught, measured more than forty inches. An equally curious account of a pike pressed by the pangs of hunger is given by Mr Henderson in his *Life of an Angler*. A gentleman well known to him had obtained permission to fish in a private lake in which it was supposed that pike existed. The angler after having trolled round the lake

for a considerable time without getting a 'run,' had almost arrived at an opposite conclusion, and was on the point of quitting the spot, when he noticed a pike of some eight pounds-weight, evidently on the lookout for food. He threw his bait towards the fish, which eagerly accepted it, and was dragged to the shore. It then occurred to the angler, that as few other fish seemed to inhabit the lake, he would have no more sport, should he destroy that which he had captured. Accordingly, he threw the fish back into the water; and on its again taking up its station close to the bank, as if on the lookout for food, once more threw in his bait and captured it. The same process was repeated five or six times, though on each occasion the fish seemed to become less desirous of seizing the bait. Finally, the pike was killed. Mr Henderson gives full credence to this story, on the grounds, that his friend was incapable of falsehood, and that a somewhat similar instance of pike-voracity had come under his own observation.

Probably, as Mr Henderson observes, the fish was on the point of starvation, and could not resist seizing the bait, even though previously pricked by the hook. An instance is on record of a fox being seized by a pike and carried beneath the water; while in Sweden, an eagle and pike have been found dead together, the eagle doubtless having buried its talons in the back of the pike whilst basking on the surface of the water, and having thus been carried below and drowned. In the Avon, on one occasion, a gentleman who had set a night-line, found a heavy pike one morning apparently fast to the hook. On opening the mouth of the fish, he found another pike within the first, and within the second fish a third weighing about three-quarters of a pound. The last fish had been swallowed by another pike, which in turn had been swallowed by a still larger fish!

Lord Walsingham recently, in presiding at the dinner of a Norfolk Angling Society, mentioned having shot a partridge, which on falling into his lake was seized by a pike. The following day he proceeded to the spot, and whilst fishing, succeeded in taking the pike, which contained the bird. Only last year a pike was captured, which, on being opened, was found to contain a snipe and a small pike, the latter in turn containing a small trout.

As may be supposed, few fish are exempt from the attacks of this scourge of the waters. The perch probably escapes oftener than others, owing to the spines of its dorsal fin, which render it an unpleasant article of diet to the pike; while, from some unexplained cause, the tench, unlike its congener the carp, seems to be untouched by carnivorous fish. A singular fact in connection with the pike is its habit of suddenly appearing in ponds in which it did not previously exist. Experiments which have been made would seem to point to the inference that this fish, like the eel, will travel overland for a short distance through wet grass, to reach water. An instance of this kind once happened at the Zoological Gardens. During the night, a tank in which a pike was confined burst, and the pike being left dry, was found in the morning by the keeper making its way along the path towards a pond at some distance. When picked up, it had

already gone some twenty yards, and seemed to have sufficient strength left to accomplish the remainder of the journey.

As an article of diet, the pike seems to have varied in estimation at different times. At one period it seems to have been preferred to the salmon as a dish for princes; at another, to have been considered fit only for the lowest in the land. The edibility of this fish depends much upon the locality, in which it has been reared. Thames, Medway, and Staffordshire pike have all been noted for their superior beauty and delicacy; while those of the Scotch lochs, and of lakes in general, are of an inferior description. Properly cooked, a pike, if well fed, is by no means to be despised.

## OLD STAIRS: A STORY OF LONG AGO.

IN SIX CHAPTERS.

CHAP. V.—RINGWOOD'S GOLD.

THE young sailor—for it was Mark Ringwood who had come into Caleb's house with the rush of wind—was the first to speak. 'Is this gentleman your grandfather, Miss Pearl?' said he, with an inquiring look at the young girl. 'Is this Mr Caleb Cobb?'

The girl blushing bowed her head.

'Mr Cobb,' resumed Mark, turning to the old lamplighter, 'I was fully prepared for your anger. My voice reminds you—and you are not the first it has reminded—of Mr Ringwood, late of the firm of Rudstone and Company. I'm his grandson, Mark Ringwood; and knowing what I know of his dastardly conduct—there is no other word for it—I am almost ashamed to own the relationship. But he is dead now, and his last words to me were: "Do not rest until you have found Caleb Cobb and delivered my message." He felt confident, he assured me, that you were still living, and somewhere in this neighbourhood.—Will you listen,' added the young sailor, 'to what I have to say? I'm a man of few words, so I shan't tire you.'

Caleb sank submissively into his armchair. 'Dead?' he muttered.—'What did I tell you, Pearl? Dead!—I'm not superstitious,' added the old man, 'not about most things; but I knew that I should hear of this to-night. I heard his footstep—his voice—as I sat thinking at the old gateway.—Well, what's the message?' and a change came into his tone. 'I'm listening. Get it over, and quit my house. I want none of his kith and kin hanging about me or mine. I'm listening.'

Is it possible that Caleb Cobb, thinking of Pearl, imputed a hidden motive in this visit on the part of the young sailor? He was keen to hear and quick to interpret every movement or sound which reached his ear. Pearl had described this messenger to him in a hesitating voice—described him as young and handsome. That was enough to rouse suspicion, and fill the old man's brain with fresh forebodings. He

called the girl to his side. She came at once, and rested her hand in her caressing way upon his shoulder, but with her face turned towards the visitor.

Mark Ringwood, receiving no invitation to draw near the hearth, still stood with folded arms, leaning his back against the door. His face clouded slightly at Caleb's irritable tone; and he answered, after a moment's pause, with some degree of resentment: 'I'll not trouble you with my presence a second longer than I can possibly help. I've delivered the sealed packet already. Your grand-daughter is holding it in her hand, I see, and the seals are still unbroken. It contains a few words from Mr Ringwood, and the sum of one thousand pounds.'

'What! Has he confessed his treachery at last?' cried Caleb.

'Yes—at last,' replied the sailor. 'He has confessed to having supplanted you in the house of Rudstone, Marling, and Company. He has confessed that, but for his wicked plot—a plot which so completely succeeded—you would have been a man of wealth and position. With his dying words, he implored your forgiveness.'

'Ah! Did he think to gain that?' and Caleb's voice was full of bitterness and sarcasm.

'In his last will and testament,' Mark Ringwood resumed, in a more formal manner—'in a document which is now in the hands of his executors in London—he has bequeathed one half of his property to you, Mr Cobb, or your heirs and assigns, as the lawyers tell me, in perpetuity. The other half he has left to me, his only surviving relative. Or rather, I am, I think, what they call residuary legatee. At anyrate, a specified sum has been left to you—a sum of fifty thousand pounds—and I'm to have the rest.—And all I can say is,' added the sailor, 'that if you had inherited every penny of the property, Mr Cobb, it would not have been, from what I understand, more than you'd a right to.'

Caleb Cobb, listening intently, but with a gathering cloud on his wrinkled brow, rose to his feet, trembling with passion. 'What mockery is this?' cried he with clenched hands. 'What do I want with his ill-gotten gold?'

With a restraining hand upon his arm, Pearl appealed to him in a soft, persuasive tone. 'Dear grandfather, is this young man to blame? It is his misfortune, not his fault, that he is related to the man who has ruined your life. Do not speak so harshly to him. Nothing could be more noble, more gracious, than his attitude. No sacrifice would be great enough'—

'Silence! I'll not hear another word,' interrupted Caleb, by no means soothed by Pearl's defence.—'Do you suppose that anything can compensate me for the dreadful suffering that I've endured for fifty years? Can money—do you suppose—can money do it?—No! I'm an old man—nearly fourscore and ten—and as poor, Heaven knows, as a church mouse. But I'd rather starve—and I'd rather see you starve too—than be indebted to Ringwood, or his relations, for a crust of bread!—Where is the sealed letter, Pearl? Give it back to the young man, and let him leave the house. He may be honest enough;

I know nothing about him. But his presence drives me mad: his offer of money is an insult.—Give it back to him at once.'

'I cannot,' said Mark—'I cannot take it back. It's yours.'

'Mine!—Do you wish to see it burnt?' said Caleb. 'It shall be, if left in this house.—Do you hear me, Pearl?'

'Grandfather!—Burn a thousand pounds?'

Caleb stood silent for a while, with his head bent and his hands pressed against his brow. At last he muttered in a changed voice: 'I'll talk to John about this. Ay, ay, I'll talk it over with him to-morrow. I'm not in my right senses to-night—no, no; not in my right senses. John shall say what shall be done—John Jarvis shall decide.'

'Will you,' cried the young sailor, with ill-concealed delight, 'will you let him see the lawyers and settle this affair?'

'Ay, ay; he shall decide,' repeated Caleb.—'Now, go!' he added with an angry gesture.—'Don't speak—don't let me hear your voice: it haunts me like a voice from the dead!'

When Mark Ringwood was gone and the door was bolted behind him, as though he were a dangerous character, Pearl took her place near the hearth beside her grandfather. He handed her, with an air of resignation, the sealed packet. 'Break the seals,' said he. 'Let this dead man, Ringwood, justify his conduct, if justification is possible, and then I will ask forgiveness!—Well?'

Pearl spread out the envelope upon the table. 'The packet contains ten bank-notes. The notes are each for one hundred pounds.—Ah! And here is a document,' the girl added, 'written in such a queer hand!—Shall I try to read it, grandfather?'

'Ay, ay; read it, Pearl.—Ten bank-notes, eh? Well, well.'

The girl then read as follows: 'I, William Ringwood, do hereby solemnly declare that Caleb Cobb is innocent of the theft imputed to him on the night of the thirtieth of March seventeen hundred and eighty-nine. The robbery was committed by me, the aforesaid William Ringwood, with the sole object of injuring Caleb Cobb, whose position in the house of Rudstone, Marling, and Company'—

The old lamplighter suddenly raised his hand. 'Stay! I have heard enough. He has confessed!—But what good, now, is all this to me? It only makes regret and the thought of all my misery the more galling. This avowal has come too late—fifty years too late! It cannot bring my old sweetheart back to life—it cannot give me youth and hope. Too late!' repeated Caleb—'too late!' There was a long silence; at length the old man said: 'Put away this packet, Pearl.—Put it in my old desk,' he added. 'It is the desk into which he slipped the thousand pounds upon that dreadful night. It was there that Mr Marling found the money, in that house in the Minorities which I once pointed out to you. I repurchased that desk, years ago, at a sale. It helped to keep alive—if that were needed!—my undying hatred for William Ringwood.—Ah, well, he continued, suppressing a sigh, 'we'll talk no more about that to-night.'

A fatigued expression had come over his face;

and Pearl, seating herself at the table over her needlework, was only too glad to let this painful subject drop.

The mystery of her grandfather's life had now been made clear to her; and as she pondered in her mind all that had happened since she had returned to their poor home this very evening, Pearl could scarcely realise the great change which might come over their lives within the next few days. A large fortune—if her grandfather could be persuaded to look rationally at the matter of which Mark Ringwood had spoken—would now fall into their possession—a fortune such as Pearl in her most romantic mood had never thought about before. Fifty thousand pounds! What scenes of happiness the mere mention of such a sum raises up in one's imagination! Could any one in their dependent position refuse such absolute independence? The poor girl had worked since she was very young, and worked hard too, in order to keep her grandfather and herself in this little home in Old Stairs; so no one knew better than Pearl did what poverty meant. It was but natural, under existing circumstances, that she should fervently wish to be released from this struggle for life, in which it had been her lot to take an active part from her earliest childhood. Nor was this the only romantic incident—this chance of fortune—which had occurred to-day. The meeting with Mark Ringwood upon the jetty in the storm, and her timely assistance in rescuing him from his dangerous position among the barges, had excited her interest in the young sailor. The subsequent discovery that he was related to the man who had wronged her grandfather had not prejudiced her against him; on the contrary, she regarded it as an unlucky accident. Did he not on that account merit her warmest sympathy? In her true, womanly heart, she could not withhold it from him. Mark Ringwood was not to blame.

#### CHAP. VI.—DREAMING AND WAKING.

Is it night? Caleb Cobb is listening intently—as it seems to him—but he hears no sound—no sound of the traffic in Thames Street hard by, no sound of the wind without. He gropes his way towards the window. It is night—silent, mysterious, and pitch-dark. Have the lamps been blown out by the gale? Standing there with this consciousness of the silence and darkness without, Caleb Cobb becomes accustomed to a strange, dim light within the little room—the room in which he has lived so long, and has not seen since Pearl first crept into his heart and home, seventeen years ago—a dim light from the flickering fire, for the lamp in the window is no longer burning. His first thought is to look for Pearl. But she is not here. He is alone; and yet there are tokens of her sweet presence on all sides. Where has she gone?

How warm and snug the room appears! There are signs of poverty, but none of discomfort or neglect. On the clean dresser stand the old plates and dishes as Caleb remembers them years ago. How they shine as the reflection from the fire falls upon their brightly polished surface! Then the light from the fire flickers upon the old oaken desk. Ringwood! He starts and listens once more, and then hastening to the door looks out

into the night. He looks out upon a darkness so intense that he has a passing sensation of blindness. Every lamp in the old city streets has gone out!

Closing the door, with a sense of despair, Caleb is directed by a faint gleam along the floor towards his old ladder, lying against the wainscot; and over it, suspended by a nail, is his hand-lamp—the lamp with which he had dotted jets of light along the way, night after night, down Thames Street and the adjacent lanes and alleys. With an eager hand he reaches down this lamp, and begins to trim it as he has trimmed it a thousand times before. This done, and the wick well kindled, Caleb puts on a tight-fitting fur cap and a pea-jacket, which he takes from a cupboard in the wall; he then shoulders his ladder and steps out resolutely into the darkness. As he goes along, he stops at every lamp-post, adjusts his ladder, runs up nimbly, and ignites the flame. And so, step by step, Caleb advances, and the shadows fall back like phantoms—phantoms that compel him to follow them along the deserted thoroughfare; and on each side the old houses—every brick of which he knows so well—with their gabled roofs and their overhanging stories, appear to frown down upon him as he hurries on as though urged by some fixed purpose—a purpose that must be accomplished in the dead of night.

Out of a shadowy courtyard, by which Caleb presently passes with hand-lamp and ladder, comes a tall shadow like a restless spirit, and touches the old lamplighter on the shoulder.

'John Jarvis? Is that you?'

'Yes. Give me your ladder,' is the answer, 'and your hand-lamp. There is light enough now.'

'Ay, ay; so there is.—Do you guess why I've done this?'

'Yes. You are searching for Pearl.'

He places the ladder against the wall in a corner of the gloomy yard, and blowing out the hand-lamp, drops it into his pocket. He then leads the way back through the lonely lighted thoroughfare. Caleb follows. They glide along, glancing up one street and down another, until they reach a dark doorway with an oaken, shell-shaped canopy overhead. The tall shadow stops, and beckons to Caleb to step into this doorway out of the lamplight. The row of houses opposite, as it seems to Caleb, takes the shape of Old Stairs; and up and down the jetty, with the river beyond, two figures are walking arm in arm. Their whisperings find an echo under the oaken shell.

'Is it wrong, then, to love you?'

'Grandfather thinks it is.' The voice is Pearl's.

'But you?'

The answer being very subdued, finds no echo.

'It matters little to me'—the voice is Ringwood's now—'what others think, so long as you care for me. I do not fear his anger, except for your sake. Are we not both young? I am willing to wait—until'—The sentence is broken and unfinished in the echo; but Caleb understands, for he makes a movement as though to step out into the lamplight. But the shadow at his side places a hand upon his shoulder and whispers in his ear: 'Not yet!'

The two figures continue to walk up and down before the old houses, still arm in arm; but their voices are only audible, under the oaken shell,

like a low murmur. Caleb, however, has heard enough—Ringwood's grandson is Pearl's chosen lover!

Outside Caleb's house, at last, they take leave of one another. Pearl has disappeared, and the door is closed behind her.

'Follow me!' and the shadow moves along under the lamps, leading the way towards the river below Old Stairs. They reach the edge of the jetty in time to see the young sailor step into a boat and begin to unfasten the cord attached to the iron ring. Unobserved, they take their places in the stern; and scarcely are they seated, when the boat, impelled by an oar, darts into mid-stream. The young sailor plies the sculls vigorously, and the boat soon makes headway against the tide. So intense is the gloom, that Caleb touches the shadow at his side, to convince himself that his ghostly companion has not vanished. There is no sound, except the splash of the sculls and their grating noise, and the gurgling of the water at the sides.

Caleb whispers: 'John Jarvis? Where are you leading me now?'

'Listen!' is the reply in a whisper like his own. 'I love Pearl, and I cannot live without her. This man, Mark Ringwood, has come between us. I have vowed—and I will keep my vow—to send him back to sea. He shall start on his voyage to-night.'

Caleb grasps his companion's arm. 'No, no. Spare his life!'

'What! You do not wish him drowned?'

'It's too horrible,' Caleb answers with a shudder, and a glance towards the dark figure working at the sculls.

'Pearl will be his wife.'

'His wife! I would rather she were dead.'

'So would I! She will be his wife, unless we do this deed. It is the hour!'

The droning sound of a great bell floats tremulously over the dark river.

'Midnight!'

At the same moment, the shadow at Caleb's side springs forward; there is a struggle, a discord of angry voices, a rocking of the boat, and a loud splash; and then something shapeless floats away with the tide.

Caleb, stretching out his arms, falls heavily forward.

Had he fallen into the bottom of Ringwood's boat? or had he dropped out of his armchair upon the hearthrug before the fire at Number One Old Stairs? Caleb, groping in darkness, cried out: 'John, John! he will be drowned.'

'Why, grandfather, what are you dreaming about?'

When Pearl had helped him into his chair—for Caleb Cobb had slipped out of it in his sleep—the old man rubbed his poor blind eyes and said: 'Dreaming? Ay, ay; I must have been dreaming badly. I never had such a nightmare in all my life.—What o'clock might it be?'

'St Paul's has just struck twelve.'

'Midnight? Why, that was in my dream.' He began to ponder deeply, passing his hand across his brow. 'Pearl,' said he presently, 'is my old ladder in its place!'

'Yes; it is lying upon the floor, where you have always kept it as long as I can remember.'

'And the hand-lamp? Is that hanging up?'

'On the nail above the ladder.'

Once more Caleb became thoughtful. But after a short pause he again questioned Pearl. 'Look,' said he—'look out into the night. Are the lamps still burning?'

The girl went to the window and looked out. The night was dark, and the gale had not abated. 'Yes; the lamps are still burning.'

Caleb questioned the girl no more. And Pearl noticed, as the days went by, that a marked change had come over her grandfather. The restless wanderings about Thames Street and the neighbourhood, when the lamps were lighted, were never repeated. The old lamplighter seldom quitted his chair except to walk feebly up and down the room, and sometimes take down his hand-lamp from the wall and caress it, as a child might caress an old toy.

The light which he had trimmed and placed every evening in the window was forgotten. His memory, indeed, was no longer reliable. Sometimes, when John Jarvis spoke to him of Ringwood's will, and of the wealth which had been left him by his prosperous enemy, he would listen to all that he had to say with an expression of keen comprehension. At other times, his face grew perplexed, and his understanding was strangely confused.

'John,' said he, when alone one morning with Jarvis, 'who brought me that news about Ringwood's death?'

'His grandson, you know, the young sailor.'

'Ay, ay;' and then he added in an anxious whisper: 'Does Pearl know that he was drowned?'

'Drowned, Mr Cobb?'

'He went out, John,' Caleb answered, 'with the tide.'

Jarvis, puzzled by this apparent hallucination, questioned the old lamplighter. It then became evident that his dream upon the night of the storm had made so strong an impression upon Caleb's mind, that he could not separate it, except at lucid moments, from the events which had actually happened.

Some months elapsed; and Pearl, quick to observe the slightest change in her grandfather, could not hide from herself that he became more feeble every day.

'The lamp is going out,' Caleb said one summer evening, 'and I've not strength enough to trim it any more.'

That very night, however, he surprised Pearl by expressing himself with a clearness of comprehension such as he had not exhibited for many a day. He spoke to her of Mark. He had fancied, he told her, that on the night upon which the young sailor brought the message—that message from Ringwood—that he loved Pearl. With this new trouble tormenting him—a trouble which, if possible, increased his hatred of the name of Ringwood—he had fallen asleep. His dream had been very strange. It had seemed to him that his eyesight was restored, and that he was a lamplighter once more, and that as he went along lighting the lamps in Thames Street, he had met the ghost of Jarvis, or what seemed like his shadow. Hidden within a doorway, they had observed her and Mark Ringwood walking up and down Old Stairs arm in arm. The moment the sailor quitted her,

they had followed him to his boat; and out in mid-stream, under cover of night, they had drowned him. This dream, he assured her, had preyed upon his mind. He had even imagined, when his head grew queer with thinking, that he had actually done the deed. 'My dear,' he concluded, 'that dream has been a lesson to me. Mark Ringwood is not accountable for the sins his grandfather committed. He bears the name of Ringwood; but that is no fault of his. Let that be forgotten; and if he should ever ask you to marry him—as I suspect he will, some day—and you should be willing to become his wife, do not let the recollection of my wrongs ever mar your happiness.'

Just before dawn, when the lamps in the old city were going out, Caleb Cobb expired. His love for Pearl, as his last words had shown, predominated over all the hatred which had rankled in his heart for more than fifty years.

Mark Ringwood had gone to sea in search of his ship the *Leander*, for a report had reached London that she had been wrecked off the east coast on the night of the storm.

One Saturday night, however, John Jarvis was seated in the bar-parlour of the *Loyal Tar*, when a ringing cheer in the lane outside startled him and his companions.

'Hoorah!' cried the ancient mariner with the wooden leg, jumping up and waving his long clay pipe in the air—'hoorah!—Don't you know who that is, Jarvis? Why, it's Mark Ringwood come back, safe and sound, with the shipwrecked crew!'

Before Jarvis could reach the door, to give Mark a hearty welcome, the young sailor had burst into the room followed by his brave shipmates.

There was a good deal of laughter and song and clinking of glasses at the old tavern that night. In the midst of all this jollity, Mark Ringwood turned to Jarvis and said: 'What news, mate, of the old lamplighter?'

'The armchair is empty.'

Mark looked grave, and asked with an anxious face about Pearl.

Jarvis told him that she was still living at the little house in Old Stairs.

'How is that?'

'Nothing,' replied Jarvis, 'would induce Caleb Cobb to touch a penny of your grandfather's money. Pearl is not less scrupulous on this subject.'

'That's odd,' said the young sailor. 'I've not touched a penny of the money either! And I don't mean to,' he added, 'until Pearl sets me the example.'

'Ah!' said Jarvis, 'you'll have the Ringwood estate getting into Chancery one day, unless you and Pearl come to some sort of a compromise.'

Mark was quite of this opinion. So, upon the following morning, he paid a visit to Pearl; and before many weeks, they came to the best compromise, concerning Ringwood's gold, that can be made between a young and loving couple—they agreed to become man and wife.

Mark Ringwood retired from his seafaring life when he married Pearl. But their house was within sight and sound of the sea; and when the night was stormy, and the waves broke loudly

along the shore, they spoke together of that boisterous night on which they had met for the first time upon the wooden jetty at Old Stairs.

## THE MONTH:

### SCIENCE AND ARTS.

THE science of astronomy will presently mark an important epoch in its wonderful history. The conference of astronomers from all parts of the world which has recently met at Paris was formed to discuss a proposition which had been mooted some months back. This was the bold proposal to chart the whole of the heavens by means of photography—to produce a map of the stellar universe which, besides being a guide for the explorer of to-day, would be a most valuable record for the use of posterity, and an infallible means of discerning whether any of the stars can truthfully be described as 'fixed.' Charts of the stars have before been made by hand, which must ever remain marvels of human ingenuity and perseverance; but no handiwork can equal in accuracy the tiny dots marked upon the sensitive chemical surface by the light from the stars themselves. Each star marks its own place and its relative degree of brightness upon these wonderful charts; and more than this, stars which the human eye has never seen, and which it never can see, even when aided by the most skilled optician, are recorded by the photographic method. This last circumstance is one to marvel over, but it is a fact which cannot be gainsaid.

The question has often been asked, 'What is the radius of the circle of protection afforded by a good lightning-conductor?' A well-known German architect, Herr Schiller, has lately thrown some light upon the matter by the publication of facts which came under his observation last June. A pear-tree thirty-three feet high was struck by lightning, no protection being afforded it by a conductor which stood on a schoolhouse forty yards away, or by another one, one hundred and ten yards distant, which was carried to the steeple of a church more than fifty yards high. Both these conductors when tested showed that they were in excellent condition. From these data, the conclusion is drawn, that the area of protection round a lightning-rod is a space equal to twice its height.

By a patented American process, large types used by printers for placards and posters, and which were formerly cut out of wood, are now made from paper pulp by the help of suitable moulds. The pulp is dried, powdered, and mixed with an oily incorporating fluid, after which it is again dried and pulverised. The powder is pressed into the moulds, when heat is applied to make its particles cohere. The incorporating fluid is a compound of paraffin and drying linseed oil; and to prevent shrinkage or alteration of shape, the types are not removed from the moulds until they are perfectly cold.

The Central Station of the Birmingham Compressed-air Power Company is now rapidly approaching completion, and if all goes well, it will be soon delivering this new form of power to its customers to the aggregate extent of six thousand indicated horse-power. This amount

will be increased later on. The air will be carried in mains through the principal streets of Birmingham, and from these mains, service-pipes will be carried to the various workshops and houses supplied. Each consumer will possess a meter, so that the amount of power which he uses may be checked. It is obvious that this new method of supplying power from a central station will be a matter of very great importance to workers of all kinds. One great advantage alone is the possibility of driving a small steam-engine without steam, and therefore without the risks attaching to a boiler and its attendant furnace.

A French paper lately described the manufacture of artificial whetstones, which seems to have some points of novelty about it. The materials required are gelatine, fine emery, bichromate of potash, and water. Gelatine when charged with the potash salt becomes insoluble after exposure to light; the required operations have therefore to be conducted in a dark room such as a photographer might use. The gelatine, which must be of good quality, is mixed with its own weight of water and dissolved by heat. To this the bichromate—previously made into solution by means of water—is added, the correct quantity being one and a half per cent. Finally, emery amounting to nine times the weight of the gelatine employed is added to the mixture, which is subsequently moulded to any form found most convenient. The whetstones thus made are exposed to sunlight for several hours, when they become insoluble, and ready for use.

The various explosives which, like dynamite, owe their parentage to nitro-glycerine, have the great disadvantage of leaving behind them after explosion unpleasant and dangerous fumes, which produce headache and nausea in those exposed to their influence. In much-confined situations, such as the interior of caissons in bridge-making, much valuable time is often sacrificed in the endeavour to clear the limited working-space of this noxious vapour. For this reason, dynamite is now giving place to another explosive called Rackarock, which is free from the fault indicated. It has, too, some other advantages which are worth noting. It consists of two ingredients, a solid and a liquid. Neither of these is explosive in itself, and they need not be mixed until required for use. The solid is made up in the usual cartridge form, and is saturated with the liquid when it is required to assume its explosive properties. Rackarock is as powerful as dynamite, but far more safe to handle.

It has often been stated that scorpions and other venomous creatures have been known under circumstances of great irritation to kill themselves by inoculation with their own virus. From experiments which have been made by Professor Bourne, and published in the Proceedings of the Royal Society, it would seem that this notion is one of the numerous myths which have always clung about natural history, and which increased knowledge is gradually eliminating from that interesting branch of science. According to Professor Bourne, poisonous creatures can poison other creatures, but not themselves or each other. But non-venomous snakes, frogs, lizards, fish, and other low forms of life, quickly succumb to the deadly poison of their venomous kindred.

The cheap production of oxygen gas is a problem that has taxed the brains of many experimenters, and the solution of which will be welcomed in many arts and manufactures where intense light or intense heat is required. M. Brin has taken out several patents relating to a method which he has elaborated of obtaining oxygen direct from the atmosphere, of which it forms about one-fifth, the rest being inert nitrogen. The process is as follows: Retorts charged with anhydrous oxide of barium are brought to a certain temperature, when air is admitted to them. The oxygen is absorbed by the barium oxide, while the nitrogen escapes. The barium is then made to give up the oxygen absorbed, and is ready to receive a fresh charge. A Company, called Brin's Oxygen Company, has been formed in London to supply the gas, compressed in steel bottles, to manufacturers and others.

If we have to look to America for the production of ingenious machinery, we still find that elegant and beautiful things come to us from our French neighbours. We are reminded of this by seeing the description of a new form of clock which has recently been patented in France. The novelty of it is in the dial, which is made of parchment, and painted with garlands of flowers. Among these flowers are seen two bees, which literally flit from flower to flower; but while one gets round the dial in an hour, the other takes twelve hours to run its course. The parchment has no opening in it; and it puzzles many to understand how the busy bees can be made to move without any connection with the interior works of the clock. Here is the explanation: Just underneath the parchment face are the ordinary hands of the clock, each forming a magnet. The bees, being made of light steel, readily follow the paths of the unseen magnets below the parchment dial.

The coke-dust at gas factories is usually regarded as being almost a waste product, but the Lyons Gas Company are utilising it in a remunerative manner. The dust is washed, and afterwards mixed with tar and pitch in such proportions that, when moulded, it will retain a solid form. These *briquettes* are then sold at about thirteen shillings per ton for fuel. Coal-dust has for years been utilised in this way, but coke *briquettes* are new.

At a recent meeting of the Association of Public Sanitary Inspectors, Dr Alfred Carpenter made some remarks on the Theory and Practice of Disinfection, which, we trust, will serve to dispel many erroneous notions concerning that important operation. He said that the breath of a smallpox patient contains the germs of living protoplasm, which would take root if immediately transplanted to the membrane of a susceptible person; but if floated about in the air for a hundred yards, such germs will lose their vitality. Here we recognise the importance of isolation of the patient in such cases. He advocates the use of steam for disinfecting houses, in preference to carbolic acid, which tends to preserve the dormant germ from decay. The same remark holds good for alcohol; so that those who think that they render suspected water innocuous by mixing with it something stronger, are under a delusion. The best of all

disinfectants is bichloride of mercury (corrosive sublimate); and, according to Dr Carpenter, a solution of one part in five thousand parts of water will in a quarter of an hour destroy every living germ, dormant or otherwise, with which it comes into contact. One ounce of the corrosive sublimate would afford a solution of this strength when mixed with thirty-one gallons of water, the cost being about sixpence. It should be mentioned that the greatest caution must be exercised in dealing with this salt of mercury, for it is one of the most virulent poisons known to chemists.

Dr Stallard has brought before the notice of the San Francisco Microscopical Society the results of some researches which he has made relative to the presence of *Bacillus tuberculosis* in fowls. He asserts that he has found the liver, spleen, lungs, and other parts of a chicken infested with true tubercle bacilli, and expresses the belief that five per cent. of all the fowls offered for sale in San Francisco were affected in like manner. Nervous persons will note with satisfaction that the bacilli are destroyed by as low a temperature as a hundred and fifty degrees Fahrenheit; but a far greater degree of heat is necessary to kill the spores. The moral of the matter is, that food should be well cooked before being eaten.

Few people are aware of the unhealthiness of inhabiting a room where there is a small escape of coal-gas. When the escape is of any great amount, it is usually seen to, too often, with a lighted candle. But small escapes are only recognisable by their faint nasty smell, and are generally unheeded. Professor Corfield has lately related to the Society of Medical Officers of Health some of the cases which have come under his own notice, and where injury to health has occurred through sleeping in gas-contaminated rooms. Relaxed and ulcerated sore throat—generally ascribed to bad drainage—are among the symptoms recorded. Other subjects are afflicted with continually recurring headache. But such symptoms are present when people sleep in a room to which fresh air is almost a stranger. Those who sleep with open windows know no such ailments; and those who do not, may obtain immunity from them by adopting other methods of ventilation.

The steamship *Charles Howard*, owned by Messrs Alfred Stuart & Co., has been fitted with the necessary apparatus for burning residual oils in the furnaces, instead of coal (Tarbutt's system). But two improvements have been introduced, which cannot fail to be recognised as such by those who have studied the gradual advance of liquid fuels. As ordinarily burnt, these fuels were thrown into the furnaces by means of steam-jets, entailing a considerable loss of fresh water from the boilers. In the above-named vessel, highly heated air is employed in lieu of steam, and is found to answer the purpose in a most satisfactory manner. Another improvement is the employment of the water-ballast tanks as receptacles for the liquid fuel. The owners of this steamship are so pleased with the results of these improvements, that they intend fitting up the remainder of their fleet in the same way.

Our contemporary *Engineering* devotes an article to the description of a new method of extracting aluminium from its ores, which has

been invented and carried out by Dr Kleiner of Zurich. The apparatus is simple, and the entire operation occupies from two to three hours only. The operations required cannot be here described in full; but we may mention that the process is an electro-chemical one, and quite different from methods which have been previously adopted. As aluminium in its combined state is one of the most common things in nature, and as it possesses many valuable properties in its metallic form, it is to be hoped that the time is not far distant when it can be placed cheaply on the market. Hitherto, the expense of its reduction has been so great, that it was regarded as one of the rare metals, and was valued accordingly.

It is said that a cheap and ready means of waterproofing felt, cloth, leather, and other fabrics, is represented by the following simple process: Paraffin wax is heated, mixed with linseed oil, and cast into a block. This, when cold, is rubbed into the fabric to be waterproofed, which is afterwards ironed with a very hot iron, so that the particles of waxing material are distributed and urged into the pores of the fabric. By limiting the amount of waterproof mixture, the fabric may be rendered impervious to water, but porous enough to allow circulation of air. The process should be valuable to fishermen and others who are much exposed to the weather.

Baron Nordenskiöld is making preparations for a voyage of exploration in antarctic waters, which will be ready to start in the autumn. The king of Sweden and Baron Dickson—whose name is so well known as a munificent encourager of such enterprises—are said to take very great interest in the expedition. The explorers expect that the voyage will occupy about eighteen months.

Messrs Kellar & Allen of Cardiff have patented a piece of apparatus called the Invincible Coupling-bolt Extractor. For the information of those who are not engineers, let us endeavour to describe this contrivance by relating what it can do. The screw-shaft of a steamship forms a connecting link between the propeller and the engine, and is formed of several bars of metal, which by means of flanges at their ends are bolted together. Should any accident happen to the shaft—and such accidents are by no means uncommon—the removal of the coupling-bolts is a matter of necessity, and of very great difficulty. They stick so fast in their places, that often they have to be drilled out, an operation entailing much loss of valuable time. The Invincible Extractor consists of a pair of jaws which grip the flanges, and which, by a simple arrangement of wedges, cause the bolt to fly out like the shot from a gun. It is obvious that such a contrivance must have many other applications where heavy machinery has to be dealt with.

The new French explosive, *Melinite*, of which such wonderful things were anticipated only a few months ago, does not, after all, seem to be a desirable addition to the munitions of war. The terrible explosion of a melinite shell at Belfort, which caused the death of several workmen, is attributed to chemical decomposition, in consequence of the shell not having been thoroughly dried. The French government have now given orders that this dangerous explosive

is not to be used, and that all shells already charged with it are to be forthwith destroyed.

A paper read before the Physical Society by Mr C. V. Boys, M.A., on the Production, Preparation, and Properties of the Finest Fibres, afforded some interesting particulars concerning a new method of producing such fibres. Most people have seen the operation of glass-spinning, where the melted mineral matter is drawn off in a fine hair, and gradually formed into a silky skein upon a rapidly revolving wheel. But Mr Boys gets a far finer product by using a much higher temperature than is usual, coupled with a far higher rate of velocity. The oxyhydrogen flame he employs as the source of heat; and instead of using a wheel upon which to wind the glass, he attaches the end of the fibre to an arrow which is rapidly shot from a crossbow. By such means he has produced threads of glass measuring in diameter one-ten-thousandth part of an inch. In certain physical experiments, the possibility of obtaining a thread so delicate is of great importance.

According to an American medical journal, a number of the tonics and bitters which are sold as non-intoxicating drinks, and are as such brought under the notice of total abstainers, contain a quantity of alcohol ranging from six to forty-seven per cent. It is not inferred that the alcohol is purposely introduced; but that it is naturally generated in the bottles from certain ingredients, there is no doubt whatever. Home-made ginger beer, which is generally regarded as being as free from spirit as pure water, often contains a very perceptible proportion of alcohol.

'A rapid method of dry-mounting' was lately the subject of an exposition before the members of the Western Microscopical Club, by their secretary, Mr A. W. Stokes. Those who work with the microscope will know how difficult it is to mount specimens dry, as some must be mounted, and yet protect them from moisture, fungus, &c. The plan advocated by Mr Stokes is a simple one, by which such difficulties can be avoided. Upon a slip of glass or of metal, a small piece of wax—paraffin wax and beeswax equal parts—is placed, and melted by heat. To the warm liquid, the ring of paper, vulcanite, or other material which is to form the cell, is placed—first one side, and then the other, so that both receive a coating of the wax. The waxed ring is then placed upon the slip of glass which is to form its permanent resting-place, and heat is applied beneath. After the object is inserted, a warm cover glass is attached to the upper side of the ring, and a coat of varnish completes the operation.

For the past few years, there has been an outcry among artists to the effect that the Royal Academy requires reform, and that the falling-off in the quality of the pictures sent in for annual exhibition results partly from the circumstance that many of the best men do not care to send their works there under present conditions. It is perhaps possible that good-humoured ridicule may accomplish what serious protest has failed to achieve, and for that reason we regard with something more than amusement the 'Artistic Joke' of Mr Harry Furniss. In Bond Street, London, Mr Furniss has established

a 'Royal Academy' of his own, in which the shortcomings of the real Academy are set forth in the most humorous light. The pictures very cleverly take off the mannerisms of different well-known exhibitors, as well as caricature the portraits of nobodies which are of no interest whatever to anybody else. These are all drawn with their backs towards the spectator.

## STRANGE DUELS.

In the old days of duelling, nearly every one was affected by the mania—soldiers, sailors, statesmen, actors, and even members of the learned professions were ready at all times, and in fact in all places, with sword or pistol to settle a difference or to wipe out an insult. Drs Woodward and Mead fought under the very gates of Gresham College. Dr Woodward's foot slipped, and he fell. 'Take your life,' said Mead, loftily putting up his sword.—'Anything but your physic,' retorted Woodward; and thus the desire of these two disciples of Æsculapius to let blood terminated.

All duels, unfortunately, were not so bloodless as the last. Dr Millingen, in his *History of Duelling*, states that during the reign of George III. no fewer than one hundred and twenty-two duels were fought, sixty-nine combatants were killed, and ninety-six wounded, forty-eight of the latter dangerously. The list of fatal duels is capable of almost indefinite extension; but there is perhaps as much material in the more agreeable enumeration of disputes that have had a comic termination. Madailan sent a challenge to the Marquis de Rivard, who had lost a leg at the siege of Puy Cerda. The marquis accepted, but sent with his answer a case of surgical instruments, insisting that Madailan should first lose his leg, so as to place them on an equal footing. The joke stopped the duel.

Many duels have been prevented by the difficulty of arranging 'the how and when' of the business. In the instance of Dr Brocklesby, the number of paces could not be agreed upon; and in the affair between Dr Akenside and Mr Ballow, one had determined never to fight in the morning, and the other that he would never fight in the afternoon. John Wilkes, however, was one who did not stand upon ceremony in these little affairs of honour, for when Lord Talbot inquired how many times they were to fire, he replied: 'Just as often as your lordship pleases. I have brought a bag of bullets and a full flask of powder.'

One of the funniest duels was that in which Sainte-Beuve was engaged. It began to rain slightly, after he had taken up his position, whereupon he called for his umbrella, and opening it, held it over his head with his left hand, while with the right he held his pistol. The expostulations of the seconds had no effect upon him. 'It is all very well to be killed,' said the famous essayist; 'but I object to catching cold in my head.'

There is a story told of Perpignan, a literary bohemian, having an encounter with Charles Maurice at five paces. The former fired and missed. The other, taking deliberate aim, said to his antagonist: 'Well, now, before I send you into the other world, tell me what you are think-

ing of?'—'I am thinking that if I were in your place, I would not fire,' said Perpignan; and to this cool rejoinder he owed his life.

There is an anecdote related of an encounter between a French dramatic author and his critic, the latter of whom was a first-rate shot. After the author had fired and missed, the journalist accurately aimed at his adversary's hat, and pierced it with the utmost precision; whereupon the dramatist flew into a violent rage, protested that it was unfair, and exclaimed: 'If you had told me what you were going to do, I would have put on an old hat.'

That a man should lose his life through mispronunciation of a vowel seems hard; but such really was the fact. In the year 1718, Williams—a Welsh actor—and Quin were playing together at the Lincoln's Inn Fields Theatre in the tragedy of *Cato*, Williams playing Decius to Quin's Cato. The former entered with, 'Cæsar sends health to Cato;' but he mincingly pronounced the name of Cato, *Keeto*. Quin, who gave a broad classical enunciation to the letter *a* in the word, was offended, and instead of replying, 'Could he send it to Cato's slaughtered friends, it would be welcome,' he exclaimed, 'Would he had sent a better messenger.' The Welshman was boiling with rage, and when Cato resumed with, 'Are not your orders to address the Senate?' he could hardly help replying, 'My business is with *Keeto*.'—In the short scene, he had to repeat the name ten times, and each time it would come *Keeto*. Quin had to repeat it as often, but delivered it with a broad sound and significant look, which nearly took the Welshman off his feet, and brought laughter from all sides of the house. When they met in the greenroom, Williams assailed Quin for rendering him ridiculous in the eyes of the audience. Quin said it was in the ears, and would have laughed off the matter; but the spirit of the Welshman was aroused, and would not brook such treatment, and so he lay in wait for Cato beneath the piazza of Covent Garden. Quin laughed as Williams drew his sword and bade him defend himself, and would have sustained his defence with his cane; but the Welshman thrust so fiercely, that the other was obliged to draw his sword, which, without intention on the part of the wielder, passed through the body of Decius, and stretched him dead upon the pavement.

Coming within our own day is the strange duel related to have been fought by the celebrated tragedian Signor Rossi. The latter, during a farewell performance of *Hamlet* at Casale, was considerably interrupted by the talking of the court society present. In the middle of a sentence, the tragedian stopped, and turning towards a front box from which the greatest noise proceeded, he bowed, and quietly said: 'I shall not proceed so long as you do not hush.' The public applauded; the interruption ceased, and the play went on. But afterwards, Rossi was met at the stage-door by a young gentleman, who felt called upon to ask for satisfaction. The tragedian made rather a long face, for he was expected on the morrow at Milan; so he explained his position to his adversary, and suggested that, in order that the little affair might be settled as speedily as possible, they should go to his (Rossi's) rooms at the hotel and quietly

shoot at one another there. This proposition having been accepted, they went to Rossi's rooms, and had just placed themselves at either end of the *salon*, to exchange three shots, when the inn-keeper, over-anxious as to his guest's health and hours, knocked at the door, which, finding locked, he anxiously inquired if the signor was ill, as his light burned unusually late.

'No,' replied Rossi. 'I am going to bed.—Thanks. Good-night.'

'You are deceiving me,' persisted the inn-keeper, perhaps enlightened as to the scene at the theatre. 'You are certainly ill.'

'Go to bed,' returned Rossi; 'I am putting out the light;' and in a lower tone he added to his antagonist: 'This is the only way out of it—blow out the candles.'

'What! Are we to fight with pistols in the dark?'

'Not quite. We will each smoke a cigarette, and that will serve to guide our aim.'

'All right!'

And so the duel was fought; and Rossi wounded his adversary slightly.

#### UNDREAMT DREAMS.

MIST shadows I have entered through thy door,  
And trod thy corridors, O place of sleep!  
How heavy is thy silence, and how deep!  
How noiseless fall the footsteps on thy floor!  
Thy form is mystic—changing evermore;  
Thy steps are sometimes shallow, sometimes steep,  
And often lead to chambers where dreams keep  
Some sweet surprise, held quietly in store  
To soothe the soul that enters bowed with care  
And life-realities. Yet often there  
We find not what we sought, although we call  
The name with soundless voice; no answer makes  
The wished-for dream—no echo wakes;  
Only the silence deepens—that is all.

ROSE HOWARD.

\* \* In the article 'L. S. D.' in our number for April 9, it was stated that the French centime was not a real coinage, but merely a kind of counter for reckoning small differences in trading. We have since had the coin itself sent us by a correspondent, who says that 'centimes are not only coined largely, but are extensively used by bakers for the purpose of adjusting the price of bread, and may readily be obtained at bakers' shops in Paris.'

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

## WINGED WAR-MESSENGERS.

WITH the exception of the frigid zones, birds of the dove kind, or, as ornithologists prefer to call them, members of the family *Columbide*, are indigenous to every quarter of the globe; and they would appear to have been domesticated at an early date, with the result that their marvellous power of finding their homes from almost incredible distances was soon noticed by the ancients, who saw in them a means of quickly communicating between one district and another, an idea which was speedily put into practice. In all birds the muscles are extremely vigorous; and from the rapidity of the circulation, the high oxygenation of the blood, and the extent to which the lungs are developed, they are capable of sustaining long-continued exertion; and this coupled with the length of wing possessed by pigeons, renders the latter peculiarly adapted for swiftly accomplishing long-distance flights. As instances of their velocity, it may be mentioned that on the 22d of November 1819, thirty-two pigeons, which 'homed' at Antwerp, were liberated from London at seven o'clock in the morning; and the first of these performed the journey—a distance of about two hundred and ten miles—by noon; or, allowing for difference of time, in four hours forty-five minutes—the second bird being a quarter of an hour later; thus giving the speed of travelling at about forty-four and a half miles per hour. In July 1872, a pigeon race from Spalding to London took place, when the distance was covered at the rate of a mile in ninety seconds.

Though pigeons were used as carriers by the ancients, and were by far the swiftest messengers they possessed, advantage does not appear, except in comparatively rare instances, to have been taken of their services for communicating between one district and another during time of war, though that is a period when the speedy transmission of correspondence between one commander and another is of the utmost importance, and when the delay of a message, even for a brief

space, may be the cause of disaster to an entire army. The pigeon was Julius Cæsar's field telegraph; and it was by means of this bird that Hirtius and Brutus corresponded with each other at the siege of Mutina or Modena, 43 B.C. In this capacity, however, it has been but seldom employed, though for what reason it is somewhat difficult to conceive; and consequently, the mounted messenger, the swift-footed courier, and the heliograph and other methods of signalling, were, prior to the invention of railways, balloons, and the telegraph, the only agents made use of for purposes of communication during military operations. Among modern nations, the second of these has been dispensed with, and trust is now chiefly placed in mounted messengers, the railway, and the telegraph as the means of conveying despatches from one point to another during time of war. But these are all liable to break down or to fall into the enemy's hands, and added to which drawback, there is the fact, that during a siege it is impossible to construct a telegraph; and in combined operations between a moving fleet and a coast fortress all three agents become useless. In such cases the heliograph and other modes of signalling are generally resorted to, and in several instances they have been found to be of immense service. But there are certain conditions which sometimes render the establishing of signal-stations a matter of great difficulty, if not impossibility, as, for instance, the presence of the enemy, topographical peculiarities of the country, and atmospheric causes; besides which, there is always the risk that in a war between civilised nations, the communication may be interpreted by the enemy, and so the purpose it was intended to serve be frustrated. The alternative to signalling is the balloon; but though this has in some instances afforded a valuable means of communication, and notably during the late Franco-German war, when it was more extensively used than ever before, its success depends upon such a variety of conditions, atmospheric and other, that its application is confined to very narrow limits.

Notwithstanding the drawbacks named, however, it was not until the siege of Paris in 1870-71 that another method of communicating between an enemy-encircled town and the outer world was practised; for, though pigeon-flying had for long been indulged in as a pastime by certain classes among most nations, no one appears to have conceived the idea of utilising these birds as a means of carrying on correspondence in time of war until the sanguinary struggle which took place sixteen years ago between two of the foremost nations in Europe; and even then it was not until every other method of communication had been cut off save that of balloons, that pigeons were employed as messengers. Balloons could leave Paris daily, if necessary, to carry despatches beyond the Prussian lines, but they could not effect a return; so that, had it not been for pigeons, the inhabitants of the French capital would during the whole of that memorable siege have been utterly ignorant of events transpiring outside their own limited circle. To effect communication, the birds were conveyed from the city in balloons and were forwarded to Tours, at the prefecture of which a large room was converted into a pigeon-loft. The birds selected for the return journey were taken by train from Tours in the early morning to the farthest point north that could be safely reached, and, with missives attached, were then liberated. From November 18, 1870, until January 28, 1871, a pigeon post existed between London and Tours; and during that period, forty-eight day mails and eleven hundred and eighty-six night mails were thus sent. Communications arriving from the first-named city, and the destination of which it was intended should be Paris, were despatched from Tours by winged messengers in the manner described; and thus between the dates named was communication effected between the English and French capitals.

The method of attaching the messages to the birds, a matter which is of great importance, had not been studied before the siege, and consequently at first several pigeons reached their destination without the expected missive attached. As, at the beginning of this system of communication, the paper message was simply rolled up tight, waxed over, and attached to a feather of the bird's tail, its loss was due to various causes—to being pecked by the bearer, to being cut by the thin twine which kept it in its place, and to becoming saturated with wet in consequence of insufficient waxing. To obviate these difficulties, the despatch was subsequently inserted in a small goose-quill, about two inches long, which was then pierced close to its ends with a red-hot bodkin, so as not to split it, and in the holes thus made, waxed silken threads were inserted, to fix it to the strongest feather of the tail.

By the aid of micro-photography, the original messages were copied, greatly reduced in size, upon thin films of collodion, each of which con-

tained on an average two thousand five hundred communications; and as one bird could easily carry a dozen of these films, it was therefore possible to forward thirty thousand communications by one pigeon. Sometimes this number was exceeded, as, for instance, when on one occasion a single bird bore eighteen of these minute pellicles, equal to forty thousand messages. In order to insure arrival, each missive was copied many times, and was sent by several pigeons, some of the despatches being forwarded as many as thirty-nine times, and others as few as three, the average being about twenty. By adopting this plan, though all the birds which were 'tossed' did not reach the capital, a copy of every message sent was received. In this manner one hundred and fifty thousand official and one million private communications were carried into Paris during the four months that the city was in a state of siege. Upon each pigeon-loft from which birds had been furnished for government use, the administration of posts placed a sentry, and when one of the winged messengers arrived, the owner was conducted under escort with his bird to M. Chassinat, Postmaster-general, who detached the missives, which were in due course delivered at their various destinations.

The immense services thus rendered by pigeons to a beleaguered city during the greatest and most memorable siege of modern times did not escape the notice of military authorities of other nations, and soon after the war, almost every continental country commenced the organisation of regular 'Military Pigeon Systems,' all of which are based upon the same guiding considerations. The fortresses on the frontiers of the various countries, and especially those which during the time of war would be most liable to attack by an enemy, together with a large number of both open and fortified inland towns, are provided with pigeon-lofts. Between the fortresses there is often direct communication; but some important point in the interior of the country—generally the capital—is selected as a central station with which all others are to communicate. In instances where the distance separating outlying stations from the central one is considered too great for the pigeons to accomplish with any degree of certainty, connection is insured by means of intermediate ones.

The number of birds at each station varies according to its position, the distances that have to be flown, and the number of directions in which the pigeons have to be trained. At a station where they are only intended to be used in one direction, about two hundred birds are kept; and at those stations which communicate in more than one quarter, something like one hundred and fifty pigeons are maintained for each section or direction after the first. For instance, at a station where birds are trained to fly in three directions, there are five hundred pigeons, which, in case of siege, will be sufficient to insure communication with the outer world for six months, the calculation being arrived at in the following manner. Suppose that correspondence is on an average to take place twice a week, then in six months fifty-two liberations of birds would be necessary, and as the number despatched on each occasion may be taken to average three, the total number of pigeons used

would be one hundred and fifty-six for each direction.

In Germany, which was one of the first nations to establish these military pigeon-lofts, the commandant of the place is held responsible for the birds being properly cared for and trained. A non-commissioned officer is in charge, and under him are two private soldiers and a keeper, the latter of whom receives a salary of four pounds ten shillings per month. A list of the birds is kept in a register, which records their sex, colour, age, distinguishing marks, and other particulars; and another register gives the different places from which the pigeons have accomplished journeys, together with notes on the rapidity and reliability of their flight, and complete information on the capabilities of every bird. So cognisant are the Germans of the important services that can be rendered by pigeons in time of war, that they have gradually established pigeon-station after pigeon-station, until the military pigeon system possessed by them has become by far the most complete and extensive of any in existence. The fortresses of Königsberg, Thorn, and Posen, near the eastern frontier, are all in communication with the capital; and the whole of the northern coast is studded with pigeon-stations, which are under the supervision of the Minister of Marine, and the principal of which are at Danzig, Stettin, Kiel, Tönning, and Wilhelmshafen; whilst the western fortresses of Metz, Strassburg, and Cologne each contain about four hundred trained pigeons, a number which it is proposed to increase to six hundred. A good stock of birds is also kept at Würzburg and Mayence. Cologne, which is in direct communication with Berlin—a fly of three hundred miles—is a transmitting station for Metz, and probably also for Mayence; whilst Strassburg and Metz can both correspond with the capital through Würzburg. It will thus be seen that by means of this network of pigeon-stations all parts of Germany could, in the event of an enemy seizing her telegraphs and railways, still communicate with the capital, and the chief towns on the frontiers could still correspond with each other.

In France, a like system of pigeon-stations has been established, and the military budget annually assigns a credit of one hundred thousand francs (four thousand pounds) for the cost of signalling and maintaining the pigeon-lofts.

But although this system of communication has found such great favour on the continent, our own military authorities have not hitherto entertained the idea, doubtless regarding our seagirt position as being a sufficient protection against an invasion, and there being no necessity, therefore, to give attention to means of communication beyond those we already possess. Such reasoning may to a great extent be correct; but as regards some of our foreign possessions, it certainly does seem as though the establishing of pigeon-stations on the frontiers and coasts would be most useful adjuncts to the means at present available for purposes of correspondence, in case war should at any time unfortunately break out in these regions. It cannot be that the cost of maintaining military pigeon-stations has been the reason why we have not followed the example set by other great continental nations, for that would

be only a mere fraction in a country's annual expenditure; the probable reason is, that the authorities have not hitherto given the subject that amount of attention which it deserves. But that they are at length beginning to see the importance of such a system being established may be inferred from the fact, that in the latter portion of January 1886, Captain H. P. Allatt, of the Royal Military College, Sandhurst, read a paper in London, before a number of military and naval men, in which he advocated the carrying out of a system of pigeon-stations like that which prevails in most great European countries; and the opinion of the majority of those present was in favour of the formation of some government department whose function it should be to train pigeons in the service of England and her possessions. It was also thought that it would be quite possible to train these birds to maintain communication between ship and shore, so that, in case of a combined attack by land and sea forces, those in command could correspond with each other.

Whether or not Captain Allatt's paper is likely to bring about the object sought by its author, it is entirely outside the province of this article to predict; but it is a notable fact that at last year's Easter Volunteer manœuvres at Portsmouth and Dover, pigeons were employed as messengers, and that within the cognisance of the commander-in-chief (the Duke of Cambridge). The idea upon which the operations at both the places named were based was, that invading forces had landed on the southern coast of England, and, being in possession of the country in the vicinity of Portsmouth and Dover, had proceeded to invest these towns; that the telegraph had fallen into the enemy's hands, and that the garrisons were therefore unable to communicate by ordinary means with any other part of the country. A number of pigeons which had been trained by Captain Allatt for the purpose were consequently employed to maintain communication with the supposed besieged seaports. Upon the receipt of the news that the 'invaders' had landed at Whitstable Bay, pigeons were despatched from Dover to Portsmouth, to London, and to Canterbury; and upon the enemy reaching and occupying the latter place in force, a winged messenger was sent to Dover, which was reached in an hour, bearing a communication to the Deputy-assistant Adjutant-general. An hour later, another missive was received, stating that the enemy was advancing on Lydden with a strong force; and the whole of the distant communications it was necessary to make during the 'Battle of Lydden' were conveyed by pigeons. The troops at Dover were thus notified of the approach of the 'invaders,' notwithstanding that telegraphic communication had been cut off, and were able to prepare for the expected attack.

It has been said that it will be a bad day for Old England when she is driven to rely on pigeons to bring her news in time of war; but probably the success which attended the experiments alluded to may have some weight with our military authorities in considering the advisableness of establishing pigeon-stations in Great Britain or her dependencies; for it is beyond doubt that should the day unfortunately come when our present modes of communication, either

in this country or in our possessions across the seas, fall into the hands of an enemy, much valuable service might be rendered by an organised military pigeon system.

## RICHARD CABLE, THE LIGHTSHIPMAN.

BY THE AUTHOR OF 'MEHALAH,' 'JOHN HERRING,'  
'COURT ROYAL,' ETC.

### CHAPTER XXIII.—HOME?

'We dine at half-past seven. The rector and Mrs Sellwood are coming. They have that French Countess staying with them.'

'Very well, papa.—Are those dreadful nien gone?'

'Hark! They are giving you three cheers. They will have to carry Jonas Flinders away in a wheelbarrow. He was tipsy when he came. He's a relation of Richard's, is he not?'

'No, papa,' said Josephine, colouring. 'Richard has no relations here.'

'I am glad of that. I made a mistake. He is a kinsman of the first Mrs Cable—brother, if I am not misinformed, of the deceased Polly.—I am glad the tie is no more than that. It would have been awkward to have a drunken brother-in-law, or something of that sort, demanding his entrée. Even as it is, I foresee some awkwardness—he will come to visit Richard, if he does not force his presence on you. It will be as well to let him understand always to go round to the back when he calls.'

An hour passed before Richard Cable came to the Hall. He hesitated about entering by the front—and without ringing. He suddenly felt that he was in an awkward position. His wife was Squires of Hanford, lady of the manor; the mansion belonged to her, and he—he would not be master in the house, and in that great house would probably feel uncomfortable. Home to him was a cottage with a big back garden, and a vine running over the low roof, a kitchen in which the meals were not only cooked but also consumed, and a little bedroom with the stairs opening into it; and a lean-to roof where all the rafters showed. He stood in the porch, put his hand before his mouth, and coughed. The glass window was open, and he looked into the hall; it had a polished oak floor inlaid in patterns. There was a billiard table in it. There were carved cabinets, with yellow and blue Japanese vases on them, and crimson cloth curtains before the staircase which opened out of the hall. Mr Cable ventured a little way within and coughed again. Then, frightened at his own voice, he retreated into the porch, and examined the white jessamine that trailed up it. If he were to go in—he would not know his way about the house. It seemed too absurd to ring the bell, and hardly proper for him to go round to the kitchen.

Richard Cable was a shy man when out of his proper element and among those he did not know intimately. Brave at sea and in any peril, he was timid on land when placed in situations with which he was unacquainted. He was a humble man, with much self-diffidence, and only strong when he thought he was doing his duty.

As he stood in the door, duty was neither before him nor behind him, on this side, nor on that; and he was perplexed. He put his nose to the jessamine, and thrust his hands into his pockets. He knitted his brows and considered. Now he wished he had come along with Josephine directly after landing; then he could have entered the house at her side and taken his proper place; but the strong hunger in his heart to see and clasp the dear golden heads had carried him away, and he had missed his proper opportunity.

Something must be done, he said, and drew his nose away from the jessamine. He pulled his right hand out of his pocket, took off his glazed hat, and walked boldly into the hall, where he began to hum a tune, as he hung up his hat on the peg near the door. He sniffed up a pleasant odour. It is a remarkable phenomenon that the smell of dinner invariably goes where it is not wanted, and where it ought not to be. It is not smelt in the kitchen, where it is cooked; but it travels into the bedrooms; it pervades the staircases; it penetrates to the drawing-room; and it meets those who are about to partake of the dinner, at the entrance of the house. Architects rack their brains, engineers scheme, to circumvent the smell of dinner—all in vain. It will not be circumvented. It has been known to come out of the house by the kitchen chimney, scramble down the roof, and take up a position, from which nothing can drive it away, a quarter of a mile off at the lodge-gates. Now, if it were only the vanilla flavouring of the blanc-mange, or the cinnamon for the stewed pears, or the ratafia for the trifle, that thus announced itself, no one would object; but these delicate essences are elbowed away and down-trodden by the coarser savours of boiled cabbage and cauliflower. Woe betide the householder if he keeps pigs, and his factotum induces him to boil potatoes for the sty. The smell of those potatoes becomes a thick reek in every portion of his house; and by that perversity which orders the events of life, the pig potatoes are certain to be boiling when distinguished, even titled, visitors call on us, and sends them away after a curtailed call, impressed with the belief that our sewers are out of order.

Richard Cable was hungry; and the smell that saluted his nose was grateful. He thought at once, with a softening of the heart, that Josephine had considered him, and was doing a chop or a rasher for him. His mother had desired to detain him, and had promised him supper; but he would not stay with her, because he thought his duty called him to the side of Josephine. As he was venturing hesitatingly across the hall, he heard a door slam, heard a step, and at once retreated to the porch, but not before the butler had caught sight of him, and came after him, with a: 'Now, then! What are you doing here? Trying to carry off a greatcoat, eh? One of them drunken rascals as have been in the kitchen, I'll be bound.'

'I beg your pardon,' said Richard, standing still, and becoming red as fire; 'I'm—I'm the husband of Miss Josephine, sir. That is—sir, I'm Mr Richard Cable.'

'I'm very sorry, sir, very sorry,' said the butler, his face altering immediately. 'I did not see

at first; I thought it was an intruder, and I wasn't sure what he might be up to.—O sir, here come the rector and the ladies.'

The door was darkened by the arrival of the guests.

'There's dinner, sir, immediate, if you'd run up-stairs and dress. I'll tell cook to put back for ten minutes.'

'Dress!' exclaimed Richard, startled, and casting a hasty glance about himself to see if by accident any portion of his garments had not been put on.

'Up-stairs, right-hand side of passage, first door, is your dressing-room, sir,' said the butler, covering him from the visitors.

'But I don't want a dressing-room, sir!' remonstrated Richard. 'I'm in my togs.'

'What! Cable!' called the rector, coming forward. 'Did not expect you here. Did not know that you had returned; wish you joy and happiness. But—I see, just off the water, and I am detaining you from dressing.'

Richard ascended the stairs in a puzzled state of mind, and walked on the side, not in the middle, lest he should dirty the pretty red carpet that ran down the stairs. When he came to the top, he looked about him. 'First door on right hand,' he said, and went to one, but was doubtful whether it were the right door, for the butler had said something about a passage. He saw no passage. He stood hesitatingly at the door and coughed. Then he put his hand on the handle, but doubted whether he ought to open, fearing this might be the wrong room, so he coughed again and tapped faintly at the door. Instantly it flew open, and Josephine appeared in white satin with lace and orange flowers, and a few pearl-gray silk bows, as a compliment to the memory of Cousin Gabriel, as an acknowledgment that she was in mourning. She looked very lovely in her evening dress; it was her bridal dress made into one for the evening.

'Good gracious, Richard! you're not dressed!'

she exclaimed, and stepped back. 'Not dressed!' he said with a stupid stare. 'You're the third person who has said this, and yet—I—I can't believe it. I know I am in my togs.'

'O Richard! how late you are. Be quick—you will keep every one waiting. Do dress.'

'Dress!' he exclaimed, becoming desperate. 'What more will you have? Shall I put on my greatcoat?'

'Good gracious!' said Josephine, putting her hand to her chin, 'I don't believe you have got any clothes!'

'Feel me,' said Richard, 'if you cannot believe your eyes. I've got my suit on.'

'But not your dress suit. Goodness! what is to be done! I never thought about a set of evening clothes for you. I really supposed you might have provided all that for yourself.'

'I've got the frockcoat in which I was married,' said Cable, 'and the lavender thing-um-jigs, and a yellow nankeen waistcoat. What more do you want?'

'Get into that,' said Josephine hastily; 'there is no help for it. I really must go down. The rector and Mrs Sellwood have come.'

About ten minutes later, Richard Cable was heard coughing outside the drawing-room door.

He was shy of entering, and stuck there hesitating, hearing the voices within, till the butler came to his aid and precipitated him into the room. Then he stood bewildered, looking vacantly about him, till the rector came to his aid and conveyed him into the middle of the apartment.

Josephine looked keenly at him, and almost wished he had come in his dark-blue sailor suit, which became him, instead of cutting the preposterous figure he did. In his nautical dress, he looked so handsome, such a frank, manly fellow, so every inch one of nature's gentlemen; but now—in the black frockcoat and lavender trousers, uncomfortable, shy, ungainly—and—O horror of horrors! without having changed his shirt, with the old coarse linen collars and front, clean but crumpled—and—and— Josephine was in the midst of a conversation in French with the Countess de Marluche, whom the Sellwoods had brought with them, when she lost the thread, forgot what she was saying, forgot the subject about which she was conversing, in her consternation at the figure her husband cut among well-dressed ladies and gentlemen.

'Dinner is served,' said the butler.

She recovered herself at once, and said to the countess: 'We are just off the water. Our yacht only arrived a few hours ago, and we have to ask your indulgence if we appear in picnic guise.'

Then she saw Aunt Judith looking at her, and the rector came over towards her. She was startled. She had forgotten that she, not her aunt, was the lady of the house. Her father turned to Richard Cable, and said: 'It is your place, Mr Cable, to take in the Countess—will you lead the way?'

Josephine cast an appealing look at her father; but he took no notice of it.

Richard was obliged to give his arm to the French lady and lead the way. He was followed by Mr Cornelis with Mrs Sellwood; then came Captain Sellwood and Aunt Judith; lastly, the rector and the bride.

Captain Sellwood maintained an imperturbable face. He would not have come, had he known that Josephine had returned. Mr Cornelis had begged him to make one of the quiet dinner that evening, quite a family party, no strangers. In the little society of Hanford, scarce a week passed without a small dinner of this sort, cosy little repasts, where old friends met again and again at each other's houses. As the Cornelis family were in mourning, recent mourning, of course they gave no parties; but these small unceremonious dinners did not count.

When Richard, with the French lady on his arm, arrived in the hall, he stood still, put his hand to his mouth and coughed. 'I declare,' he said, 'I don't know the bearings.'

'This way, sir,' explained the obsequious butler, bowing at the dining-room door. Then: 'Excuse me, sir; you're at the wrong end of the table—up the room, sir.'

'We shall get right at last, ma'am,' said Richard to his companion. 'I hope you're as ready as I am to play a good knife and fork.'

'Mais! malheureusement! monsieur, je ne parle que fort peu l'Anglais.'

A roast goose was in front of Richard. He

stood up to carve it, and turned back his cuffs. 'I daresay the old lady is hungry,' he said to himself in his kindly thoughts. 'I'm sure in her foreign country she don't get such solid food as in England. We didn't, I know;' so he helped her to the leg of the goose.

'Mais, monsieur, je vous prie!—c'est un peu trop!'

'Too much?' So he sliced the leg in half, and served her the drumstick.

'There's stuffing, sir,' said the butler confidently in his ear.

'Is there, sir?' answered Richard. 'And how am I to get at it? It is not often we've had a chance of carving a goose, I can tell you.'

Josephine looked on in terror, lest he should splash the gravy about the table, possibly over the Countess; but Richard had a hand at once too firm and gentle for that. Though he had no great experience in carving, he managed fairly well, only that he gave enormous helpings to every one, generous helpings, because he wished all to have enough, and he measured all appetites by his own.

He made a few attempts at conversation with the countess, but could not succeed; her knowledge of English was rudimentary, his knowledge of French was *nil*.

Josephine was fortunately saved the effort of making conversation at her end of the table, because she sat by the rector, who could and did talk whenever he had a chance. She was at leisure, whilst half listening to his voice, to watch her husband's face. It wore its usual kind and honest expression, but it was troubled. He was uncomfortable, willing to do his best, desirous to do his duty, but ignorant as to what he ought to do, and bewildered by the strangeness of the situation in which he found himself.

Even whilst speaking to the rector, Josephine's eyes became dim with a mixed emotion—vexation that Richard should cut such an absurd figure, and pity for him, because she knew he was suffering. Then she felt her brow become warm, for the great solemn eyes of the captain—after having rested on Richard for a moment whilst he finished his gravy with his knife, putting it into his mouth—turned and looked at Josephine, and at once dropped.

'Dick will need some taking in hand,' thought Josephine; 'he is better at sea than on land.'

If Richard Cable had been a bumptious man, one with much self-assurance, he would have talked and joked and drunk his wine and felt quite at his ease, and gone to bed believing that he had made a good impression on the company; but Richard was a modest man, always mistrustful of himself where he did not see his way, very sensitive, and somewhat alive to the ridiculous. He was, though he did not know it, so thoroughly a gentleman at heart, that he shrank from intruding where he was unqualified to take his place. Now, in society, into which he was cast headlong, at a dinner, of a sort with which he was quite unfamiliar, dressed differently from the other gentlemen, and knowing that he did not look well in his clothes, he was troubled and frightened, and only partly recovered himself when the ladies had left the room, and the rector took his glass and came over to the

end by Cable, as he did not attempt to come to the rector's end. The rector was a man of the world, and could get on with any one. He at once began to speak about the cruise in the yacht, and having got Richard on a familiar subject, with great forbearance encouraged Cable to talk, instead of doing all the talking himself.

When Cable spoke of anything that he understood he spoke well, straightforwardly and intelligently. The rector kept him in the dining-room a long time. He was interested in the cruise of the *Josephine*. Perhaps he saw that it was a kindness to keep his host there, conversing on what he could talk about, instead of bringing him into the drawing-room and the society of the ladies.

'Shall we rejoin the ladies?' asked Mr Cornellis.

'No hurry, Cornellis,' answered the rector.—'What capital port this is; I'll have another glass. Mrs Sellwood must be allowed her nap.'

When, about eleven o'clock, the guests were gone, and Mr Cornellis and Aunt Judith had retired, then, for the first time since they had landed, Josephine and Richard were alone together. She closed the piano and blew out some of the candles and turned down the lamp. Richard was standing at the chimney-piece with one hand on the marble mantel-shelf, looking at the French ormolu clock. His head was slightly bent; he was immersed in thought, just as many a time he had stood at night resting his hand on the bulwarks of his lightship in a dream.

'What is it, Richard?' asked Josephine, going up to him.

'I was thinking—it is half-past eleven—of the little bedroom at home where mother and all my children are now asleep, and the angels watch them.'

'Home,' said Josephine reproachfully. 'This now is your home. Is it not beautiful?'

'This—home!' He looked round with dazed eyes. 'Home?'

'Of course, Richard.'

'Home?' He shook his head. 'If I was dead and gone to another world, I reckon at first I should feel a bit muddled. In time, maybe, it will come—not all at once.' And as he went up-stairs, he wondered in his heart whether he could ever come to feel there—in that grand house, among those strange people—at home.

### THE CATTLEMAN OF THE ATLANTIC.

THE eye of the landsman sees little in the personal appearance of the seaman giving indication of the taste for cleanliness which is habitual to him. His attire is often of a composite and inharmonious character, and his tarry hands and weather-beaten face are little amenable to the beautifying influences of soap and water. But let the fastidious landsman change places with Jack for a week or so on board ship, and it will be seen which of the two has the more practical reverence for the sanctity of cleanliness. It is rarely the privilege of a passenger on an ocean-going steamer to obtain a glimpse of the sailor's domestic arrangements in the fore-castle; but if he does succeed in enjoying even a momentary inspection of that compartment—where Jack

sleeps, dresses, eats, mends—he cannot fail of being struck by its cleanliness. Very different is the fore-castle of the firemen, and still more different that of the half-nautical class about to be described; and it is cleanliness for its own sake, too, for the sailor resents in the strongest manner any curious observation of his 'fo'c'sle' by other eyes than his own. The ship's officers never look in there, knowing and respecting Jack's objections; and the landsman on board who feels moved by a curiosity to see how the sailor lives in his privacy, had better keep away from the fore-castle, unless responsibly introduced.

The mariner's partiality for cleanliness in regard to his immediate personal surroundings extends to his ship as well, and he likes to see well-cleaned decks as much as the passenger likes to walk upon them. Of course, Jack is—more often than not—under the necessity of signing articles on a cargo-ship, where the cleanliness and 'ship-shapedness' of things generally are not considerations. He has less trouble, as a consequence, but he serves under silent protest. Atlantic steamers do not carry coals, to be sure; but many of them carry cattle and sheep, a description of cargo which the sailor detests in a degree only less than that in which he detests the men who go in charge of the animals. The 'stowaway' is to Jack an unmitigated nuisance, although he will share his own rations with the hiding wretch as long as is necessary, rather than see him hungry; but the cattleman is his abomination, and that of every one on board from the captain downward. Perhaps a little information regarding this particular product of the Atlantic trade—the 'bull-pusher,' as the sailor terms him—will have some interest for the general reader.

The ocean traffic in livestock is quite a recent development of trade, and is carried on most actively during the months of summer and autumn from the Canadian and United States ports. The cattle shipped to England are of two classes—'distillery' or house-fed cattle, and those fed on grass; the one being easily distinguishable from the other by certain indications of the eye chiefly. Cattle landing in British ports from the United States are, under the Privy-council Regulations, compulsorily slaughtered on the spot; those coming from Canada are exempted from this ordinance, and are taken to the public market for sale. The shipping of cattle to a great extent is a speculative business, carried on with varying luck; and perhaps in the end the only balance of profit arising from it is that of the steamship owners. It is claimed for it that it cheapens beef and mutton to the British consumer; and so it obviously ought to do, considering the low price at which Canadian and American meat can be landed in England. But the consumer himself, when the theory is propounded for his gratification, is prone to regard it as a delusion; seeing that, as a matter of fact, it has not reduced the price of butcher-meat at home. Into the political economy of this question, however, we are not called upon to enter.

The shipping of livestock is, during the summer and autumn months—almost as long as the navigation of the St Lawrence is open—the principal

trade of Montreal. As many as ten and twelve steamers laden to their full capacity with cattle and sheep may sometimes be seen leaving that port in one week. Some steamers load three decks, the sheep being always carried in pens on the upper deck. It is a remarkable fact that large numbers of the sheep become blind during the ten or twelve days' voyage, a malady which is attributed to the condensed water supplied to them for drinking, and the heat from the engine-room and funnel. There is also more mortality among sheep than among cattle, the latter as a rule suffering little except in rough weather. An interesting fact noticeable on cattle-boats is that, from one to two days before sighting land, the poor animals, by some mysterious instinct, seem to know that the sad ocean voyage is near its close, and that green fields and fresh streams are not far away. They low almost incessantly day and night. For a day or so before landing them, the men give the cattle hardly any water, so that on being turned ashore the parched beasts may be suffering from a raging thirst, the greedy gratification of which at the troughs will swell them to respectable proportions for the eye of the market.

Point St Charles, in the outskirts of the city of Montreal, not far from the Victoria Tubular Bridge which carries the Grand Trunk Railway across the wide St Lawrence, is the great entrepot of the Canadian cattle-trade. Blinding with road-dust, coal-dust, and factory smoke, a more uncomfortable spot on a hot summer day could hardly be found in the British empire. Here are situated the cattle-yards, where the cattle are unshipped from the railway cars and collected for transfer to the steamships down at the city wharfs. And here the curious observer can behold at any time of day during the shipping season a crowd of cattlemen waiting the chance of a job. When a shipper has his consignment ready for shipment, he has at his hand at the 'yards' any number of candidates for the duty of attending to the cattle on the voyage. Some of these are emigrants sick of that side of the world, and glad to obtain the chance of working their passage back to England without other remuneration. On these terms, they have no difficulty in obtaining what they want; and this class of men are more odious to the professional cattleman than the lazy and awkward stowaway is to the sailor—for a stronger reason. The cheap competition of the greenhorn tends to lower the rate of pay, for the shipper will naturally give the preference to the man who costs him nothing—it being part of the steamship's contract to carry over and back again the men required to look after the cattle—and a batch of greenhorns with the leavening of one or two experienced hands serves the purpose as well as (generally better than) a force of all 'old hands'; for these 'old hands,' whom you may see hanging about the cattle-yards at Point St Charles, easily identifiable by patent evidences of rascality in gait, feature, language, and attire, are, to the least experienced eye, undoubted specimens of that genus of mankind significantly termed in America 'hard' characters. The 'old hands' will not work without wages; but, as has been said, the competition of cheap labour has beaten down their trade, and now

they have to be content with the average remuneration of two or three pounds for the trip, instead of three times the amount, formerly paid. This payment completes the contract on the part of the shipper; and the steamship Companies are bound to provide the men with return passages to the port from which the cattle are shipped. The cattlemen—who are engaged in the proportion of about one man to forty beasts—are accommodated on board in a separate fore-castle, which successive gangs of them render unspeakably dirty. They are allowed the same food as the seamen and stokers. From the first day of going on board, the cattlemen are a public nuisance to the ship. The steward and cook are the objects of their special hostility. Those men, who never worked when ashore, have probably had a prolonged course of starvation before embarking; and the first gluttonous cravings of hunger partially appeased, the food, which at first was grateful to their famished appetites, is reviled in the choicest terms of a copious and forcible vocabulary. What is good enough for the sailors is not nearly good enough for them. Their work affords them a good deal of leisure, and this they mainly devote to begging and thieving in the neighbourhood of the galley. The cattlemen are not, unfortunately, amenable to discipline, as the crew are, and they do not fail to stretch this impunity to the farthest limit. They do their work, because they must; they are supervised by a foreman, whose unfavourable report of any man to the agent at Liverpool, Glasgow, Bristol, or London, as the case may be, would have the unflinching effect of reducing or altogether confiscating the delinquent's pay. But the foreman has no interest in the men's conduct beyond the due feeding and watering of the cattle. The rest of his time, the average cattleman, who is an 'old hand,' and familiar with all practicable rascalities on board ship, devotes to the work of making himself a nuisance. It is an hour of relief to the ship's company when at last the cattle are put ashore and the cattlemen along with them; and Jack, observing the 'bull-pusher's' exit from the fore-castle with a thoughtful grin, amuses his fancy with the familiar picture of the despicable mendicancy which the same rowdy individual will by-and-by present when once more landed at Montreal after his trip.

Those men who have contracted for payment immediately accompany the foreman to the office of the agent to whom the cattle have been consigned. The shipper has sent by mail a letter of instructions specifying the amount payable to each man. There are some shippers who defraud the wretches of their hardly earned money by sending no authority to the agent to pay them; and the scoundrel who consigns the men to a week or ten days of starvation and open-air lodging while they are waiting the return sailing of the steamer, is constituted of no finer moral fibre than the victims of his petty knavery. The great majority of shippers, however, fulfil their contracts honourably, and as soon as the men present themselves to the agent, they are paid. Then forthwith is commenced a great 'drunk.' The cattleman never for one moment dreams of extending his acquaintance beyond the congenial purlieus of the docks

in Liverpool or of the public-houses around the cattle-market at Islington. In both places, his money is spent in one or two days. Then want succeeds with enforced and miserable sobriety. If he has not paid in advance for his bed and board—which he seldom thinks of doing—he sleeps where he can by night, and sponges on whom he can by day; and at last, on the day of sailing, presents himself once more on the steamer hungry and sullen, without so much as the luxury of a pipe of tobacco to soothe his wretchedness until he has an opportunity of begging or stealing it.

Nothing cheers the cattleman on his return trip so much as to see emigrants on board. To these simple and confiding people he immediately devotes himself with his best manners and most interesting information concerning the new country to which they are adventuring; and the easily moved good-nature of the emigrant becomes as convenient to the insinuating cattleman as his trustfulness is profitable. If the fellow could only restrain his instincts within bounds of prudence, he might live well among his friends the passengers, enjoying their society and their hospitality all the way across; but when the inevitable thieving commences, the authorities of the ship interfere, and he is driven forward to the fore-castle, and prohibited from trespassing aft beyond a certain sharply marked line, which the boatswain keeps his eye upon. Thus the cattleman undoes himself; and mostly in bed, or lying about the deck in moody idleness, he whiles away his time between meals until he is once more 'dumped' ashore at Montreal as impecunious as when he started.

He has, generally speaking, not one penny when he lands, unless he has pilfered something on the voyage; but Montreal is 'freer' than London or Liverpool, and he can sleep about at night without fear of interference from the police. Then, besides, there is a peculiar and popular hostelry on the wharf known as Joe Beef's Canteen, where, for a nominal sum—or, in the case of a particularly 'hard'-looking rogue, for no sum at all—the spirited proprietor dispenses solid and liquid refreshment to the indigent. For the sum of five cents (twopence-halfpenny) a very fair 'feed' can be purchased, or a 'square drink' of any spirituous liquor measured out with free liberality. Joe Beef's Canteen, from one point of view, is worth going to Montreal to see and study. For dirt, stench, drunkenness, vileness unspeakable, human wretchedness and human rascality, it is a sight and a rendezvous not to be matched, or indeed approached, in any other town or city in the civilised world. To the police it is invaluable as a medium for the detection of criminals, and hence to some extent its *raison d'être*; to the penniless cattleman or sailor or tramp, and to every approved specimen of broken-down rogue and vagabond, it opens a refuge which is deeply appreciated and extensively used.

The winter is a long and severe one across the Atlantic, and the question will naturally arise: How does the cattleman get through it? As nearly as we can estimate, from a tolerably intimate knowledge, seventy per cent. are natural rogues and vagabonds, the other thirty of a somewhat higher social instinct. The latter will

probably obtain employment of some kind to carry them on until the next shipping season; the former will almost certainly spend the interval in prison, issuing forth refreshed in good time for the summer trade.

## BLOOD-MONEY.

BY CHARLES GIBBON.

IN FOUR CHAPTERS.

CHAP. I.—THE TEMPTATION.

NED ALTCARR sat late at night in the scantily furnished room of his cottage. The fire burned low, for coals were precious. A candle glimmered feebly in the gloom, and sputtered as the high wind whistled through the worn framework of the window. Signs of poverty appeared in everything, and he, with hands clasping his brow, was fain to face with absolute want. A clerk out of work for two months, with a sick mother and a young sister to support. He had done his best, and now the last crust had been eaten. Even that crust had been supplied by charity. The workhouse was the next step in the downward career—the workhouse or—

He started to his feet—there was some one cautiously tapping at the window, and calling in a shrill whisper: ‘Ned, Ned—open, and let me in.’

He went to the door; and a man, with the collar of a heavy overcoat drawn up over the lower part of his face, and a cap worn low over his brows, pushed his way in, closing the door quickly behind him.

‘What’s up, Jack? Is anybody chasing you?’

Jack was excited and out of breath; but presently he answered huskily: ‘I don’t know; I am not sure. But I want to stay here until to-morrow night.’

‘Here! Why, man, this is the first place the police searched for you. They have learned that we are old friends, and they have set a watch upon me.’

‘If they came here first, they are less likely to come again soon. Anyhow, I am too tired to go farther. You must hide me for a few hours, for old times’ sake.’

‘What madness tempted you to come back?’

‘I doubled on the hounds, and hope they are thrown off the scent.—Give me something to drink.’

Ned pointed to a broken jug containing water, and the visitor took a thirsty draught.

‘Have you nothing stronger?—anything eatable?’ he queried in his hurried way; and when his friend, with a gloomy shake of the head, signified no, he added: ‘Is it so bad as that, lad?—And the mother ill too.—Here, take this: you can go out and get something—get some brandy. I want a fillip and a bite, for I have not dared to venture into a house since yesterday.’ He placed a handful of silver and copper on the table.

Ned hesitated, and at that moment he heard his sister calling him. Fearing that the girl might come and discover the fugitive, he hastened to his mother’s bedroom.

‘Mother is worse, Ned; she can scarcely breathe,’ said his sister, crying.

Ned looked for an instant at the invalid, raised her in his arms so that she might cough more freely, and gently laid her down again. ‘Don’t leave her for an instant, Kitty; I’ll be back soon.’ He returned to his own room, and snatched up the money which was on the table. ‘Bolt the door after me, Jack; I won’t be long.’

During his absence, Jack Wolton tried to rest. He threw back his cap, opened the heavy overcoat, and lay down on the little bed in the corner. But he could not lie still. Springing up with a muttered oath, which was in truth a groan of anguish, he moved restlessly about the confined space, his hands clenched, and his lips tightly closed, whilst his bloodshot eyes glared fiercely at the shadows which the flickering candle revealed around him.

He was a tall, stalwart fellow, and had been handsome; but the face was now pale and haggard. He had been fond of athletic sports; and even when he rose to the position of assistant-manager in the great cloth manufacturing firm of Arnold & Co., Leeds, he continued to be a leading spirit amongst cricketers and football players, so that his muscular powers were unimpaired by his close confinement to a desk. He was regarded as one of Fortune’s favourites: frank and sociable; steady in business, and enjoying the entire confidence of the house he served. It was understood that he was to marry a pretty girl, Lizzie Holroyd, the daughter of Arnold & Co.’s cashier; and there seemed to be every prospect of happiness and prosperity for the couple.

Suddenly, there was a change in Jack Wolton’s manner and conduct, which astounded everybody. He became morose, abstracted, and forgetful to such an extent, that the firm, under the advice of an experienced physician, insisted that he should take a three months’ holiday, as it was evident that he had, in his eagerness to ‘get on,’ overworked himself to the verge of a total breakdown.

He submitted; but instead of going abroad, as he had been advised, his time was spent at Blackpool, Harrogate, and Scarborough—flying from one place to the other without finding satisfaction, and constantly appearing in Leeds at the most unexpected times. On returning to his post, he was subdued in manner, pertinacious in his attention to duty, but the old blithe spirit was gone. Meanwhile, it became known that his engagement with Lizzie Holroyd was at an end. Why and how, could only have been explained by the lovers, and they were silent.

Towards the end of a year, Jack appeared to be regaining a degree of his former healthy good-humour. Then it was rumoured that Percy Arnold, the eldest son of the head of the firm, was about to marry the daughter of a Manchester merchant-prince. When Jack was told this, he said decisively to his informant: ‘It’s a lie.’ But when he read a paragraph in a local newspaper referring to the forthcoming event, he walked into the private room of Mr Arnold, senior, with the paper in his hand. ‘Is this true?’ he asked, pointing to the paragraph.

‘Of course it is,’ was the answer; ‘and a capital match too. Why do you ask?’

‘If it is true, your son is the biggest black-guard that lives.’

Old Mr Arnold was dumb-stricken, and convinced

that the man was mad. At length he gasped: 'What do you mean, sir? How dare you!'

'Don't talk about daring to me, Mr Arnold. I am sorry for you; but for your son, I hope he and I may never meet. If we do, it will be bad for one of us. He is bound to Lizzie Holroyd.'

Jack left the place, and was not seen again by any one connected with the establishment, except Ned Altcar, who, for holding intercourse with him, was promptly dismissed—at the instigation, it was believed, of Percy Arnold. The latter was a gentleman who found little favour amongst the people connected with his father's business, and he was perfectly indifferent whether he did or not. But a thrill of horror and pity did pass through the breasts of every one when it was reported that the young man had been found dead near Kirkstall Abbey—evidently murdered. The words which Jack Wolton had spoken to the dead man's father clearly indicated the criminal, and the hue and cry was raised against him; but so far he had eluded all efforts to capture him, even when they were stimulated by a government offer of one hundred pounds reward.

When Ned went out to procure the refreshments of which the fugitive stood so much in need, he learned that Mr Arnold, senior, had added five hundred pounds to the reward already offered for the capture of his son's murderer. He was extremely nervous as he placed the things on the table; and Wolton, observing how his hands trembled, told him to follow his example and take a stiff glass of brandy-and-water.

'I'll take some in to mother, first, Jack. She's very weak, and maybe this will help her. The doctor said she ought to have a little.'

Wolton nodded, and helped himself again. Then he made an attempt to eat, but could not. He tried hard, knowing of how much importance it was to him to eat rather than to drink. But he could not swallow, and he drank again.

Ned having attended to the invalid, sat down, and he, too, found some difficulty in eating. A horrible idea had possession of him—a temptation of the evil one, which he tried to find strength to conquer by drinking. The brandy acting upon his empty stomach would have had a disastrous effect; but he was careful. Wolton was not.

'Why do you keep on shivering in that way?' said the latter.

'I am frightened,' was the dull answer.

'Frightened at what?' asked Wolton recklessly.

'Frightened at myself,' rejoined Ned gloomily, with elbows resting on his knees and chin on his knuckles, whilst he stared into the embers.

'You are frightened because I am here. Well, I am sorry to bother you. But mind, Ned, whatever happens to me, what I have done was a just act of retribution.'

'No doubt, no doubt it was so in your eyes. But—'

'Oh, stop your "buts." You know, if no one else does, how much I had to bear when the girl, who was on the point of becoming my wife, told me that she liked *him* better than me. You know how hard it was for me to say: "Very well, Lizzie; if you believe that you will be happier

with Percy Arnold than with me, I shall not stand in your way." But I did it. I spoke no word of the bitterness I felt at the notion that if my fortune had been equal to his, she would not have changed. I tried to think only of what was best for her—or, at anyrate, of what pleased her best, for I never believed that he would be true to her.'

'You did the right thing by her, Jack. Nobody will gainsay that, and she was a fool not to see.'

'Drop that, Ned. I can't bear a word against her. She has found out her mistake, and is suffering for it. If he had been faithful to her, I would have got over my loss in time. But when I learned that he had left her with her baby, and was going to marry another woman, my head went wrong. I believed that they had been married—they both said so, and she believed it—poor lass.'

'He was always equal to any lie that served his purpose,' muttered Ned abstractedly, for he was tortured by that horrible idea which was flickering like a fiery speck in his brain, and unable to follow the passionate self-defence of his companion.

'Even then I held myself in. I sent for him, and told him that he must do the right thing by the girl. He laughed at me, and said she knew what she was about, and that he would see to the kid.—Think of that, Ned—think of that! I struck him, and he fell. I did not mean to kill him; but he deserved it. Such a demon had no right to live further. And yet the law would hang me for ridding the earth of such a pest.'

'Hush! Don't talk so loud. I tell you the place is watched, and you may be heard.'

'All right, old fellow. I don't want to bring you into trouble; but I do want you to understand that my act was that of an honest man.—Ah, Ned, I cared more for that girl than for—well, for my own soul. That's true.' He rose, and again moved restlessly about the room.

Ned did not look at him or speak, but was conscious of his every movement.

Presently, Wolton flung himself on the bed. 'I'll try to get a nap,' he said hoarsely, 'and that will help me on my next journey. I'll get off safe enough. Turn me out, if you are afraid to let me rest here.'

'Rubbish.—Take a rest if you can get it. I'll keep watch, and waken you, should there be any signs of danger.'

'That's like you, Ned. Thank you. I think there is a chance of sleep to-night.' His eyes closed drowsily, and presently his heavy breathing indicated that he was asleep; but his nervous movements and occasional mutterings proved that the sleep was much disturbed.

Ned glanced now and again at the recumbent form, and then back to the smouldering fire, in which he saw the big words, 'SIX HUNDRED POUNDS!'

There was a sudden hush of the wind, which had been blowing in sharp gusts, making eerie noises through the crannies of the cottage and in the chimney. The stillness was broken only by the stertorous breathing of the fugitive, who, after days and nights of restless wandering, had at length found a haven in which he might resign himself to repose in the confidence that a friend was keeping watch over him.

Ned remained in his position, his eyes hungrily watching those potent words, whilst he shuddered at the suggestion they conveyed. The lull outside startled him, and his fingers twitched convulsively. He wished the wind would rise again, and help to drown the sounds which would not allow him for a moment to forget the presence of his friend. He dug his knuckles into his temples and tried to think of other things—tried to work out a plan by which Wolton might be enabled to escape—tried to look his own future in the face and to guess what the end was to be. But that was plain enough, was his bitter thought—the workhouse or starvation, or—the other thing. Yet, six hundred pounds were written in letters of fire on the white ashes in the grate. He shut his eyes, and still he saw them as if they were burning on his eyelids. He altered his position, and they took shape out of the shadows which the feeble candle cast around him. Then voices seemed to hum the words in his ears: 'Mother ill; you, a beggar, and six hundred pounds at your command! Six hundred pounds!—one from government; five from old Arnold.'

With such a sum, what might not a man do? There was comfort assured for the mother, relief for his starving sister, and a fortune in the future for them all. And to secure this what had he to do? Only to say: 'There is your man.' He shivered again, and felt sick. In wild horror, he seized the brandy bottle, and sought to deaden the torment of thought and speculation. Yes, he had only to speak these few words, and the misery of poverty would disappear. But what besides? He would be a traitor to his friend, who had trusted his life to him! At the same time, what could life be worth to a murderer? He could know no happiness in it. The memory of his victim must haunt and torture him till he committed suicide or gave himself up to the authorities. That was supposing he escaped; and what likelihood was there of that? Would there not be countless eyes eagerly on the lookout for the wretched man, whose capture meant six hundred pounds to the lucky one who was able to say: 'There is your man.'

The moral sense of the poor clerk was being rapidly poisoned. There could be no wrong in it. Was it not a duty to aid the ends of justice? Was it not a crime to help a murderer to escape the penalty of his crime? Why should others have the reward, which he might obtain and use with advantage for innocent sufferers? It would save the man a few days, maybe a few weeks of agony; for he could experience nothing but agony whilst he was being hunted from place to place like a beast of prey, weighed down to the earth by the sense of his guilt. He could not escape. Why, then, should Ned Altcarr lose the opportunity which had been thrust upon him—ay, thrust upon him, he must remember that—of finding a way out of direst misery? And yet the thought was a horrible one. They were friends, and Jack, counting upon their friendship, had sought his protection in this hour of sore need. Jack had helped him at a pinch, and if things had gone right, would have insured his rapid promotion in the house of Arnold & Co. Ned felt his head throbbing as if the blood were surging through the brain with such violence that

it must burst some of the blood-vessels. His throat was parched, and he took more brandy.

Yes, he would do it! The words appeared to be spoken loudly in his ear by some invisible being, and yet the voice was like his own. He started to his feet, desperately resolved to escape the temptation which was overpowering him, by rousing the sleeper. 'Jack, Jack! Rouse up, lad, and go—there is danger here!' he said hoarsely.

'It's no use—no use,' muttered the fugitive, disturbed in his sleep, but not roused from it. 'That face haunts me everywhere, and it will not let me rest. There is no escape. I am weary of the struggle. Let them come and end it all quickly. I am worn out. Death is a welcome friend.—Poor Lizzie!'

Ned stood spellbound and awe-stricken. He had been right, then: the man was enduring mental torments which would render death welcome, notwithstanding his defiant justification of his deed. Was not this a plain intimation to Ned Altcarr that the thing which had appeared to him as a prompting of the foul fiend would be a service to his friend? Muddled as his senses were, he made another effort to resist the sophistry which was seeking to reconcile his conscience to treachery.

'Rouse, Jack, rouse!—there is danger!' he cried hastily, afraid to delay, lest resolution should fail him.

He grasped Wolton by the shoulder; and at his touch, the man sprang up fiercely, prepared to grapple with a foe. Half awake, he did not recognise his friend, and seized him by the throat; but coming to himself, he exclaimed: 'Hillo, Ned, lad, what's up? I have been dreaming, and thought a constable had grabbed me.—What ails you, that you keep on shivering?'

'You have had a rest. I want you to slip out by the back of the cottage. You are not safe here.'

'Has anything happened? Have you heard anybody about?'

'No; but you are not safe here,' was the evasive but truthful reply. 'When I went out to get the things, I learned that old Arnold has added five hundred to the reward offered by the authorities for your apprehension.'

'That will make six hundred. Didn't think I was worth so much. Well, he'll be a lucky chap who gets it. But if there are no signs of immediate danger, I'll lie down again. Heaven only knows when there will be another chance for a sleep.'

'I wish you would go. The detectives may come at any minute. I tell you again that you are not safe here.' Ned spoke earnestly, almost pleadingly; for he was trying to save himself from himself. His necessities were so great, that he knew it would not be possible to resist much longer the temptation which was thrust upon him.

'Safer here than anywhere else, Ned, so long as you keep watch,' answered Wolton, stretching himself on the bed again. 'Let me remain for this night in peace. To-morrow night—ah, well, we had better not think of that.'

Ned was irritated by this stupid rejection of his warnings; and still more irritated when he perceived that Wolton was asleep again. He, Ned Altcarr, who had committed no crime, could not

sleep; and yet here was this man, with blood upon his soul, sleeping soundly!

The candle started into a broad flame as the paper which was wrapped around the base, to make it fit the candlestick, caught fire; then it went out. This time, Wolton did not breathe heavily; he slept as peacefully as a child, as if no sorrow, no regret, no crime lay upon his conscience. The darkness and the silence were terrible to Ned Altarr. He had done his best to warn his friend of the danger which beset him. He had done his duty as a friend; now, he must do his duty as a citizen of a law-abiding country, and as a man who had to find food at anyrate, and comfort if possible, for those dependent on him.

He went forth stealthily, opening and closing the door with the least possible noise. He proceeded to the police station, and had a brief interview with the superintendent on duty.

'There is a reward of six hundred pounds offered to any one who will give such information as will lead to the apprehension of the man who murdered Mr Percy Arnold?'

'Yes,' answered the superintendent, eyeing the speaker with an expression of curiosity and doubt. 'Have you got any information?'

'I can show you where to find the man.'

Every nerve in Altarr's body quivered as he spoke the fatal words; but he appeared to be calm. He was insensible to pain of mind or body. Sullen resolution to do this thing sustained him. Six hundred pounds! There would be no more starving, when he possessed that fortune.

After some sharp questioning, the superintendent summoned two constables, who proceeded with Altarr to his cottage. He told them to go in, directed them to the room where they would find the man who was wanted; but he remained outside, in the bleak light of the first flush of dawn on a cold misty morning.

### SOME CURIOUS WAGERS.

So far as we can go back in the world's history, we find the rage for making wagers prevalent. The Romans had a great taste for wagers and bets; and they had a conventional form of ratifying these contracts, which consisted in taking from the finger the ring which the higher classes invariably wore, and giving it into the keeping of some third party or umpire. One of the wildest bets ever made was that of a physician of the ancient world named Asclepiades. He wagered against Fortune that he would never be ill during his life, under penalty of losing the reputation he had acquired of being the most famous physician of his time. Absurd and impious as was this presumption, he won his wager, although he could not enjoy it, for, at a very advanced period of life, he died from the effects of a fall down-stairs.

The Romans were forbidden by the *lex Titia* and the *lex Cornelia* to bet upon the success of any unlawful game, or indeed of any games whatever, unless they were trials of courage, bodily strength, or skill. In the later days of Rome, her citizens were prohibited from making wagers upon the death or exaltation of the popes and on

the promotion of cardinals. At Venice, no wager might be laid upon the election of persons to fill the public offices; at Genoa, on the revolution of states or kingdoms, the success of military expeditions, the arrival and departure of vessels, or proposed marriages. Somewhat similar to this last was an Act of Parliament passed in Paris in 1565 which rendered it illegal to make a woman the subject of a wager.

The parliament of Dôle, in France, was called upon to decide a very curious wager in the year 1634. It was between two citizens of Pasmes, one of whom had agreed, on consideration of his being paid the sum of twenty-four francs, to furnish the other with a quantity of grains of millet, in proportion to the number of children that should be born within a certain extent of country during one year. He was to hand over one grain for the first child, two for the second, four for the third, and so on, always doubling the number of grains for each successive birth. The number of children born within the specified time was sixty-six; and such an enormous quantity of grains of millet had to be supplied to meet the conditions of the agreement, that the contracting party demanded the cancelling of the bet, on the ground that it was founded upon an impossible condition. The court agreed at once that it was impossible for the contract to be carried out; and decided that the person who had received the twenty-four francs should repay them to his opponent, and should give him an additional sum of twenty-four francs. Surely this was anything but a just judgment, for it was impossible that the gainer could have lost. He had made his calculations, and was betting upon the ignorance of the loser. It was therefore a wager based upon bad faith, and should have been annulled altogether.

A wager was made early in the last century by a banker named Bulliot. He was a firm believer in the superstition that if rain falls on St Swithin's day (July 15), it will also fall, more or less, for forty days after. St Swithin's day in the year 1725 was very wet; and so Bulliot offered to bet any one who chose to put down his money, that the next forty days would be rainy. So many persons showed a desire to take up this wager, that its terms were reduced to writing as follows: 'If, dating from St Swithin's day, it rains more or little during forty days successively, Bulliot will be considered to have gained; but if it ceases to rain for only one day during that time, Bulliot has lost.' On these terms, Bulliot betted against all who presented themselves. He was so confident of success that he placed money against articles of value of every description. People brought gold-headed canes, snuff-boxes, jewels, even clothes; and Bulliot wagered as much money against them as he considered they were worth. When his stock of cash came to an end, he issued notes and bills of exchange to such an extent that it was said he had paper money out to the amount of a hundred thousand crowns. All this naturally excited a great deal of public curiosity, and the rash man found himself quite fashionable for the time being. Verses were made in his honour, a play was produced which had him for its hero, in a word he attracted as much attention as if he had been a monarch or a famous statesman. But,

unfortunately for Bulliot, St Swithin was not true to his character. For the first twenty-one days of the stipulated time, more or less rain fell. The twenty-second day, however, was bright and cloudless, and night came on without there being the slightest sign of rain. Bulliot was ruined, and ruined so completely that he was unable to meet the notes and bills that bore his name. The holders of these tried to enforce payment; but the ancient law did not recognise debts of this kind, any more than does the law of more modern days. They were accordingly non-suited, and their debts declared irrecoverable.

In the early part of the present century, sporting-men were fond of betting on the duration of the lives of celebrities. Napoleon I. was specially the subject of these wagers. It is related that at a dinner party in 1809, Sir Mark Sykes offered to pay any one who would give him a hundred guineas down, a guinea a day so long as Napoleon lived. The offer was taken by a clergyman present; and for three years Sir Mark paid him three hundred and sixty-five guineas per annum. He then thought that he had thrown away enough money, and disputed further payment. The recipient, who was not at all disposed to lose his comfortable annuity, brought an action, which, after lengthy litigation, was decided in favour of the baronet.

A foreign Prince staying in Paris made a heavy bet with a member of the Imperial Club that he—the Prince—would, in the course of the next two hours, be arrested by the police without committing any offence or provoking the authorities in any fashion. The way he won his wager was by dressing himself in a tattered old blouse, a pair of mouldy boots full of holes, and a disreputable burlesque of a hat. Thus attired, he walked up to one of the most aristocratic cafés in Paris, and, seating himself at a table, called for a cup of chocolate. The waiter, as was only natural, did not care about serving so suspicious-looking a customer before he was assured that payment would be forthcoming, so he told the Prince that he must pay in advance. Upon this, His Highness pulled a bundle of bank-notes out of his pocket, and picking out one of considerable value, told him to take the price of the coffee out of it and bring back the change. The man immediately went in search of the proprietor of the café, who, when he heard the facts of the case, ordered the coffee to be served, and at the same time sent to the nearest police station for a *sergent de ville*. The Prince was of course arrested, and taken before a commissary of police. He announced his rank, and told his reasons for assuming such an unprincely costume. The authorities were obdurate at first; but finally, they consented to send the Prince under escort to the Imperial Club, where the gentleman with whom the bet had been made proved his identity, and paid His Highness the money he had fairly won.

Vieuxtemps, the well-known violinist, used to tell a strange story of a wager which he averred he had really witnessed whilst on a visit to London. It was to the effect that one day as he was walking across London Bridge, a poor wretch jumped up on to the parapet and leapt down into the river. There was at once a rush of eager spectators, and a voice shouted: 'I'll bet he

drowns!'—'Two to one, he'll swim ashore!'—'Done!' Meanwhile, Vieuxtemps had hastened to get a boat, and was rowing with a waterman to the rescue of the unhappy creature, who was floundering about, and just managing to keep himself afloat. As they reached him, and were preparing to pull him into the boat, there was a roar from the bridge: 'Leave him alone—there is a bet on!' The waterman immediately lay on his oars, refusing to make any further attempt to save the drowning man; and Vieuxtemps saw him sink before his very eyes.

A wager was made in 1806 in the Castle-yard, York, between Thomas Hodgson and Samuel Whitehead as to which should succeed in assuming the most singular character. Umpires were selected, whose duty it was to decide upon the comparative absurdity of the costumes in which the two men appeared. On the appointed day, Hodgson came before the umpires decorated with bank notes of various value on his coat and waistcoat, a row of five-guinea notes and a long netted purse of gold round his hat, whilst a piece of paper bearing the words 'John Bull' was attached to his back. Whitehead was dressed like a woman on one side, one half of his face was painted, and he wore a silk stocking and slipper on one leg. The other half of his face was blacked, to resemble that of a negro; on the corresponding side of his body he wore a gaudy, long-tailed, linen coat; and his leg was cased in half a pair of leather breeches with a boot and spur. One would fancy that Whitehead must have presented by far the more singular appearance. The umpires thought differently, however, and awarded the stakes to Hodgson.

A somewhat similar bet was one made in relation to the Master of the Revels to George II., named Heidegger, whose ugliness it was declared impossible to surpass. One of the courtiers wagered that he would produce some one who should be pronounced uglier than Heidegger. He was allowed a few days in which to unearth his champion, and it is said that he employed them in personally ransacking the worst slums of London. Somewhere in St Giles' he found an old woman whom he thought sufficiently plain to confront with Heidegger. When the two were put face to face, the judges said that it was impossible to decide which of them was entitled to bear the proud title of 'ugliest being in London.' A courtier, however, suggested that Heidegger should put on the old woman's bonnet. This he did; and the additional ugliness it gave him was such that he was unanimously declared the winner.

A notorious gambler of the last century finally ruined himself by a very extraordinary bet. He had been playing with Lord Lorn; their stakes had been very high, and luck had gone steadily against him. Exasperated at his losses, he jumped up from the card-table, and seizing a large punch-bowl, said: 'For once I'll have a bet where I have an equal chance of winning! Odd or even, for fifteen thousand guineas?' 'Odd,' replied the peer calmly. The bowl was dashed against the wall, and on the pieces being counted, there proved to be an odd one. The rash gambler paid up his fifteen thousand guineas; but, if tradition be correct, it was only by selling the last of his estates that he was enabled to do so.

Some years ago, a gentleman made a heavy bet that he would stand for a day on London Bridge with a tray full of sovereigns fresh from the Mint, which he would be unable to dispose of at a penny apiece. A nursemaid bought one to quiet a crying child; but no more were disposed of.

### REMINISCENCES OF AN OLD PHYSICIAN.

THEY call me 'the *old doctor*.' Of course, my long white beard and the scant thatch on my head bear witness to the veracity of the term; and I have but to look at my stalwart grandsons to be fully assured that the adjective applies to me; nevertheless, I fancy that a spice of irony is implied in it. The go-ahead men of the present generation consider me out of date entirely—my ideas antiquated and obsolete. Well, I should not wonder if they are; for I suppose no branch of science has made such rapid and wonderful strides as that connected with the profession to which I have the honour to belong. No doubt, I am of the old school. I am resting on my oars now. The strife and struggle of life are over for me; and as I sit at my ease in my old armchair, memory takes me back to the past. I think of my student days, and I see before me those grand men whose footsteps first beat into the track which has led to the present heights of research and of discovery. Abernethy was one of those splendid pioneers. I think I see him as he used to lecture at St Bartholomew's: small of stature, nose *retroussé*, eyes small, dark, and restless, gleaming alternately with wit and humour, or lit up with ineffable tenderness. A face comical and satirical, if you will, but full of expression; and crowned with a raised tuft of well-powdered hair, ending in a long queue. His was among the last of the pigtails. Then, to add to the quaintness of his *tout ensemble*, he had a knack of thrusting one hand into his breeches-pocket while he gesticulated with the other. No lecturer in London could rivet the attention of his pupils as he did, so lucid were his descriptions, so powerful his language, so dramatic his action. Abernethy was far from being the coarse man that some of the clumsy imitators of his naive brusqueries would lead one to imagine. True, he would launch his little winged darts of satire ruthlessly at the manifold affectations of self-indulgent invalids: he had small sympathy for such; and no regard for rank or wealth of themselves. But when his feelings were enlisted, when called on to witness real suffering, real distress, who so kind as he? And then, when poverty was superadded, the recording angel alone might tell of his benevolences.

Although a great admirer of Abernethy, the hero of my boyish worship was Sir Astley Cooper. The lives of these two great luminaries for long years ran parallel. With Sir Astley I came more into personal contact; and assuredly he was the first surgeon of his day and generation. He was President of the College of Surgeons when I went up for my examination for membership. I had just gone through the fiery ordeal, and was drawing my breath triumphantly, when Sir Astley, using his privilege as President, called my attention: 'Describe to me, sir, the origin and distribution of the fifth pair of nerves.' I quailed for

an instant, taking in, as one does at such moments, the whole beauty of his magnificent physique; then gathering up my somewhat scattered senses, I answered slowly, deliberately, and I trust also clearly, for I heard him say 'Capital!' No word of praise either before or since could have the electric effect of that trisyllable. It was positively intoxicating. My fortune seemed to be made from that moment.

There was a wonderful fascination about that man. We students treasured every little anecdote connected with him. One I especially remember. Sir Astley had a pupil boarding with him, a young man belonging to a wealthy and very honourable family. He was treated as a son, and shared the surgeon's confidence. He was somewhat extravagant; but as his allowance was ample, this fact scarcely attracted attention. One day, however, Sir Astley was startled to find, on examining his banking book, that a large sum had been drawn out, for which he could in no way account. He went straight to the banker for an explanation. 'There must be some mistake,' said the surgeon; 'I have certainly never drawn so large a sum.'

'It was drawn out on such a date,' returned the banker; 'and here is your cheque, duly signed.'

Sir Astley examined the cheque. He was a man of quick perception; he knew it to be a forgery; but not a muscle of his face betrayed that fact. 'Oh, indeed. Ah, yes; I see. You are quite right; the fact had escaped me. Yes—yes; you are right.' Sir Astley left the bank.

Not a single word was spoken during the whole of that day; he would do nothing hastily; he required time for thought.

The next morning, the young man was summoned into the library. The door was closed. Calmly, but stoutly, Sir Astley charged him with the forgery. It simply meant hanging in those days. Imagine, if you can, the blanched cheek, the stammering words of the unhappy culprit. He threw himself at his master's feet and cried piteously for mercy. His whole life had been wrong—one tissue of wrong-doing. Step after step he had sunk in the slough, and now, ruin, utter, irrevocable ruin was the result. He never attempted to exculpate himself; too well he knew that nothing but a full and open confession could avail with a man of such lucid discernment, such scrupulous honour, and high integrity as Sir Astley.

'Sir,' said the baronet, 'for the sake of your excellent parents—and for your own—I will consider the matter. You will meet me here to-morrow morning at this hour.'

Those twenty-four hours must have been agony for both master and pupil. The morrow came.

'Sir,' said Sir Astley sternly, 'I pity your case. Your talents, your position, and the kindness of your nature, all augured better things. Your utter weakness has been your ruin. You have disgraced yourself. You have sunk to the level of a felon. It would be death to my honoured friends, your parents, if they were to have the smallest suspicion of this. I have determined to give you one chance. I have been able to obtain for you the post of surgeon to one of His Majesty's colonies. That will be sufficient for your maintenance. If you prove yourself faithful to your duties and to your promises of amendment,

an opportunity will be afforded you of obtaining a private practice. You may do well. One condition I exact from you—you will not return without my consent, or you know the consequences. I will vouch for your ability, your thorough efficiency. Only be true to yourself and to your word, and you may retrieve your lost honour. You may with time prove yourself an honest man.—Now, go. You must sail within this week. Tell your father I am sorry that the leave-taking must be so brief; but it is a good post, and I desire that you should fill it.' This was a long speech for a man of few words, as Sir Astley was, and his voice—firm at first—almost broke down.

As for the delinquent, he only answered by tears, truly tears of repentance.

The youth's father, unconscious of the magnanimity of Sir Astley's conduct, was grateful to his friend for forwarding his boy's prospects.

'May I be allowed the honour, the happiness, of writing to you, sir, from time to time?' was the poor misguided lad's request as he bade his generous patron farewell before he sailed.

The permission was granted.

It is pleasant to record the fact that Sir Astley Cooper never had occasion to repent his noble conduct. The young fellow succeeded beyond all expectation. He was an ornament to his profession. His gratitude showed itself in every act of his life. Gratifying it is to be enabled to add that he paid back the purloined money with full interest; and when he returned to his native land with a well-earned fortune, his name was unsullied, the secret had been so generously, so tenderly kept.

I said that Sir Astley Cooper possessed wonderful discernment. An instance of it occurred whilst I was studying. A gentleman of high position had been foully murdered. The excitement thereby created was immense. Sir Astley Cooper was called in to examine the body. Before leaving the house, the surgeon said to a friend: 'Patch committed the murder.'

Patch was a servant. He had been giving evidence; and had shown himself assiduous, officious, and affectionately concerned. It was a bold speech, unhesitatingly uttered: 'Patch committed the murder. I would stake my life Patch did it.'

Patch was thereupon arrested. The matter was clearly gone into. Patch was hanged on the most undoubted evidence.

## GIANT EARTHWORMS.

In any group of animals, there are always a number of huge forms at one end of the series, which gradually dwindle down to the tiniest creatures at the other extreme. In that group of animals to which we ourselves belong, we have the titanic whales on the one hand, and the minute shrews and fieldmice on the other. Consciously or unconsciously, we make use of the human body as a standard of size in all animals familiar to us; perhaps also in smaller creatures we adopt the mean as a standard, and speak of all those that exceed in size this selected standard as being large. A group of animals that is perhaps not very well known to the readers of this *Journal* exemplifies what has just

been said in a very striking fashion. Any person would at once say that an earthworm is a small creature, never exceeding a few inches in length; but as a matter of fact, there exist in many parts of the world colossal earthworms which are four, five, or even six feet in length. Some few years ago, a description came to this country of a mysterious creature which lived below the ground, and, as it burrowed its way through the earth, felled all the trees that stood in its path. This fabulous monster was reported from Brazil, where it has even received a name; the natives call it the *minhocao*, and it was believed from all accounts to be actually a representative of our British earthworm. But for the present the *minhocao* must be looked upon as a kind of terrestrial sea-serpent.

But just as the highly coloured descriptions of the sea-serpent rest upon a certain substratum of truth, in the shape of large seals, or even cuttle-fishes, so the existence of huge earthworms of six feet in length renders the fable of the *minhocao* more intelligible. These animals are mainly found in the tropics, where heat and abundant rainfall are conducive to their existence. In many parts of Natal, these huge earthworms are very abundant after heavy rains; and they have been stated by competent observers to appear on such occasions by hundreds, literally covering the ground. The huge bulk of the creatures is, however, too much for their feebly developed muscles, and they are often unable to reach their underground burrows again before the sun comes out and dries them up.

Large size is, except in some special cases, invariably a disadvantage, and leads to extinction. Among many orders of animals, the extinct forms, which are of course known to us by their fossil remains, are of huge size as compared with their living representatives; the remains of gigantic reptiles have been discovered which show that the animals when alive must have measured some sixty or seventy feet in length; and now we have only the comparatively small crocodiles and lizards. Instances of this kind might be multiplied indefinitely, but they all point to the conclusion that small size is, other things being equal, a direct advantage, and that, when a race of animals increases unduly in bulk, it is doomed to disappear. This may well be the case with the gigantic earthworms; they are not so abundant as are the smaller kinds, and they are not found so universally. We must look upon them, therefore, as a survival from a past age, that are gradually disappearing, and giving place to the smaller kinds, which are more active, and can, therefore, more readily escape their foes.

It is an interesting subject for speculation to try and imagine how earthworms first came to exist, because there seems to be a direct connection between the abundance of these creatures and the advance of civilisation in the way of agriculture. Anglers know well that they cannot get worms for bait except in cultivated ground; and where did the worms hide themselves when there was 'not a man to till the ground?' Whether they existed in the ages before the creation of man or not, cannot be said; but it is at anyrate certain that agriculture is responsible for their immense numbers,

and perhaps also for the very great diversity of species. It may be a fact new to some readers that there are an immense number of different kinds of earthworms, which have been divided by naturalists into several families; and these differ from each other quite as much as (or even more than) do the different kinds of birds or reptiles; we find, for example, that the earthworms of India or New Zealand are entirely different in their structure from the species which are familiar to us here at home. And these differences are often marked in external characters. In Ceylon, there is a large kind which is of a bright blue colour, and almost every variety in tint is exhibited by the different species. Some earthworms are phosphorescent like the glowworm and the fire-fly (it is hardly necessary, perhaps, to say that these two last-mentioned creatures are insects, not worms in the true meaning of the word), and many other creatures, chiefly insects, which are nocturnal in their habits. In the island of Sumatra, there is a remarkable species of earthworm which is well known to the natives from the fact that it makes a sharp sound during the night. It is not understood how this sound is produced, but it is probably due to the minute bristles which are implanted in the body—and which can be readily felt by rubbing an earthworm between the fingers from tail to head—grating against the small stones as the animal moves along.

The last work which Mr Darwin published was on the subject of Earthworms (see *Chambers's Journal*, No. 936), and he showed how important was the agency of these creatures in levelling the soil. As a worm passes through the ground, it swallows the earth in front of it. On coming to the surface, this earth is voided in the form of little castings, which are so conspicuous on a lawn after rain. These castings are dried by the sun and blown about by the wind, and thus tend to level the ground and to bury objects lying upon its surface. If some of the colossal worms were to devote their energies to this kind of work, and were as abundant as the smaller species, they could almost bury cities and drain rivers.

#### EXORCISING A GHOST.

There is, in one of the midland counties, a fine old and rather celebrated historical mansion, with towers, turrets, and mullioned windows. But alas! for all its attractive beauty; it possessed that one terrible drawback with which so many of our grand old mansions are unluckily afflicted—it had its ghost and its haunted room, which no servant would enter alone, even in broad daylight, and in which no one ever—or very rarely—slept. With the usual provoking irregularity which belongs to the whole tribe of disembodied spirits, the ghost was known to 'walk' at the most inconvenient moments, always appearing when not wanted, and carefully disappointing every party of valiant ghost-hunters whenever they mustered up courage enough for the watch. This ghost always appeared in the attire of a medieval monk—brown habit and cowl, rope-girdle, sandals, and carried a parchment roll in one hand.

About two years ago it happened that the

mansion was full of visitors, and amongst the last to arrive was a very well-known canon of the Church, celebrated for his unflinching spirits and sparkling wit. But every room was occupied. He was far too great a favourite to be refused. What *was* to be done? Happy thought—the haunted chamber! The canon, as a good priest, would, of course, have no fear of ghosts; and besides, he would know nothing of the ghost, as this was his first visit. In this, however, the good host was mistaken, for the witty canon had often heard the story and knew all about it. Accordingly, he was committed to the haunted chamber.

Next morning at breakfast, no one appeared with a brighter or happier face, or seemed fuller of high spirits and exuberant fun. 'It is quite clear,' thought the host, greatly relieved, 'he has not been disturbed in any way.'

Next morning, and the next, and the next, he still came down amongst the early ones with the same light-hearted aspect, which only those who have enjoyed sound sleep or peaceful dreams can wear. The host's anxiety at length could stand it no longer, and he congratulated his visitor on the soundness of his rest and quietude of his nights. But the witty canon, seeing his opportunity, suddenly assuming a very grave face, informed his host that his first night at anyrate had been neither quiet nor undisturbed! A sudden pause and a dead silence followed, as the canon proceeded to describe how, whilst he was lying wide awake, he was aware of the presence in the room of a tall dark figure, which came up to the bed. He observed that the figure was habited as a monk, and carried a parchment roll, with which it appeared to point. The canon ended by dwelling on its ghastly colour and its glaring, horrible eyes, as they shone forth beneath the dark cowl.

A dozen anxious questions at once poured in upon the speaker: 'What did you do?' 'Did you address it?' 'Did he speak to you?' 'How did you get rid of him?'

'How?' replied the witty canon. 'Why, very easily. I asked him to subscribe to my schools and school-treat, when he vanished immediately; and I need hardly add he has never honoured me with another visit.'

#### IN ARRAN.

THE scent of heather from the purple hills

Blends with the sweet, strong breathings of the sea.

The lark in heaven, the plover on the lea,

Stray into silence, as the star that stills

All labour, with her silvern lamp fulfils

Her kindly task, and men from toil are free.

Now gorgeous clouds like Tyrian tapestry

Engird the sun, whose light upon them thrills

Richer and fairer as he leaves their halls,

Till all the glory vanishes; and lo!

Swathed in a cloud, the little moon, new-born,

Steals timidly around the starry walls,

Until the first cool herald breeze shall blow

Upon the golden eyelids of the morn.

## BY THE BLASTED HEATH.

THE barometer has fallen somewhat since last night, and there are ominous clouds looming here and there in the west; but the sky is clear blue overhead, the white road is dry and dazzling, and the sun is as hot as could be wished. Besides, is not this in the Highlands, and who cares there for rain? Never mind the wraps, then, but grasp a good hazel staff and take to the road with a light heart. Out to the eastward, the way turns along the top of the quaint fisher town with its narrow lanes and throng of low thatched roofs, till at a sudden dip the little bridge crosses the river. Sweet Nairn! The river has given its name to the town. A hundred and forty years have passed since these clear waters, wimpling now in the sun, brought down from the western moors the lifeblood of many a wounded Highlander flying from dark Culloden. The sunny waters keep a memory still of the flight of the last Prince Charles, and their flowing has not yet washed away the stain from the pursuing footsteps of the sanguinary Duke.

Like a crow-flight eastward the road runs straight, having on the left, beyond the rabbit warren, the silver-sand beach and the sea, and on the right the fertile farmlands and the farther woods. The white line glistening on the horizon yonder, far along the coast to the east, is a glimpse of the treacherous hillocks of the Culbin shifting sands. They are shining now like silver in the calm forenoon; but, as if restless under an eternal ban, they are for ever moving, and, when stirred by the strong sea-wind, they are wont yet to rise and rush and overwhelm, like the dust-storm of the Sahara. For two hundred years, a goodly manor and a broad estate have lain buried beneath those wastes, and what was once called the Garden of Moray is nothing now but a desolate sea of sand. They say that a few years ago an apple-tree of the ancient manor orchard was laid bare for some months by a drift, that it blossomed and bore fruit, and again mysteriously disappeared.

Curious visitors, too, in the open spaces where the black earth of the ancient fields is exposed, can still see the regular ridges and furrows as they were left by the flying farmers; and the ruts of cart-wheels two hundred years old are yet to be traced in the long-invisible soil. Flint arrow-heads, bronze pins and ornaments, iron fish-hooks and spear-points, as well as numerous nails, and sometimes an ancient coin, are to be picked up about the mouldered sites of long-buried villages; but the manor of Kinnaird, the only stone house on the estate, lies hidden yet beneath a mighty sand-hill, as it was by that awful storm which in three days overwhelmed nineteen farms, altered by five miles the course of a river, and blotted out a prosperous country-side. Pray heaven that yonder terrible white line by the sea may not rise again some night on its tempest wings to carry that ruin farther!

Over the sea, looking backward as the highway at last bends inland, the red cliffs of Cromarty show their long line in the sun, and, with the yellow harvest-fields above them, hardly fulfil sufficiently the ancient name of the Black Isle. Not a sail is to be seen on the open firth, and the far-stretching waters under the sunny sky bicker with the 'many-twinkling smile of ocean.' Here, though, two miles out of Nairn, where the many-ricked farmhouses lie snug among their new-shorn fields, the road rises into the trim village of Auldearn.

How neat the little gardens are before the cottages, bright yet with late autumn flowers. Yellow marigolds are glistening there within the low fences beside dark velvety calceolarias and creamy stocks, while the crimson flowers of tropeola cover the cottage walls up to the thatch, and some pale monthly roses still bloom about the windows. A peaceful place it is, and little suggestive of the carnage that it saw just a hundred years before Culloden. Yet here it was that in 1645 the great Montrose, fighting gallantly for the First Charles, drove back into utter rout the army of the covenanting parliament. Over there on the left, among sheepfolds

and dry-dike inclosures, lay his right wing with the royal standard; nearer, to the right, with their backs to the hill, stood the rest of his array with the cavalry; and here in the village street, between the two wings, his few guns deceived the enemy with a show of force. It was from the church tower up there in front that Montrose surveyed the position; and below, in the little churchyard and church itself, lie many of those who fell in the battle. They are all at peace now; the eastern Marquis and the western, Montrose and Argyll, long ago fought out their last great feud, and departed.

The country about has always been a famous place for witches, and doubtless the three who fired Macbeth with his fatal ambition belonged to Auldearn. Three miles beyond the village, the road runs across the Hardmuir, where the awful meeting took place. It is planted now with pines, and the railway runs at less than a mile's distance; but even when the road is flooded with sunshine, there is a gloom among the trees, and a strange feeling of eeriness comes upon the intruder on their solitude. Here on the left is the gate into the wood, and the witches' hillock lies at some distance out of sight. How silent the place is! Not a breath of air is moving, and the atmosphere has become close and sultry. There is no path, for few people follow their curiosity so far. Dry ditches and stumps of old trees make the walking difficult; withered branches of the pines crackle suddenly sometimes under tread; and here and there the fleshy finger of a fungus catches the eye at a tree root.

And here is the hillock. On its bald and blasted summit it is that in the lurid corpse-light,

The weird sisters, hand in hand,  
Posters of the sea and land,  
Thus do go about, about;

when Macbeth, approaching the spot with Banquo on their return to King Duncan at Forres, after victory in the west over Macdonald of the Isles, exclaims:

So foul and fair a day I have not seen!

and the hags, suddenly confronting the general, greet him with the triple hail of Glamis, Cawdor, and King. The blasted hillock was indeed a fit spot for such a scene: not a blade of grass grows upon it; the withered needles and cones of the pines lie about, wan and lifeless and yellow; and there, where the witches emptied their horrid caldron, and the contents ran down the hill, the earth is bare and scorched and black. Even the trees themselves growing on the hillock are of a different sort from those on the heath around; and less than five miles from the spot, the moated keep of Cawdor, where the last awful prophecy was fulfilled by Macbeth's murder of King Duncan, frowns yet among its woods.

But what is this? The air has grown suddenly dark; the gloom is oppressive; and in the close heat it is almost possible to imagine there is a smell of sulphur. A flash of light-

ning, a rush of wind among the tree-tops, and a terrible crash of thunder just overhead! A moment's silence, a sound as if all the pines were shaking their branches together, a deluging downpour of rain, and the storm has burst. The spirits of the air are abroad, and the evil genius of the place is awake in demoniac fury. The tempest is terrific. The awful gloom among the trees is lit up by flash after flash of lightning, the cannon of thunder burst in all directions, and the rain pours in torrents. The ghastly hags might well revisit the scene of their orgies at such a moment. It is enough. The powers of the air have conquered. It is hardly safe, and by no means pleasant, to remain among the pines here in such a storm. So farewell to the deserted spot, and a bee-line for the open country. To make up for the wetting, it is consoling to think that few enthusiasts have beheld so realistic a representation of the third scene of Macbeth.

## RICHARD CABLE,

### THE LIGHTSHIPMAN.

#### CHAPTER XXIV.—A FISH OUT OF WATER.

'WARM, sir, or cold?' asked the boy who assisted the butler, cleaned the boots, and was generally useful about the house.

'Warm or cold *what*?' asked Richard in return.

'Please, sir, your bath. A can of warm water, or all cold, sir?'

'I don't want neither.—Bath!' exclaimed Richard.—'bath! I ain't a baby to be tubbed.—And who are you? Are you sent to tub me?'

'Please, sir, every gentleman has his bath every morning, sir. Mr Cornelis always do.'

'Every morning!' gasped Cable. 'Mercy on us—every morning! I'll have it neither hot nor cold. Take that flat pan away.'

Richard Cable's early hours surprised the household. In England, we are not early risers; we prefer the fag-end of the day to the prime of the morning. We neither rise with the sun nor set with him. The English day is like the calendar before the 'new style' was adopted, it is wrong with the sun. The scullery-maid was startled one morning to find the master laying and lighting the fire in the kitchen, to save her trouble; nor was the boy less astonished to find him blacking his own boots.

'My dear Richard,' said Josephine that same morning, 'what dirty hands you had at breakfast. What had you been doing?'

'Cleaning the boots—there are such a lot for that whipper-snapper of a boy.'

'You must not do that.—And, now I am on the subject, I have put a nail-brush in your washstand; would you mind using it?'

'Anything to please you,' answered Richard.

'And—by the way—you really must not call the butler, Sir; nor the housemaid, Miss.'

'Why not? They are as good as me.'

'It won't do; they only laugh at you behind your back. And don't address the boy as Young

Shaver; that also is not quite right.—Do not be angry with me, Richard.'

'I'm not angry,' he said. 'It's enough to make me swear.'

'Richard!'

'I only mean that it puts me in a fever to think what I ought to do and what I ought not to do. It's like what they do to lunatics—put 'em in strait-waistcoats. I seem to be in one now, and you a-lacing of me up as tight as ever you can. I'll get to like it in time maybe, but it ain't easy at first.'

'If you do not mind my speaking,' pursued Josephine, 'there is one little matter more. You managed to cut these ribs of mutton well enough last night; but you should not take the end of the chop in your hand and pick the bone with your teeth. You cut off all the meat with the knife, holding the bone with your fork.'

'But I couldn't get it all off.'

'Then send it out, cleared with the knife, as well as you can.'

'It's wicked waste.'

'I tell you it won't do. Then you wiped your fingers on your whiskers.'

'Where else would you have me wipe them? Not on the tablecloth, surely?'

'Of course not—on your napkin.'

'But that is so beautifully clean, it is a pity to dirty it.'

'It can be washed.—Richard, it won't do; the whiskers were not given to a man to clean his greasy fingers on. I saw my father laugh, and my aunt did not know which way to look. The butler ran out of the room and exploded in the hall.'

'Well,' said Cable cheerfully, 'I gave 'em a good laugh, and I'm glad of that. That butler chap seems solemn as a Methody parson. He don't seem to me like a proper human being, but to be a doll moved by clockwork. I'll try him some evening. He and I'll have a pipe and grog together, and I'll tell him some of my good stories, and see if I can't make him jolly.'

'You shall do nothing of the sort, Richard,' said Josephine sharply; 'I cannot have you demean yourself to the level of the servants.' Then seeing that he was hurt, she regretted the tone in which she had spoken, went to him, put a hand on each of his shoulders, and looking into his troubled face, said: 'Richard, I've been considering about the little ones. It won't do to have them living away in another house. It will make me jealous, for you will be always running away from me to be with them, and you will come to regard that cottage as your home, not this. Besides, if you are to break with the past mode of life, it will be best to do this altogether and at once.'

'Give up the cottage?' exclaimed Richard, and his face expressed distress.

'You will bring all the dear children here.'

'Yes,' said he, musing; 'they will like the garden; it is very pretty; but it won't quite be

like the old one, neither to them nor to me.' A look of pain was in his kind face. 'But, when the grapes are ripe, we'll go there and picnic whilst I cut the bunches.'

'There are better grapes in the houses here. The sweet-water and muscat'—

'Ain't equal to the home grapes, I'll swear,' said Cable. 'Bless me! it ain't the quality; it's the where they grows.'

'Where they grow, not grows. "They" is plural, not singular.'

'That's all,' he said in a tone of depression.

'I am afraid I interrupted you.'

'I was only thinking what larks it was—me up the ladder cutting the grapes and passing 'em down to the children; and I don't believe any other grape could taste as sweet and look as lovely as did those black Hamboros—not to the children. They grewed'—

'Grew,' interjected Josephine.

'They grewed,' Richard went on, disregarding the interruption, 'over the roof what all them little golden heads lay under; and I used to say that was how the bunches ripened on all sides alike. Above was the sun, and under were those six little sunny heads and hearts, warming the roof above. The black Hamboros couldn't do other than ripen under the circumstances, and be sweet as sugar-cane.'

'There is only one difficulty in the matter that occurs to me,' said Josephine, 'and that is about your mother. She would hardly like to come and live here with us. She would feel out of her element at our table and in the drawing-room; and yet, she will not like to leave the children. I have thought of engaging a nurse and a girl to attend to the children. But your mother—what is to be done with her? You see, she would be a difficulty if she associated with us; and we could not suffer her to associate with the servants. I am puzzled what to do.'

'Never think that she will come here,' said Richard. 'I don't believe she'd other than suffocate—not that she's asthmatical; but I fancy there's something here might take the breath away and kill her. I feel it; and I'm young. There ain't a room in the house where I can properly stretch my legs and arms, big though the rooms be, and I could do it in my little lean-to bedroom at the cottage.'

'What do you say, Richard, to her going into the lodge? She need not open the gate when carriages come; she can keep a girl to do that. There she will be near the children, and yet not in the house. I suggest this because I think it would suit all of us.'

'Don't ask my opinion,' said Richard sadly; 'it's a queer turnabout. When you came to me, you asked me to guide and pilot you; and now it is I, not you, am in unknown seas, and I know no more what to do and where to go than if I was in the desert of Sahara. It is you are pilot, not I. What you say is to be done—I must do; and where you say I am to turn my bows, there I steer.'

'Will your mother consent to come to the lodge?'

'I daresay, if you wish it. She's a proud woman, and would not like to intrude where she is not wanted. She's not been here yet, and will never come uninvited. She was born

and bred in that lodge, and there her father's body was brought when he was drowned, and there her mother died. It will be to her a home because of all the memories that cling about it. It is that which makes a home, miss.'

'You have forgotten—you must not call me miss.'

'Of course not. You're right, and I'm wrong. I'm in that state of muddle that I don't know anything. I was saying that it is the memories that make a home. It isn't the sticks of furniture, nor the carpets, nor the pictures. 'Tisn't even the live beings you put into the place; it is all the thoughts and experiences, the sorrows and the joys that take a long time a-growing, but which will grow everywhere, if you allow them the proper time. Everything here is strange to me. I don't know my way about the house yet, and the ways of life are stranger still. I reckon that even bringing the little ones here will not make a home of it all at once. But with time and patience, it will come. I remember how it was with that black Hamboro. It was a little bit of a plant given me by Jonas Flinders before ever I married Polly, struck off the vine he had. It was nothing, but it grewed'—

'It grew,' corrected Josephine.

'It grew,' said Richard, and touched his forelock. 'It grew beautifully, little by little, first the blade, then the leaf, and then the tendril and flower, and last of all the fruit; and it ran at a gallop when once it had got upon the roof, as if it could not grow fast enough, and cover enough of warm roof, and I had to pick off scores of bunches, or it would have made too many and exhausted itself. But, you understand, that was after a while, not all at once. So, perhaps, it is here. There are the cuttings put in, and we must wait for leaf and flower and fruit and the clinging tendrils—all that will come in due time, if it please the Lord. I'll bide in patience; I can't expect it all at once.'

Richard walked away, to talk the matter over with his mother. When he was out of the house and garden, by himself on the seawall, the cloud that had been hovering over his brow descended and darkened the expression of his face. Sometimes, whilst we are watching a glittering snow-wreathed Alpine peak, on which the sun is blazing, light clouds drift across the head and disappear; then others gather and cling, and by degrees the snows are enveloped in vapour, and what was fleecy becomes heavy, and what was white darkens to purple, and the whole sky is changed; the sun is no more seen, but thunder and rain riot about the mountain. It was not quite so with Richard Cable, but threatenings of a storm appeared. Whilst he was with Josephine, he had exerted great self-control. A man sensitive and diffident, he was hurt by her correction of his mistakes, at the time that he acknowledged that he was liable to make mistakes. He wished to do what was right; but in the position in which he found himself, it was not possible for him to discover within himself the rules by which to act.

The rules of social life are to some extent arbitrary, or they are founded on conditions which a man of the people does not understand. They do not spring out of the eternal principles of right and wrong, but out of social adjustments

and compromises arrived at by generations of culture. Consequently, Richard had as little knowledge of what to do, as a man who cannot swim knows how to save himself when out of his depth, with a current carrying him out to sea. He made mistakes, floundered about, was aware that he became ridiculous, and yet did not know how to avoid error, and where to find and how to put his feet on firm ground. To a man with self-respect, with strong sense of moral dignity, such a situation is eminently galling. Richard had avoided showing how he suffered, whilst he was with Josephine; but when he was by himself, the sense of humiliation, of irritation, and a brooding anger against no particular thing and no one in particular began to overshadow and darken his spirit. Several times during his conversation with Josephine a flash had passed through his mind; but it was like summer lightning unattended by muttering thunder. Now his step had lost its even swing; he walked hastily and irregularly, as his humour altered. At one moment he was hot, and a quiver of anger ran through him; then he cooled, and his breast rose as he drew a long breath. He put up his hand to his brow. 'I declare,' he said, 'I don't know whether I'm in an ague or what is on me. I never was like this afore. Well, 'tis disconcerting, when a tug that is signalled to, instead of tugging, is taken in tow.'

Josephine, after he had left, remained with her hands in her lap, looking out of the window at nothing, thinking about Richard. She was sorry that she had said so much to him about his mistakes; but really, she did not know where to begin with his schooling, there was so much to correct in his language and manners and habits. It was strange that she observed his want of refinement now, and that she had not noticed it before. Even on board the *Josephine*, it had not been observable; it was only conspicuous when he was out of his navy-blue sailor's jacket and loose trousers and flapping collar, and cap with the ribbons behind. What a fine fellow he was walking the deck! How was it that he cut such a grotesque figure in the drawing-room? She was provoked with him that he did not conform at once to more cultured life, and accommodate himself instinctively to the methods and modes of the class into which she had translated him. Then she beat down the feeling of vexation that rose in her heart, and reasoned with herself that she was demanding of him impossibilities. She was alive to his good qualities, but they were good qualities badly set. A diamond is nothing till it is cut and polished; the precious metals must be cleansed of their dross before they acquire their proper value. The roughness of surface, the inherent dross in Richard, were unpleasantly conspicuous, and the polishing, the purifying, could not be done all at once. She began to see that he would be useless to her as an adviser, and that she would be thrown back on her father, for lack of another. Her father had treated her with great forbearance, even kindness, since her final battle with him, since he saw that she was resolved to carry her point. He had not reproached her since; he had not taken advantage of the opportunities Richard had given him for letting her see that he was out of place. He did his best to thrust Richard

forward—to insist on his occupying the principal position in the house; he showed deference to him, and himself kept in the background. This was a little provoking occasionally, because Cable was incapable of taking the lead, and wanted support and direction, which Mr Cornelius, with apparent delicacy, refrained from tendering.

Richard Cable had but just returned from the cottage, and had rejoined Josephine in the garden, to tell her the result of his interview with his mother, when a handsome carriage and pair with liveried coachman and footman drove in at the gates and drew up at the porch.

'Good gracious!' said Josephine, 'there is Lady Brentwood.—Richard, do be on your Ps and Qs.'

'On my what?'

She had no time to explain, as Lady Brentwood had seen her and was waving her parasol to her.

Josephine ran to the carriage-door, and was followed by her husband. 'Richard, help Lady Brentwood down.—Let me introduce my husband, dear Lady Brentwood.'

Lady Brentwood was a tall fine woman, with almost white hair, and dark eyebrows, which she raised and depressed in a manner that made the person she was speaking with think she was being stared at and quizzed. Lady Brentwood was not above taking stock of the person she conversed with; but she was incapable of doing what was rude. The fact of her eyebrows being very marked and dark, and of the trick she had of throwing them up and then bringing them down again, and screwing up her eyes, gave her the appearance of being a quizz.

'Have you come a long way, ma'am?' asked Richard. 'Would you like some refreshment? I'm sure you look tired.'

'Thank you, Mr Cable,' said Lady Brentwood, her eyebrows very elevated, and this time with real amazement. 'I will ask your wife for a cup of tea.'

Josephine sighed. How she then wished she were cast with Richard on a desert island. They might be happy together there, but not in England. 'Shall I ever be able to get my cub licked into shape?' she asked herself, and sighed again. 'I believe my father was right; I have made a fatal mistake.'

'My dear,' said Lady Brentwood, 'you know me—you know what I am—the most obstinate creature in the world, only to be paralleled with the donkey, especially when set on wickedness. Now, I have set my heart on something tremendously naughty. I'm going to carry you and your husband off for a night, at once. I will take you away with me in my carriage. I've got Admiral Fitzgibbon, and Mr Jenkins, who is one of the Lords of the Admiralty—and, *entre nous*, knows no more about ships than an opossum—coming to dine with me, and I want your husband to be with us. He knows all about nautical matters; he has them at his fingers' ends; and Mr Jenkins will be thankful to meet him. Mr Cable will be a perfect treasure to the Lord of the Admiralty. Your husband is a specialist in his way. You see I am horribly selfish and savagely frank. I tell you everything. The fact is, I want to make an agreeable dinner-party, and I know that

your good dear husband will be the dish of dishes for Mr Jenkins and Admiral Fitzgibbon.'

'Where is the wickedness, ma'am?' asked Richard, much surprised. 'If I can be of any use, or agreeable to any one, I'm heartily willing.'

'My dear Mr Cable—is it not cruel—barbarous, to drag you and Josephine away just after your arrival, before you have had time to turn about and shake down?—before you have unpacked all the treasures you have picked up on your wedding tour?—before you have arranged the pretty presents given you on your marriage? Upon my word, I am ashamed of myself; but there—I am the most selfish woman in the world.' Up went her eyebrows. 'I have told you my reasons; I play with my cards on the table.'

'Why, ma'am,' said Richard Cable, 'I don't see that this is cruel of you, not barbarous at all, but very kind. Some folks, when they do a pretty thing, make a deal of palaver about it. But you, ma'am, as I judge, do a kind thing, and try to make it seem as if it was you who were favoured, and not we.'

Lady Brentwood raised her eyebrows; she was touched with the simplicity of the man; but Josephine thought the raised brows meant that she was amused at his simplicity and was inwardly laughing at it; so she said hastily: 'You are indeed most kind—but you are always kind.' She cast a look at her husband, intended to bid him hold his tongue and leave the conduct of the affair to her. 'But'—

'I will take no *buts*,' said Lady Brentwood. 'I have Mr Cable on my side, I am sure.'

'Well, ma'am,' he began again; but Josephine cut him short.

'I shall be very happy, dear Lady Brentwood'—she looked at her husband indignantly as she emphasised the title of her visitor—'I shall be only too pleased to be with you; but, unfortunately, my husband cannot accompany me.'

'Why not?' asked Lady Brentwood with pursed lips and raised brows.

'You see, he has so much to attend to just at present—about the yacht. There are the men.' An idea flashed through her head. 'They are to have their supper to-night, and it would perhaps hurt their feelings if Richard did not attend.'

'Can you not postpone the supper?'

'Hardly. I suppose the goose is killed and stuffed. The men will be paid off and dispersed.'

'But, my dear, we have a lawn-tennis party to-morrow, and Mr Jenkins leaves to-morrow morning. It is such an opportunity. I really have set my heart on introducing the Admiral and Mr Jenkins to your husband. You know Admiral Fitzgibbon? His wife is a charming woman, the daughter of Lord Arthur St Clair.'

A dinner at Brentwood Hall! Her husband encircled by an exalted naval officer, a Lord of the Admiralty, gentlemen of county position, ladies of high degree and perfect polish, all quizzing and observing. The idea to Josephine was intolerable. She thought of him sitting on the edge of a chair with his knees wide apart, and his great red hands on each knee, his elbows stiff, his boots shapeless, his face brown. She thought of him cutting his bread, holding the knife at

the junction of the blade and the haft, and cutting the bread against his thumb. It would never do. If he were resolved to go, she would stay at home. The colour mounted to her cheeks.

'Impossible, I do assure you, dear Lady Brentwood. You must really excuse him. In a little while, it will be different. My husband will be more free; now, his hands are tied. There are'—she hesitated—'reasons which make it necessary for him to stay; but I will attend you, if you will put up with poor me.'

'My dear,' said Lady Brentwood, laughing, 'the lavender will flourish here.'

'Lavender! What do you mean?'

'Do you know, Mr Cable?' asked the visitor with a mischievous but good-humoured laugh.

'No, ma'am—I mean, my lady.' He caught his wife's eye. 'I don't see why lavender should not thrive here; it likes a sandy soil, and the sand comes out in the garden. I can't say I've observed any in the beds; but I'm partial myself to lavender, and I'll have some put in; leastways'—he corrected himself—'I have no doubt *she* will, and if she don't care to have it here, I can plant some in the cottage garden.'

'Oh,' said Lady Brentwood, laughing, and with elevated eyebrows—'oh, the lavender will grow here.'

Josephine winced, and was hot. What did her visitor mean? Was she poking fun at her?

'You do not know?' asked Lady Brentwood. 'I'll tell you all about it in the carriage.—Well, if it must be—I must swallow my disappointment. But what shall I do? These dear fox-hunters and sporting men will talk of nothing but runs and covers; and the Admiral and Mr Jenkins will perish with ennui. You won't let Mr Cable come to the rescue. I am disposed to turn sulky; but there—I will not press you, though I feel sure, if I appealed to Mr Cable, I might carry my point. I can see it in his face. However, if the lavender is to grow, I will not interfere with its planting.'

Josephine's nerves were tingling; her fingers burnt as though she had touched nettles. On one side was Lady Brentwood torturing her; on the other her husband with infinite possibilities of *gaucherie* in him, and she did not know what he might say or do next moment. She started to her feet with a sense of relief when her father and Aunt Judith entered the room. 'Dear Lady Brentwood,' she said, and her voice, in spite of her efforts to control it, shook slightly, 'you must not try your powers of persuasion; you know that you are irresistible. It is hard of me to ask you to receive me alone; but indeed my husband cannot, must not come. It is hard for me to attempt to entertain Lords of the Admiralty; but I have had my experience of sandbanks on which one may be cast away—and I can talk of that.' Then, at once, her temples flushed, as she thought that Lady Brentwood might suspect in these words a covert reference to her unfortunate marriage.—'Here is Aunt Judith! Whilst I get together my few effects, she will entertain you.—Richard will come and help me. He is, what I am not, a neat packer. I bundle all my things into the box, and sugar them over with pins.—Come, Richard!—You will excuse us, Lady Brentwood, I am sure.' Then she whisked out of the room,

followed leisurely by Cable. She slid her hand up the banister, and clutched it tightly at every few steps with convulsive twinges. She was in a state of quivering nervous excitation.

## TWO RECENT IMPROVEMENTS IN LIGHTING.

BY AN ANALYTICAL CHEMIST.

### I.—INDOOR LIGHTING.

CONSIDERABLE attention has recently been paid to the subject of domestic illumination, on account of the rivalry which has sprung up between gas and electricity since the latter began to make such headway in popular favour. If electric lighting had done no other good than that of rousing into activity the dormant gas Companies, it would still deserve a large amount of public gratitude. Those interested in gas have, ever since the electric light assumed a prominent and threatening position, made every endeavour to lower its price to the consumer, to improve its illuminating power, and, as if to prepare for the very worst, to find new applications for it, as in gas-engines, for cooking and for heating purposes. In the latter they have been singularly successful, for already the consumption of gas for cooking purposes alone is very great. The illuminating power of gas has also been increased, partly by more careful manufacture, and partly by improvements in the form of burner.

The luminosity of gas may be improved in three ways: Firstly, by the introduction of heavy gases or vapours of greater luminosity into the ordinary gas flame. These vapours burnt alone would smoke to an unpleasant extent; but when diluted with gas, they burn clear, and increase the power of the latter. The Albo-carbon Light is a successful application of this principle. Here the vapour of naphthaline is in small quantities automatically intermixed in the flame with a very brilliant result. Secondly, by increasing the temperature of the gas, or the gas and air, before combustion. The Wenham and the Bower regenerative burners are examples of this form of improvement. Thirdly, by the introduction of some incombustible substance which at a high temperature becomes itself luminous. No more familiar illustration of this principle can be given than the limelight. Here two gases—hydrogen and oxygen—are burnt in proper proportions; the flame produced is non-luminous, but intensely hot; it is allowed to impinge on a small cylinder of lime, which at this temperature becomes so highly incandescent that the light it emits is exceedingly dazzling and brilliant. It is the light most commonly used for magic-lantern purposes; but it is troublesome, costly, and dangerous.

Persons interested in gas illumination are familiar with a number of ways of applying the foregoing principles, on which improvements in the luminosity of gas flames are founded; but, with the exception of the systems above named, there are only a few which have proved a commercial success.

The improvement about to be recorded here belongs to the third principle stated above, and it may simply be regarded as an imitation of the limelight in a form suitable for domestic purposes. The limelight cannot be used ordinarily because

the temperature of coal-gas flames is too low to render the lime cylinder incandescent. Some substitute for lime must therefore be found which becomes incandescent at easily attainable temperatures. Such a substitute Clamond found, a few years ago, in threads of magnesia supported on platinum netting. The present improvements by Dr Auer Welsbach, of Vienna, and Mr James MacTear, lately of Glasgow, and of artificial diamond notoriety, were but steps in the same direction, and resulted in the employment of materials better suited to the purpose, but rarer than lime or magnesia. These two inventors have worked in lines very similar to each other, so similar, indeed, that we find Mr MacTear's name among the directorate of a Company about to be established for the sale of the Welsbach system of incandescent lighting, and it would not surprise us to hear that the two systems are incorporated.

Dr Welsbach uses a cowl of specially prepared cotton or wool about two and a half inches high, and of a diameter to suit the size of the burner. The cowl is supported by platinum wire held by iron rods or by other means. The cotton or wool is impregnated with a solution of certain salts of zirconium, and lanthanum or yttrium; and when heated, the cotton or wool burns away, and a network incrustation, consisting probably of the oxides of the metals used, remains, and becomes highly incandescent. The cowl cannot be placed on the ordinary yellow flame of gas, on account of its low temperature, and its tendency to deposit soot on any cold body brought in contact with it. The ordinary flame is therefore, by a simple arrangement for the admission of air into the gas previous to combustion, converted into the blue atmospheric flame, which is sufficiently hot to render the netted cowl incandescent. It is said that each cowl costs a farthing, and it burns with undiminished brilliancy for a thousand hours.

Mr MacTear's system differs from the preceding only in the shape of the burner and the salts used to produce incandescence. He winds the fibrous material round a thin platinum wire, and then twists this cotton-covered wire into a helical, a spiral, or a gridiron-like form. He saturates this wick with hydrate of strontium, then dries and ignites it, leaving oxide of the same metal. Or he may add to the same wick hydrate of zirconium in addition; or a soluble salt of barium or of thorium alone, or in combination with any of the preceding. As before, these salts when ignited leave an incrustation, which assumes the shape and position of the fibrous material which burns away.

It is certified for this system that the saving of gas is fifty per cent., and that each cubic foot of Glasgow gas consumed gives, with the Welsbach burner, on an average a light equal to about nine candles. It is also stated that the burner can be adapted to the ordinary gas fittings at a trifling expense.

Whatever may be the future of the light, it is certainly an inexpensive improvement on ordinary gas flames, and commends itself to us more particularly by the soundness of the principles upon which it is worked.

#### II.—OUTDOOR LIGHTING.

When large building or mining or kindred operations are carried on in the open air, there is

some difficulty in getting a sufficiently powerful light at a moderate expense. At the present time, the electric and the lime lights are the only ones suitable for this purpose. Both are satisfactory so far as illumination is concerned; but they are too costly, and, as a rule, too troublesome. No builder would dream of transporting the apparatus necessary for the production of the electric light to a job lasting a few hours or even a few days, on account of the heavy expenses such transportation would entail. The limelight, if it were not for its cost and the risk of explosion, commends itself particularly as an itinerant light. There is no heavy machinery belonging to it, in fact no machinery at all. Everything is ready to hand, and the light can be produced in less than five minutes. The oxygen and hydrogen contained in the bags may be comfortably carried on a boy's shoulder, and the lamp, which is simplicity itself, in his hand, so that the cost of transport is not worth taking into account. But the gases oxygen and hydrogen are very expensive, and, in places remote from large towns, almost impossible to obtain. This is the greatest drawback to the limelight.

That a want existed for a cheap and practical outdoor light is evident, and this want has been supplied by Mr J. B. Hannay's light, known commercially under the name of 'Luceigen.' It is not a little singular that the two Scotch chemists mentioned above—Messrs MacTear and Hannay—should have their names associated about the same time with two new systems of lighting; for it will be remembered that soon after Mr MacTear announced that he had discovered a method for manufacturing artificial diamonds, which did not turn out quite satisfactory after all, Mr Hannay also announced a similar discovery, with the result that his diamonds stood the tests of experts, but were declared of too small a size to be of any use commercially.

To enter into a full description of Mr Hannay's lamp would be out of place here. Suffice it to say that the construction is very complicated, and purposely designed to admit of the use of the very crudest oils—oils practically without commercial value. The ordinary lamp of two thousand candle-power holds thirty gallons of oil; but smaller sizes are made. The oil is burned in the form of spray, the spray being produced by the action of compressed air. An air-compressor is therefore required for the working of the lamp, and may be worked by hand or by steam. Steam-crane are now so commonly used in buildings, that no extra expense is incurred in compressing the air. A light of two thousand candle-power can be obtained at a cost of about threepence an hour, according to the statement of the inventors; but, according to the certificate of Dr Wallace of Glasgow, the cost must be even less, for he found that the thirty-gallon lamp consumed nearly two and a quarter gallons of oil (costing barely twopence) per hour, and gave a light equal to two thousand seven hundred and ninety-six standard candles. The light has had a fair trial, and general satisfaction is expressed by those who use it. It is eminently suited for industrial purposes, as the lamp will burn almost any kind of oil. The cheapest oil that can be obtained is creosote oil, price about one penny a gallon, or even less, and

this is the kind generally used. It can be obtained at the gasworks; and as gasworks are so numerous and scattered, there is no difficulty in obtaining it.

One great advantage possessed by this light is that it does not require protection from aerial currents. Indeed, the storm produced within the lamp by the compressed air is so great that the flame defies any storm from without. The noise made by the flame is sufficient evidence of the violence of the storm which is going on within the lamp. The flame is also so long—about three feet in the two-thousand-candle lamp—that the light is well diffused, and the objectionable black shadows produced by the electric light are entirely absent. The flame can be bent into any position—horizontal, vertical, or at any angle with these positions. This is a great advantage for some purposes. Another advantage is, that the total original cost for plant is said to be only one-fourth that required for the electric light; and the machinery being of a much lighter description, can be more readily transported from place to place.

This light promises to have a successful future; and in conclusion, it is only fair to say that associated with Mr Hannay in the patent taken out for the lamp is the name of Mr Lyle, to whom, as engineer, probably belongs the credit of devising the mechanical arrangements of the lamp, which is of most ingenious construction.

## BLOOD-MONEY.

### IN FOUR CHAPTERS.

#### CHAP. II.—TWENTY YEARS AFTER.

RIVELING HALL was about two miles from Sheffield, and the Riving water ran by the foot of the park. The grounds were extensive for a merely suburban residence; and the house was large, but less pretentious in its style of architecture than its title would have suggested. It was the property of Richard Edwards, Esq.

This gentleman had arrived in Sheffield about twenty years ago; and, having a small capital, had invested it in the business of a clever but impecunious man. Under the direction of Edwards, the trade of the firm rapidly developed. Year by year its reputation for thorough work extended, and the demand for the productions of Messrs Edwards and Clark increased. The little workshop in which Edwards had found Clark grew into a huge building, in which two hundred people were employed. The restless energy of Edwards carried everything before it; and, on the death of his partners, he, being now free to act as he pleased, added still further to the works. Some marvelled at the rapidity of his rise in the manufacturing world; some envied it; but although he obtained the homage which wealth can always command from the majority of mortals, there were few who sincerely called him friend. In his success he was generous. He built churches, subscribed munificently to local and general charities, and no real case of distress which was brought under his notice was ever

allowed to remain unrelieved. Whilst prosperous in the highest degree in business, his domestic life was one of profound gloom. He built Riving Hall, and wedded a lady who possessed a considerable fortune. Children were born, and passed away one by one before the joys of paternity could be realised. Then his wife died, and Edwards was left with increased riches, but a cheerless home.

About this time he brought from a French boarding-school a girl about fifteen years old, who was understood to be his daughter by a former marriage. As Lizzie Edwards was a bright and beautiful creature, he doubtless supposed that she would bring some happiness to the desolate hearth. Whether she did so or not, no one could tell. The girl was supplied with all the luxury that heart could desire; but in her twentieth year, although more beautiful than when she first arrived at the Hall, she did not appear to be so light-hearted as she had been then. There was an old housekeeper who shook her head, and whispered in confidence to her cronies: 'There seems to be a curse on this house.'

On a bright day in June, there stood, under the shadow of a beech-tree at the foot of the park, a man, who was looking eagerly towards the Hall, and was evidently watching for the coming of somebody. He was young—about twenty-eight—and well favoured by nature in face and figure. He wore a dark tweed suit, and a low-crowned felt hat. Youth and strength were his, and yet, on this bright day, there was trouble in his heart. But the sunlight flashed in his eyes when he saw a girl, simply but prettily dressed, emerge from the house. She put up her sunshade, and walked—leisurely, as it seemed, like one who is merely taking an airing—across the park in the direction of the beech-tree.

'She is coming, then!' the man whispered joyfully to himself, as he drew back a little, so that the trunk of the tree stood between him and the house.

When the girl was near the tree, she gave a hasty and frightened look backwards, as if to assure herself that she was not followed. No one was visible, and she cautiously quickened her steps. This was Lizzie Edwards; and he who was waiting for her was George Corbet, a civil-engineer, in business in Sheffield.

'I am grateful to you, Lizzie, for this proof of your confidence in me,' he said fervently.

The girl's hand trembled in his. She seemed half afraid to look at him. 'Did you need any proof of that?' she asked simply, and raised her eyes.

'No, no; and I will try not to repeat that mad proposal of flight. But you told me to hope and wait.'

'And I repeat the words now—hope and wait.' The words were accompanied by a faint smile, intended to comfort him.

'Then what I have heard is not true—you have not consented to marry Sir Joshua Wigan?'

'My consent has not been asked. My father expects that, having told me, I must not think of you: time and separation from you will bring me round to his wishes, by enabling me to under-

stand and appreciate the great honour intended for me.'

'And but for me, you might accept that honour—ay, and be happy, perhaps, for Sir Joshua is known to be a good fellow,' commented Corbet gloomily. 'You are barred from a position most women would be proud of, by my selfish love.'

'And my own,' she added with gentle chiding in her voice.

'Ah!—that is my justification.' The glad light was in his eyes again. 'But if I thought that by going away and giving you time to forget me, as your father wishes—if, by doing this, I thought your happiness would be more assured than it can be by me, I think I could do it.'

'Hush, George! You know that I cannot forget you; and if you were capable of such cruelty, I should suffer, but could not forget.'

'I am sure of it, my darling; and that is why I do not mean to make such a useless sacrifice. But we must look our position square in the face. You are the daughter of a wealthy man; and I am comparatively a poor one, with only "prospects" to reckon in my favour. Your father refuses to wait until some of these prospects are realised. We cannot blame him for that—at least not much.'

'But I understand, Sir Joshua is not rich,' she interrupted.

'He has his title and his pedigree, and they are worth a great deal in the eyes of some people. Your father is one of them, and he thinks that the best he can do for you is to give you to this worthy man. We think differently, and can offer no other explanation for our audacity than that we love each other.'

'Is that not enough, George?'

'To us, yes; but to your father, no. We are fools, in his opinion, and blind ones too, for we cannot see that he is only saving us from an act of folly, which, if committed, we should bitterly repent. We don't believe that, and he asserts his authority. He forbids our engagement, and presents to you the man he has chosen to be your husband. He will use his authority still further, and insist upon your obedience. Do you think you are strong enough to hold out against his arguments, his persuasions, and his commands?'

It was difficult for the girl to answer this question. She believed that she would be strong enough to hold out against every influence brought to bear on her; but when thought with its instantaneous photographic power presented to her the picture of the rebellious attitude she would be compelled to assume towards her father, she hesitated, doubting herself, and afraid to pain her lover by any faltering answer. She knew that no arguments, persuasions, or commands could alter her affection; but what she might do to escape constant persecution, it was not easy for her to decide. Then she looked at Corbet, and meeting his eager, inquiring gaze, she answered impulsively: 'Yes, I am strong enough to resist them all; but my father will not insist when he sees that insistence is useless. He will not insist when he sees that if I did consent, I should be miserable.'

'I hope it may be as you believe; but—Lizzie, the day is already fixed for your marriage. Your father is not to wait until you have forgotten me;

he has decided to carry out his plans at once, in order to give us no chance of spoiling them.'

The girl stood dumbly gazing at her lover. Surprise and dismay were in her expression. She only said under her breath: 'There *must* be some mistake—it is not possible that my father would do this without one word to me.'

'I did not think he would; but he has—he himself told me yesterday. That was why I asked you to meet me here.'

'Oh, but he must have spoken when he was in anger, and in the hope that the statement would discourage you.' She was seeking vainly for any explanation which would tally with her own wishes. She could not bring herself to believe that her father would attempt to force her will by publicly announcing the marriage, so that, in dread of the scandal which her open rebellion would cause, she might yield.

'He was angry; but he meant what he said.—Now, my poor Lizzie, how are we to resist him?'

'I do not know. But they *cannot* force me. No, no; they will not try. My father is cold—sometimes harsh, maybe; but he does desire my happiness; I am sure of that. It is only because he is so proud of me that he wants to bring about this marriage.' She had been speaking excitedly, but suddenly checked herself, and said calmly: 'No matter what they may do, George, I am yours until you reject me.'

He clasped her hands in his: there was no need to speak; no need to repudiate an impossible contingency. His silence was a more solemn assurance of constancy than the loudest protestations in words could have been. She felt it so, and there was infinite trust in the tender blue eyes which gazed into his. Whatever evil fortune might befall him, he had one possession which Fate could not take from him—the love of a true woman. He knew it, and the knowledge made him strong.

The blissful silence was disturbed, and the confident smile faded from their faces, when Corbet, looking up, saw Mr Edwards advancing towards them. 'Here is your father,' he said quietly; 'I suppose there will be another rumour; but do not fear; I shall keep my temper.'

Instead of trying to avoid the father, they advanced to meet him. Lizzie could not help a slight feeling of trepidation; but she, like her lover, was conscious of some new strength within her which would sustain her against any wrath or tyranny that might be exercised upon her.

Mr Edwards bent his head in recognition of Corbet as they halted. 'You can say good-bye to Mr Corbet, Lizzie, and go into the house; I want to speak to our friend.' There was no anger or irony in his voice; he spoke as if there were nothing strained or unusual in the position of affairs.

She obeyed him; and as she slowly made her way back to the house, the two men stood face to face—both calm and both resolute.

Mr Edwards was a short, square-shouldered man, verging on his fiftieth year; but although his clean-shaven face should have made him look younger, the deep furrows on his brow and under the eyes combined with the plentiful sprinkling of gray amongst his crisp black hair to add at least ten years to his apparent age. His features

were rugged, and suggested a hard indomitable nature; whilst his quick, pale brown eyes indicated restlessness of spirit rather than energy. In spite of this contradiction of his physiognomy, he gave the impression of being a man with whom one would not care to quarrel lightly.

'I am sorry, Corbet,' he began in a subdued voice, 'that I spoke so hastily at our last meeting—all the more sorry, as your presence here to-day proves that my words made no impression on you. For my haste and anything unpleasant I may have said, you must find excuse in my anxiety about the future of my daughter, and in the fact that you have so seriously interfered with my plans for her welfare.'

Corbet was as much confounded by the manner as the matter of this address. He had anticipated wrathful reproaches, and had prepared himself to meet them with a resolute refusal to abandon his hopes of yet convincing Mr Edwards that Lizzie's happiness could not be secured by trying to separate her from the man she loved. But he was completely taken off his guard by the mild tone and the apology of the father.

'Certainly, your reasons for feeling annoyed are ample,' he said frankly; 'and I trust that you will admit my reasons for declining to accept your decision as final are also good.'

'From your present point of view, yes. When you are older, if you ever think of my position, you will acknowledge that in acting as I am doing, my conduct is prompted by a natural desire that my daughter in beginning life should have the advantage of my experience.'

'Without waiting to be older, I acknowledge that you are actuated by the best of motives; but I can never acknowledge that you are right in taking Lizzie from me, unless you know something which justifies you in believing me unworthy of her.'

'Then your idea is, that a perfectly inexperienced girl may decide for herself on the most important step in her life, without regard to the wishes or judgment of her parent?'

'That is rather a hard and fast way of putting it, Mr Edwards. I certainly do not mean that your wishes or judgment should be disregarded; but on your side, I think you are bound to consider her wishes.—Now, tell me straight out what is your objection to me?'

'One that you will not appreciate: you cannot give her the position I desire her to attain.'

'And in order to give her the position which would gratify your own vanity, you would sacrifice her happiness!' exclaimed Corbet passionately.

Mr Edwards remained perfectly calm; indeed, he seemed to be sorry for the young man, and ready to make all due allowance for his excitement. 'I do not think her happiness is at stake,' he answered quietly, without any reference to the charge against himself. 'So far as you are concerned, I own that you have made a deep impression on her mind; but she is too young for that impression to be permanent. You also are in the same position; and one day you will both thank me for having interfered with this youthful fancy.'

'Never!—I think you do not know Lizzie, and I am sure that you do not know me.'

'That may be; but I know myself; and unless

you can give me more tangible evidence than mere assertions of ineradicable affection, and so forth, that the course I have chosen for my daughter will mar not make her future, I shall claim a parent's privilege to guide her, and, if necessary, to command her obedience.'

'But you cannot command my obedience to your will; and as I know that she will be true to me, you will be obliged to submit in the end.'

'You speak more like an audacious schoolboy than a man of common-sense, Corbet; and in so doing, you are proving to me that my decision is the right one—you are too impulsive to be a safe guardian for my daughter. She will obey me.'

Corbet smarted under the words 'audacious schoolboy,' although they were uttered so calmly that they seemed to be meant rather as a kindly reproof than as an expression of contempt. He controlled the passion which was threatening to master him, and answered with firmness and some degree of composure: 'If she does obey you, Mr Edwards, it will be under the influence of your enforced authority; and I refuse beforehand to be bound by any constraint you may exercise upon her. I shall not release her from the pledge she has given to me until she herself asks me to do so.'

'Very well; she shall ask you.'

'But I shall have to be satisfied that she asks of her own free-will, and not under compulsion.'

'I see that it is useless to attempt to reason with you, Corbet; and as you are resolved to ignore me in this business, I must adopt what measures may be in my power to prevent you from seeing or corresponding with her.'

'You will fail.'

'Well,' answered Mr Edwards with a faint smile at this defiance, 'it is said that love laughs at locksmiths; but it does not always prove strong enough to overthrow the sense of duty to which I mean to appeal.—Good-bye; and I am sorry that you and I must cease to be even acquaintances.'

'So be it,' rejoined Corbet in his strong clear voice.—'Good-bye.' He walked swiftly away; and Mr Edwards, with both hands resting on the handle of his heavy staff, stood looking after him. There was no anger in the expression of his face, despite the young man's bold defiance of all that a father regards as his natural authority. Regret and doubt were the feelings which disturbed his mind—regret that he should have been obliged to quarrel with this impetuous and not too civil young man, of whose abilities he had formed a high estimate; and doubt lest he should not be taking the best course to assure his daughter's happiness. Since he desired that above all things, why should he not surrender to the wishes of the lovers, and let them take their chance of finding out whether or not they had blundered in opposing his experienced counsel?

To his relief came the cynical reflection, that if he did yield to them, Corbet would speedily discover how he had hampered himself by marrying at the threshold of his career; and she, perceiving how much more successful he might have been if he had been free, would be miserable.

That must not be; and the place of this gloomy vision was taken by one of Lizzie as Lady Wigan of Foxmoor, lifted at once into a high place in the ranks of the aristocracy—for the baronetcy of Foxmoor was one of the oldest in England, and esteemed above any modern earldom. Lizzie was a girl of spirit, he felt sure, and would speedily come to appreciate the position his wealth had provided for her, while she would find in Sir Joshua a faithful and attached husband.

What nonsense for him to hesitate: he had decided aright, and he would not commit such an egregious act of folly as he would do if he were to thrust aside his own judgment and experience for a girl's fancy. He turned, and walked thoughtfully across the park. On entering the house, he sent for Lizzie; and she found him in the library, standing with hands clasped behind him, gazing out at the window. He was so absorbed that he did not hear her approach, and she remained for a few moments timidly waiting for him to speak. At length: 'Papa, you sent for me,' she said in her soft voice.

He started, and wheeled round as if he had been frightened by something. His face was pale, and bore the expression of one who has been suddenly roused from a painful dream. The thought which was torturing him took the form of a question iterated and reiterated by mysterious voices in his brain with a monotonous cadence that worried him and defied all his efforts to silence it. 'Am I in the right? Or will this be another act of betrayal which will drive me to madness?'

These words were still ringing in his ears, when he spoke to her in a somewhat dazed fashion: 'Yes, yes; I want to speak to you, Lizzie. Sit down. We must try to be very cool, for what I have to say will affect your whole life, and mine also. Come over to the sunshine.' He pointed to a chair in the window recess, whilst he sank on one opposite, passing his hand over his eyes, as if to clear away a mist. A bright sunbeam passed like a golden bar between them.

#### THE FLOWERS AND PERFUMES OF SOUTHERN FRANCE.

FOR nearly a century the culture of flowers on a large commercial scale, and the manufacture of perfumes and essences, have formed a special and lucrative industry in the south of France. The principal part of this dainty manufacture is at Grasse, in the department of the Maritime Alps; but it is also conducted on a more or less extensive scale at Sommières, Nîmes, Nyons, Seillans, and other neighbouring points. As the business is largely extending, and the exports of perfumes are increasing, the American consul at Marseilles has visited the districts, and has sent home an interesting Report to his government. In this, the subject is naturally divided into two branches—the first dealing with the culture of flowers and blossoms; and the second, the manufacture therefrom of the pomades, essences, and perfumed waters of commerce.

The kinds of flowers principally grown, and their season of harvest, are the violet, jonquil,

and mignonette, which are usually gathered in February, March, and April; although in mild, moist winters the violets begin as early as December; roses and orange blossoms, with thyme and rosemary, in May and June; jasmynes and tuberoses in July and August; lavender and spikenard in September; and the acacia in October and November. The harvest of flowers covers, therefore, about three-fourths of the year; but the season of greatest activity is May and June, when the roses and orange blossoms are gathered. Thyme, rosemary, and lavender are among the minor products, grown principally in rural districts by grape and olive farmers, who have at home the simple apparatus required to distil the flowers, and who produce a more or less inferior class of essences, which are used to dilute and adulterate the superior essences produced at the larger establishments in towns and villages.

As the conditions of industrial success in flower-growing can be best studied by a specific example, the plantation belonging to Madame de Rostaing, at Seillans, in the department of Var, may be taken as a typical farm. It includes about twenty-three acres, located on the southern slope of the Maritime foot hills, about two thousand feet above the level of the Mediterranean, and about twenty miles from the coast. The calcareous soil was naturally thin and poor; and the olive trees which had occupied the ground for a century or more prior to 1881 yielded but scanty and unsatisfactory returns. The slope of the surface was so steep, that the waters of a spring which flows from the rocks above the tract could be but imperfectly utilised for irrigation, and the land was regarded as practically worthless. In 1881, the proprietress caused the olive trees to be removed and the land prepared for flower-culture. First, the ground was dug up to a depth of four feet, the larger stones removed, and built into sustaining walls for the terraces into which the surface was divided and levelled. Along the upper margin of each terrace, a shallow ditch was cut, connecting with transverse channels, which supply the spring-water for irrigation. The abruptness of the slope will be indicated by the fact that, on a tract of eighteen acres, the terrace walls required to produce a series of level or gently sloping surfaces, are two thousand one hundred and sixty-six yards in length. Thus terraced, the tract yielded seventeen and a half acres of prepared land for planting. In the autumn of 1881, forty-five thousand tufts of violets, and one hundred and forty thousand roots of the white jasmine, were planted; and in the following spring, the remainder of the ground was planted with roses, geraniums, tuberoses, and jonquils, and a laboratory erected for the manufacture of perfumes. The location proved to have been well chosen; the flower-plants grew vigorous and strong; and in 1885, the fourth year after planting, the farm which had previously yielded a rental of twenty-three pounds a year, produced perfumes of the value of £8630, and gave a net profit for the year of £1533, 16s. The difficult nature of the ground had made its preparation unusually laborious and expensive; but in this balance-sheet, the interest on the entire investment is included in the expense account, so that the profits as

stated appear to be clear and legitimate. Of course, the plants and shrubs at Seillans have not yet reached their full productive capacity; but the results of the fourth year illustrate sufficiently how lucrative flower-farming may become in favourable locations and under good management.

From the observations made on this and many other farms where perfume-flower-growing is the leading branch of agriculture, it is clear that there are certain conditions essential to success. The first is an altitude of from five hundred to two thousand feet, as flowers grown on such high locations are said to be far more rich in perfume than similar varieties which bloom in valleys and lowlands. The next condition is a soil rich in calcareous elements. Thirdly, the situation should be sheltered from cold northern winds, and not subject to the white frosts which, in spring and autumn, affect the damp lowlands. In countries like Southern France, where the rainfall is always scanty, and often wanting entirely from May to September, irrigation is essential also; but no doubt there are spots with sufficient humidity where this could be dispensed with.

One essential principle in perfume-culture is, that all fancy and 'improved' varieties of flowers are discarded, and the natural, simple, old-fashioned kind are exclusively grown. The roses grown are the common pink ones; the single wild violet is preferred to all the larger artificially developed varieties; and not a double tuberose is to be seen on any farm. Only the white jasmine is used, the yellow and less fragrant variety being either discarded or unknown. The jasmine plants are set in rows about ten inches apart, and are closely pruned every year. Roses are grown on the lower terraces, and are likewise cut low, and the ground between the trees heavily manured. After the roses have been gathered, the stem is cut to within a few inches of the ground, so as to conserve for the next season the entire vigour of the plant.

During the harvest season, traders, or middlemen, go through the country every day with wagons collecting flowers from the farms, for which they pay prices varying according to the extent of the crop and the demands of the market. Their fragrant load is hurried to the nearest manufacturer, and delivered while the flowers are still fresh and crisp. It is necessary that the flowers should be gathered in the morning as soon as possible after the dews of the preceding night have disappeared. In many cases, laboratories are erected on the flower-farm itself; and if the farm is of sufficient size, this adds very much to the profits.

This brings us to the subject of the manufacture of perfumes, which includes the making of 'pomades' and oils by the process of absorption, and of essences and essential oils by distillation. Every complete establishment is equipped with apparatus for all these processes.

Pomades are the commercial vehicle for absorbing and transporting the perfumes of the jonquil, tuberose, jasmine, and a few other species of flowers. A square frame, or *chassis*, of white wood, about twenty inches by thirty inches in size, is set with a pane of strong plate-glass. On each side of the glass is spread a thin, even layer

of grease, which has been purified and refined. Thus prepared, the frames are piled up in ranks six or seven feet high, to await the season of each special flower. When the blossoms arrive, the petals are picked from the stem—the pistils and stamens being discarded—and laid so as to cover the grease in each frame. These being again piled so as to rest upon their wooden edges, which fit closely together, there is formed a series of tight chambers, the floors and ceilings of which are of grease, exposed to the perfume of the flower-leaves within. The grease absorbs the perfume; the spent flowers are removed daily, and fresh ones supplied; and this process goes on from two to four or five months, according to the desired strength of the pomade, which, when sufficiently charged with perfume, is taken from the glass with a wide thin spatula, and packed in tin cans for export. By these methods, the delicate odours of flowers are extracted and retained for transport to distant markets, where, being treated with alcohol, they yield their perfume to that stronger vehicle, and produce the floral waters and extracts of commerce. Coarser pomades are made by boiling the flowers in the grease and subjecting the residue to pressure. The spent pomades are used for toilet purposes and in the manufacture of fine soaps.

The process of preparing perfumed oils involves the same principle, except that, instead of solid grease, superfine olive oil is used. With this oil, pieces of coarse cotton fabric are saturated, which are then spread upon wire-netting stretched in wooden frames about three feet by four feet in size. The flowers are spread upon the saturated cloths, and the frames piled one above the other, so that the perfume of the flowers is absorbed as in the previous process.

Essences and 'flower-waters' are produced by ordinary distillation, in which the flowers are boiled with water in large alembics. The vapour carries off the perfume, and is condensed in adjoining copper tanks, like ordinary spirits. Some of the retorts used for this purpose are of sufficient size to receive at once half a ton of fresh flowers with the requisite water for their distillation. When 'flower-waters' are to be produced, alcohol is used in the distilling tank to receive the perfumes. By skillful combinations of the perfumes of different flowers, sometimes with the addition of chemicals, a large variety of handkerchief extracts, such as 'Patchouli,' 'Jockey Club,' 'West End,' &c., are produced.

All these details of manufacture require careful and skilful manipulation. A mild, uniform temperature is secured by the heavy stone buildings in which the process of absorption is conducted, and scrupulous cleanliness is required at every stage of the manufacture. After removing the pomades from the frames, the glass is removed and cleansed with alkalies, and the frames scraped to remove every vestige of grease, which, by becoming rancid, might spoil the product of the next operation. The work of the manufacturing is largely done by women, who earn from tenpence to one shilling for a day of ten hours. During the busy season of roses and orange-flowers, they earn half as much more by working until midnight, or later. Labourers on the flower-farms receive the ordinary low wages paid for agricultural labour in the district, as

there is nothing in the culture of the flowers that is beyond the skill and understanding of an ordinary farm-hand, when directed by an intelligent and experienced overseer.

## THE NEW RULE.

### A HOSPITAL COMEDY.

THE directors, governor, and matron of St Lazarus' Hospital had unanimously promulgated a new law—a wise and salutary enactment, it may be, but one of terrible import—namely, that every nurse who became 'engaged' to a student or doctor connected with the hospital should forthwith be dismissed.

There had been a good deal of love-making within the walls of St Lazarus. There usually is where young men and maidens have frequent occasion to meet each other; and even hardened and avowed celibates who could resist the fascinations of the loveliest girl in Europe when she was attired according to the dictates of fashion, and was bent on nothing but her own amusement, succumbed to a pretty 'sister' dressed in a dainty cap and simple gown, and engaged in tending the suffering. Several marriages had thus been arranged; and Mrs Saunders, the matron, who, being a widow herself, considered the marriage of any of her subordinates 'most un-nurse-like'—she was fond of this phrase, having invented it—felt it to be her duty to urge upon the governor the fitness of pressing upon the directors the necessity of putting a stop to all manner of courtship or flirtation.

'The amount of sentimental nonsense that goes on in the hospital is positively scandalous,' she said. 'I'm sure it isn't my fault; I do all I can to prevent it, and yet it goes on.'

Mrs Saunders did herself no more than justice. If any man in the place could look on a nurse without positive aversion, it was *not* her fault. She wished her nurses to be, she said, 'neat, but not attractive.' The bewitching fringe was strictly tabooed; and since it had come into fashion, the wearing of the hair short, adopted by several nurses, as being the simplest possible coiffure, had met with her entire disapproval. Unfortunately, she could not disfigure the noses and eyes of her 'sisters,' or she would certainly have done it.

She was held in unmitigated awe and modified esteem. The merest hint of her proximity was enough to make the most sentimental couple find pressing occupation at opposite ends of the corridor or ward in which they had met; and it was a great trial to her that, owing to her being a heavy dame, of ample person, who could not exactly dart into a ward like a sunbeam, she had never been an absolute eye-witness to any 'nonsense,' as she called it. She knew that love-making was going on around her; she felt it in the air; and yet she was never able to lay her finger on a tangible instance of it. Therefore, until her brain evolved the bright idea of turning betrothed renegades out of doors, she was very unhappy. Now, a calm sense of triumph brightened her usually austere and frowning brow.

The new regulation provoked some indignation among most of the nurses. Sister Fanny, indeed, said she didn't care; she didn't want to

get engaged to anybody, and the new rule did not forbid one's being—well, pleasant to—people. Sister Evelyn declared that she thought it just and necessary ('the goings-on were shameful,' she said); and Sister Phoebe remarked, with her brightest, merriest smile, that it would not affect her one bit. But all the others were wroth, and one probationer burst into tears, and threatened to leave the hospital without awaiting the contingent dismissal.

'You needn't be so frightened,' said Sister Evelyn. 'You're not likely to be sent away on account of *your* getting engaged. There won't be any occasion for it.'

'Perhaps not,' observed Phoebe in a musing tone; 'but I think Sister Evelyn is the most likely of any of us to escape even the suspicion of flirting.'

Sister Evelyn glared at the speaker, who looked as placidly unconscious as possible. Between the two there existed that comfortable spite, breaking out into occasional passages of arms, which is the very salt of life to women who lead a monotonous existence. At least it was the salt of life to Phoebe. Perhaps the other did not enjoy it so much, for, as a rule, she got the worst of these encounters of wits. She had at first hated Sister Phoebe merely on principle, because she was pretty; but these little battles, in which she was so often worsted, had made her regard her with a detestation beyond what she felt for any other good-looking girl in the place.

Sister Evelyn had begun life as Mary Anne Giles, and came from some unspecified part of the 'great unexplored East End.' It was said that she had brought thence some oriental habits of thought and speech; but this was matter of opinion. What is certain is that, when she joined a nursing sisterhood and gave up her surname, she threw her unromantic prænomen overboard as well, and appeared under the sentimental title by which we have spoken of her. This change of style leaking out at St Lazarus' had occasioned some amusement, which Sister Evelyn had resented so vigorously, that she was now the most unpopular nurse in the whole establishment. She was rather disgusted with nursing altogether, and was inclined to give it up, finding it harder and less congenial work than she had anticipated. And, besides, the hospital cap was unbecoming to her. But she got on well with Mrs Saunders—some of the others said she toadied to the matron—and so she stayed on.

Phoebe Chester, in hospital parlance Sister Phoebe, was, on the contrary, a universal favourite. She was the best surgical nurse in the place, so the doctors liked her. She had a pretty face—which the cap Sister Evelyn found so trying suited to perfection—and a neat figure, so the students and resident surgeons admired her. She had a winning smile, a soothing voice, and a noiseless step, so the patients adored her. There was a general feeling of deep regret when it was whispered that Phoebe was flirting with Dr Harrington, and that there was question of an inquiry into the matter, with a view to ascertaining if any engagement existed between them.

'It can't be true,' exclaimed Sister Fanny. 'Phoebe has always been as nice as possible to everybody; but she never took special notice

of any one of the doctors. It is only that spiteful cat's jealousy, because she is in Dr Harrington's ward, and he never looks at her.' (The 'spiteful cat' was Sister Evelyn.)

'But,' said the probationer who had hinted at the accusation, 'Dr Harrington is so pleasant and so handsome, that even Sister Phœbe might be different—to him. And I did see them on the stair together, and'—

'Well—what? Was there anything that looked like flirting?'

'I don't know if you would call it so'—for Sister Fanny was known to be broadly tolerant in the matter of civility, and did not apply the title of flirting to any but extreme cases. 'I don't know if you would call it so; but Sister Phœbe was talking to him very hurriedly and earnestly, and he looked very much pleased. Of course, I saw them long before I heard their voices; but as I came nearer the landing where they were, she gave him her hand and said: "Good-bye.—I suppose I must say 'doctor' still, as we are in the hospital; but on Sunday I'll call you Walter."'

'What did he say to that?'

'He stooped and—kissed her hand, saying: "Phœbe, you are the cleverest, as well as the dearest and prettiest little woman in the world!" She shook her head at that, and withdrew her hand. She was going away, when he asked her: "What about yourself?" She smiled, and touched the third finger of her left hand with the forefinger of the right. "I must not wear a ring," she said; "but it is shining on my soul's hand as bright and firm as ever." It did seem funny to hear Sister Phœbe, who always laughs at love-making, make such a sentimental speech as that.

'Yes, it is unlike her. It almost makes one think there is something between them. But I hope not. It would be terribly dull if Phœbe went; she always manages to make one see the bright side of things.'

'Can't you do anything, Sister Fanny?'

'I will warn her to be careful. But if she is really in love, it is sure to betray itself; and she is too honourable to deny the truth, if she really is engaged.'

The warning came too late to save Phœbe, for some such interview as the probationer had witnessed had been seen by Sister Evelyn, who had immediately reported it to the matron. Mrs Saunders, the 'Mother Superior,' as this most unmaternal of matrons liked to be entitled, went forth to investigate the matter. She had a short interview with Phœbe, unsatisfactory, save that she elicited the awful fact that she was engaged. She obstinately refused to tell the name of her lover.

'Not that your silence matters,' said Mrs Saunders; 'every one knows that it is Dr Harrington you have been going on with. Both you and he will have to see the governor to-morrow about this matter.' Then she dismissed the nurse.

Phœbe went out with her head meekly bent, as if she was thinking of the awfulness of her impending doom; but when she had closed the door, she tossed it up with a saucy smile and executed a most 'un-nurselike' pirouette. Then she produced from the pocket of her apron a pencil and note-book, and there, within three

yards of the condemning matron—such was her unparalleled audacity!—scribbled a note to Dr Harrington. This she intrusted to the senior probationer in his ward, who gave it to him next morning almost under Sister Evelyn's eyes.

That day, the two culprits were arraigned before the governor, Mrs Saunders accompanying Phœbe as accuser. Walter Harrington, who exchanged a glance of amused confidence with the Sister as she came in, was the first to be examined.

The governor, after repeating the new rule, and discoursing for a minute or two on the necessity for it, asked: 'Dr Harrington, have you entered into a matrimonial engagement?'

'Really,' said Harrington, 'I can hardly say. I think I have; but—may I ask you the day of the month?'

'What do you mean?' asked the governor. 'Are you mad?'

'I hope not. I assure you that the information I ask for is essential to my answering your question.'

'It is the 20th of May.'

'Then—I am engaged.'

'To Miss Chester?' The governor alluded to Sister Phœbe; but he was very old-fashioned, and could not acquire the habit of calling the nurses Sister This or That. He spoke of them as he would of any other young ladies.

'To Miss Chester,' repeated Harrington.

'May I ask when this engagement began?'

'Certainly. It began to-day.'

'To-day!' repeated the governor in some surprise.—'Perhaps, Mrs Saunders, we have been unduly prompt. Doubtless, Dr Harrington and Miss Chester would have announced their engagement in proper form, and have volunteered their resignations.'

'I had no intention of resigning,' remarked the young doctor.

'But the law'—

'The law does not affect me.'

The governor was about to rebuke severely this indifference to rules and regulations, when Mrs Saunders interposed. 'I don't want to cast any doubt on Dr Harrington's truthfulness,' she observed acridly; 'but Sister Phœbe confessed to her engagement yesterday, which does not exactly corroborate his statement.'

'It certainly does not.'

'I think,' said the matron, 'that Dr Harrington is concealing the truth, in order to hide his disobedience with regard to the new law.'

'Dear, dear; that is very shocking!' said the governor, getting bewildered at the new accusation; while Dr Harrington bowed, and expressed his obligation to Mrs Saunders for the high esteem in which she held him.

The matron turned her back on him, and said to the governor: 'You had better question Sister Phœbe. You will at least get the truth from her. Girls are too proud of being engaged to deny it.'

The governor turned to Phœbe, prepared to act the part of stern upholder of authority; but her face looked so meekly bewitching, that his heart softened within him; and he remembered that he had daughters of his own, who liked to have lovers as much as any other girls.

'Well, well, Miss Chester, this is very sad,'

he began rather vaguely. 'Of course it is quite natural and right, and no one could expect you to remain unmarried all your life; but law is law, and must be obeyed. Otherwise, I would suggest—and even as it is, perhaps'—He was actually about to propose making an exception in Phoebe's favour, when he felt Mrs Saunders' cold hard eye freezing him to the bone. He coughed, dropped his preamble, and proceeded to catechise, though in an apologetic and paternal tone, which the matron disapproved of. 'Now, do you mind telling me, my dear, how long you have been engaged?'

Phoebe blushed a little, and looked down, but answered quite clearly: 'A long time—nearly two years.'

'But Dr Harrington says his engagement began only to-day.'

'Yes; that is quite true.'

'But, my dear girl, it takes two people to make an engagement as well as a quarrel. If you have been engaged to Dr Harrington for two years, he must have been engaged to you for the same time.'

'Oh, I see!' Phoebe smiled as if a new light began to dawn upon her. 'But I am not engaged to Dr Harrington.'

'Why, he said you were.'

'Excuse me, I did not,' said Harrington. 'I am engaged to Miss Chester—not to Miss Phoebe Chester, whom I should have called Sister Phoebe, as every one in the hospital does; but to her cousin, Miss Elsie Chester. Mr Thorpe, Elsie's uncle and next of kin, would not consent to her promising to marry a man who had his fortune to make; and as she was a ward in Chancery, there could be no tie between us till she came of age and was free to act for herself. This is her twenty-first birthday, and I may now look upon myself as her future husband; for, though there has been no communication between us for a year, Sister Phoebe—who has been very kind in telling me all her cousin says and does—said to me two days ago that Elsie had declared her intention of accepting me if I offered myself after she reached her majority. She would receive my proposal this morning. I expect her reply, which I think I may assume will be favourable, by the afternoon post.'

Mrs Saunders looked indignant at this explanation. If it were not discourteous, one might say that she sniffed at it, as if dubious of its accuracy; but Harrington caught sight of a gleam of sympathetic humour in the governor's eye, as he turned to Sister Phoebe with the query: 'Well, Miss Phoebe, and what is the truth—the real truth—about your love-affair?'

'It's a very hopeless one,' she said with a little sigh. 'I am engaged to my cousin Jack, Mr Thorpe's son. Uncle Thorpe doesn't approve of the match, because I am poor and have to work for my living. Jack has gone out to Rio Janeiro, because he is likely to get on better there; and as soon as his income is large enough to justify our marrying, he is going to send for me. That's all. I would willingly have told the Mother Superior all about it, if she had asked me as a friend; but I do not feel bound to confide my poor little romance to people whom I know to be unsympathetic. It isn't in any way opposed to the rules of the hospital.'

'No, no; of course not,' answered the governor good-naturedly. 'And though I am sure we shall all be sorry to part with you, when your Jack claims you, I hope for your sake that it won't be long.—Now, go away to your work, both of you, and—next time you are not breaking a rule, don't behave as if you were.'

Phoebe and Harrington left the room. Mrs Saunders remained.

'Well, they've got the best of it,' said the governor, chuckling a little at the matron's evident discomfiture. 'Your sp—I mean, informant—has been too hasty in jumping to conclusions. She must have a better authenticated case next time.'

'My opinion is,' said Mrs Saunders, not deigning to answer these remarks, 'that any promise of marriage should entail dismissal from the hospital, even though both the contracting parties do not belong to its staff.'

'I don't know how that would work,' replied her companion. 'You see, if the intent to commit matrimony be criminal, the commission of it must be much worse, and would certainly deserve a punishment no less severe, which would entail every one of the honorary surgeons, and myself, and even you, being turned out of our comfortable berths, and thrown out on the world, which I at least should consider inconvenient. I think, on the contrary, that the wiser plan would be to rescind the new rule.'

And the new rule was rescinded, or was at least allowed to fall into honoured desuetude. Walter Harrington left the hospital, and married his Elsie soon after the little misunderstanding recorded above; but Sister Phoebe brightened the wards of St Lazarus' with her presence for a year longer. When, however, she left to become the wife of Jack Thorpe, no one expressed more satisfaction than Mrs Saunders, though I fear this was from anything but good-will towards the bride.

## OCCASIONAL NOTES.

### AN ENORMOUS FARM.

ALMOST contemporaneously with the news of the collapse of the famous Bell Farm in the Canadian north-western provinces, we have an account of another, which is not only the largest producing farm in the world, but which throws all other large farms quite into the shade. It is situated in the extreme south-west corner of Louisiana, runs one hundred miles north and south, and many miles east and west. The tract of land embraced in the farm is a million and a half acres in extent, and was purchased from the State and from the government in 1883. This immense tract of land was at once divided into convenient pastures, ranches on stations being established every six miles. The fencing alone cost about ten thousand pounds. The land was found best adapted for rice, sugar, maize, and cotton; and all the cultivation for these crops is done by steam-power. A tract of about half a mile wide is taken, and on each side a portable engine is placed, these driving a cable attached to four ploughs. In this way thirty acres a day are said to be ploughed with the labour of three men only. Harrowing, planting, and other cultivation are done in the same way; and the

manager declares that 'there is not a single draught-horse on the entire place.' There are, of course, horses for the herders of cattle, of which there are sixteen thousand head on the farm. The Southern Pacific Railroad runs for thirty-six miles through the farm; and three steamboats are operating on the rivers of the estate, upon which there are three hundred miles of navigable waters. The farm contains also an icehouse, a bank, a shipyard, and a ricemill.

#### A SHIP-CANAL FOR INDIA.

A remarkable scheme, and one of considerable importance to the commercial interests of our Indian empire, has just received the approval of Sir John Cooke, the eminent engineer who constructed the Breakwater at Portland Isle, in Dorsetshire, thereby converting the Portland Roads into one of the finest harbours of refuge on our coasts. The scheme will be readily understood if we refer our readers to the map of Ceylon, by glancing at which it will be observed that between the north point of Ceylon and the south-eastern termination of India is the island of Ramasserim, separated from the Indian coast by a very narrow water-way, kept permeable at a great expense by the Madras government, and yet only available for small coasters. Large steamers and sailing-ships proceeding to Madras or Calcutta are obliged to go all round by the southern point of Ceylon, and then sail direct north for Calcutta or the Bay of Bengal, involving a voyage of many hundred miles, and the loss of much valuable time. It has, in consequence, been proposed to cut a broad and deep ship-canal through the island Ramasserim, and thus open the way to Palk Strait and the Coromandel Coast, obviating the necessity of the long Ceylon route. There are plenty of reasons why the Indian government, as well as the executive of Madras, should support and patronise the scheme, for the latter government would thus be freed from the obligation to keep up the unsatisfactory and very small water-way at present existing. It is understood that all the southern railways are favourable to the proposal. If the canal is ultimately carried out, it is more than possible that it would lead to the establishing of a large canal port on the mainland, whence railway communication might readily be established with the interior. By means of such a railway and the proposed canal, the voyage round Ceylon would be avoided; cargoes would be at once landed at the canal port, and despatched immediately to the interior by railway, and a prodigious amount of valuable time would be saved. This is an important factor in all commercial enterprises; and any scheme to promote the saving of it, in the interests of commerce, will surely never fail to find warm supporters amongst the merchants of Europe and of India, as also of all others who are in any way connected with the trade interests of our great Indian empire.

#### THE PROTECTION OF LIFE AND PROPERTY FROM LIGHTNING.

Persons who have suffered in mind or estate from lightning will be glad to hear about a proposed alleviation of their troubles. Mr W.

McGregor, late chief superintendent of the government telegraphs, Assam, as interim secretary of a proposed new Society for the protection of life and property from lightning, has issued a summary of the objects and rules of the Society. These include an examination of the plans of buildings in reference to chimneys, steeples, towers, metal-work employed, with regard to the means provided for safety against lightning. The periodical inspection of lightning-conductors; the reporting on lightning disasters on behalf of insurance companies or occupiers of property. In some cases, a mere telegraph wire would be a sufficient protection; in others, by utilising and electrically connecting ordinary iron rain-water pipes, eaves, &c., with iron rods, and proper earth connections, the first cost would be reduced, and the building rendered safe. Another feature of the Society would be the collection and collation of information as to lightning disasters; while an officer of the Society might be deputed to travel and lecture throughout the country on the subject. Full particulars as to this scheme may be had from the projector of this Society, W. McGregor, Kohima Lodge, Bedford.

#### LOVE'S EXCHANGES.

You praise my beauty, grace, and art,  
O Love; but you are much to blame;  
In every line you leave a smart,  
That makes me bow my head in shame.

Whate'er the world may choose to say,  
I look not for such words from you;  
I'd throw them from my heart away,  
If you could even prove them true.

World's praise is but a passing mood,  
That shifts about with the occasion;  
It serves as oft for envy's food,  
As that of honest admiration.

In your regard, I set no store  
On what, by way of form or feature,  
I hold in common, less or more,  
With every other human creature.

If Love be blind, as it is said,  
What can he know of outward graces?  
I care not for the love that's led  
A facile slave of pretty faces.

I would not have my love depend  
On beauty, were I ten times fairer.  
If beauty knew no change or end,  
Life asks for something deeper, rarer—

Something that sets the world aside,  
Beyond the touch of time or season.  
If only love for love abide,  
I do not want another reason.

## A POWER OF THE AIR.

IN these latter days, with all our scientific knowledge and mechanical appliances, it is wonderful how little we really know about some of the familiar forces that unseen surround us. Of all things in nature, electricity is perhaps the most mysterious. It is true the laws that regulate its action under certain conditions are now tolerably well known—it can be collected, controlled, directed. It has been tamed, so to speak, and systematically trained to perform useful services to commerce and society. Yet we are nearly as ignorant of its real nature and essence as were the ancient dwellers in Magnesia, who are said to have discovered a wonderful kind of stony earth that persistently adhered to their iron-shod crooks. One of the greatest of living scientists has said that to the question, What is electricity? he can only reply, that he does not know.

Within us and around us, permeating all matter, this force, or fluid, or whatever name may be applied to it, is ever present—not stationary or in fixed quantity, but continually varying, and restless as the waves of the sea. Although the ebb and flow of the electric tides may be said never to cease, we are usually altogether unconscious of their movements or their existence. It is only at times of unusual electrical commotion that they become perceptible to the senses, as, for instance, when the aurora is visible in the heavens, when St Elmo's fires are glowing, or during a thunder-storm. That the aurora is electrical in its character there can be no doubt, as its appearance is almost invariably coincident with violent terrestrial disturbances. A brilliant display of aurora is indeed a beautiful sight, which may well excite our admiration and wonder. Streamers, and belts, and waves of light seem to shoot upwards from the northern sky, now advancing, now receding; ever changing, and yet defying you to trace the changes as they occur. Glowing and waning, and glowing again; leaping and darting like a flame, they execute their merry dance—frequently to a curious crackling music of their own—and

'flit ere you can point their place.' The colour of the aurora varies according to altitude, from white to violet or red—white being most common. In more superstitious times, a display of red aurora was invariably interpreted as an omen of approaching war.

St Elmo's fire is a peculiar but, at sea, not unfamiliar phenomenon; and although it chiefly occurs during thunder-storms, it is itself in no way dangerous. It always appears at the apex of lofty tapering objects, resembling a flame of fire rising out of them. It may sometimes be seen at the tops of trees, but more frequently on the masts or yardarms of ships at sea. It is nothing more than a harmless discharge of electricity.

But atmospheric electricity assumes its most impressive aspect when it appears in the lightning flash. An earthquake excites only a feeling of terror; but while a thunder-storm has its terrors, it has also its fascinations. When 'heaven's artillery' plays, we cannot but be impressed with a sense of our own littleness and helplessness, and touched with a feeling of fear. Yet there is so much that is sublime and majestic in the roll of the thunder and the gleam of the lightning, that we are fascinated, and constrained to watch and listen with awe and reverence. We feel that we stand in the presence of a power with which we cannot cope, a power irresistible, and apparently without guidance or control. The next flash may deal our deathblow; yet this thought is not generally uppermost. Many people, it is true, have a terror of lightning, but the feeling often results quite as much from physical as from mental causes; that is to say, it is due not more to an intellectual apprehension of impending danger than to an excited nervous system, consequent on the electrified condition of the atmosphere. There are many persons whose nervous systems seem to suffer complete collapse during a thunder-storm. At times of electrical disturbance, even when unaccompanied by any visible sign or audible sound, they are agitated and uneasy. Some individuals are able to tell when such a disturbance is in progress, although

others may be quite oblivious of it; and if the lightning actually begins to play, they exhibit the most acute signs of distress. In a building exceptionally well provided with lightning-protectors, we have reasoned to no purpose with such individuals, on the occasion of a thunder-storm. It is not fear, they say, that agitates them; they cannot account for the feeling—they simply 'cannot help it.' The subject of the influence of atmospheric electricity on the human system is one that will bear further investigation from scientists.

There are three kinds of lightning—forked or zigzag lightning, sheet-lightning, and globular lightning. The sky generally gives timely warning of the outbreak of a thunder-storm. Heavy masses of singularly opaque cumulus and cirro-stratus cloud are formed, from which rain falls—or it may be hail. Lightning is a discharge of electricity between two clouds, or between clouds and the earth. Fortunately for us, most of the lightning passes from cloud to cloud. When one body becomes more highly charged with electricity than another in its vicinity, there is a tendency to transfer part of its charge to that other body, so as to establish neutrality. The greater the difference between the charges in the two bodies, the greater the strain or tension. This tension is technically called the 'potential.' Usually, the air is positively electrified; but during a thunder-storm the signs (positive and negative) as well as the potential are continually changing. Before a discharge of lightning takes place, a potential inconceivably great is established. We are all familiar with the sight of telegraph wires: this country and Europe generally are covered with them as with a network. Each of these wires requires from ten to a hundred battery-cells to flash the telegraphic signals. Yet there is not in all Europe sufficient battery-power to make a respectable flash of lightning—say, a couple of miles in length, while some flashes extend to ten miles in length, or more. Nothing can stand before lightning. It deals destruction to every opposing object in its path, striking down the most solid masonry, shrivelling up the sturdiest trees, and melting the hardest rock. But, like everything in nature, it has its uses—relieving the overcharged clouds, restoring the disturbed equilibrium, so to speak, and purifying the air. But how is it that the thunder-cloud is charged with such enormous electrical energy? The phenomenon is due to great differences of temperature in neighbouring masses of air; or sometimes, as in winter, to violent cyclonic disturbances. Condensation of the aqueous vapour then taking place, electricity is developed on the molecules of water. Each molecule has a definite potential. As the molecules coalesce, the potential increases; and as a single drop of water contains billions of molecules, it is not difficult to understand how the potential of a thunder-cloud should be so transcendently great. A cloud highly charged with electricity, either positive or negative, electrifies by induction the ground

beneath, or the neighbouring clouds, causing electricity of the opposite sign to be there accumulated. A high potential is thus established. The electricity of the one sign strives to unite with its opposite. Under certain conditions, the union may be effected quietly and harmlessly; under others, with startling accompaniments. The discharge may take place gradually and without observation through lofty objects, such as trees or steeples. But if the potential is high, and these objects do not provide an adequate passage, the result is a lightning flash. The electrical tension is thus reduced or destroyed. A peculiar effect, known as the return shock, often accompanies the sudden combination of the two electricities. The instantaneous change from a highly electrified to a neutral state causes a violent concussion—not to be confounded with the lightning-stroke itself—which is often dangerous, and sometimes even proves fatal.

As is well known, electricity has a tendency to collect at points, and to spring towards points. This characteristic, which it fortunately possesses, serves a useful purpose, as, by taking advantage of it, important buildings are protected from lightning. When the earth is highly charged, the electricity collects at the extremities of the protectors and passes off into the atmosphere. These protectors not only ward off the destructive effects of lightning, but they act in some measure as a preventive of lightning itself. It is even conceivable that, were the ground covered with lightning-protectors in sufficient numbers and of sufficient height, no lightning would ever pass between the clouds and the earth. We have not yet, however, arrived—nor perhaps ever shall arrive—at such a desirable condition of immunity from this danger. The position of greatest peril from lightning is under isolated, unprotected objects, such as trees, though a position *from* the tree, at a distance of the height of the tree, is considered safe. It is not desirable to sit before a fire in a room during a thunder-storm, the soot and the heated air in the chimney acting as conductors. Generally speaking, there is perhaps less danger from lightning in towns than elsewhere, the numerous protectors erected on chimney stalks and church steeples providing some measure of safety. A lightning-conductor affords protection to a space around the diameter of which is four times its height. But great care is necessary in erecting such conductors: they must be continuous; that is to say, they must have no bad joints. It is also essential they should have proper connection with the earth; merely dipping the wires into the ground will not do. Underground water-mains make good earth-connections. Where these are not available, an earth-plate of sheet-copper, three feet by three feet, and an eighth of an inch thick, should be buried in wet earth, surrounded with coke. But no work of this description should be undertaken without skilled supervision.

An amusing story, illustrative of the futility of using a bad earth-connection, is told of a telegraph official of limited experience, who was instructed to put a wire to earth for testing purposes. The test showing an unlooked-for result, inquiries were instituted, when it was found that the zealous official had stuck the end of the wire into a flower-pot! But in reality the danger from

lightning is not so great as is generally supposed; not more than one human being out of two million is annually killed by it, a proportion which is small as compared with that of fatalities resulting from accidents on the streets of our large cities.

Every one is familiar with the fact that lightning does not spring *direct* from cloud to cloud, or to the earth, but pursues a zigzag course. This is due to the fact that the air is not equally humid throughout. Electricity always takes the path which offers least resistance to its passage. Damp air is a better conducting medium than dry air; consequently, the lightning selects the dampest route, avoiding the drier strata and zones it encounters, and advances, now directly, now obliquely, until it reaches the opposite cloud, where it subdivides into a number of forks. Owing to the resistance it encounters in its path, intense heat is generated, which causes the air to expand. Immediately after the flash, the air again contracts with great violence and with a loud report, which is echoed and re-echoed among the clouds. The report reaching the ear of the listener from varying distances, is drawn out into a series, and, being still further prolonged by the echoes, the roll of the thunder is produced. It is a curious fact that, although the sound of thunder is exceedingly loud when heard near at hand, the area over which it is audible is comparatively circumscribed. The noise of a cannonade will be heard, under favourable conditions, at a distance of nearly a hundred miles, while the sound of thunder does not travel over fifteen miles. The occurrence of the thunder and the lightning is, of course, simultaneous; but as light travels faster than sound—its passage is practically instantaneous—the flash may be seen several seconds before the thunder is heard. The distance of thunder may thus be approximately estimated, an interval of five seconds between the flash and the thunder-clap being allowed to the mile.

Sheet-lightning has the appearance of a sheet of flame momentarily illuminating part of the sky or cloud-surface. It is, in reality, but the reflection of lightning flashing beyond the horizon or behind the clouds, and at too great a distance for the thunder to be audible.

But the most remarkable of all the manifestations of electricity is globular lightning, in appearance like a ball of fire moving leisurely along, and remaining visible, it may be, several minutes. Many curious accounts are related of its vagaries. One of the most interesting and circumstantial is that given by Mr Fitzgerald, County Donegal, Ireland, who saw a globe of fire slowly descend from the Glendowan Mountains to the valleys below. Where it first touched the ground, it excavated a hole about twenty feet square, 'as if it had been cut out with a huge knife.' This was scarcely the work of a minute. For a distance of twenty perches it ploughed a trench about four feet deep, and, moving along the bank of a stream, it made a furrow a foot in depth. Finally, it tore away part of the bank five perches in length and five feet deep, and 'hurling the immense mass into the bed of the stream, it flew into the opposite peaty bank.' The globe was visible twenty minutes, and traversed a distance of a mile, showing that its progress was, for lightning, very slow indeed.

During thunder-storms of extreme violence on Deeside, balls of fire are occasionally seen to roll down the sides of Lochnagar, which are no doubt identical with globular lightning.

## RICHARD CABLE,

THE LIGHTSHIPMAN.

### CHAPTER XXV.—LAVENDER.

WHEN Josephine reached her own room, she threw herself into an armchair and said imperiously: 'Pack my things. I will point out what I want.'

Cable, instead of obeying, stood before her with his head bent, his grave eyes fixed on her face. His brow was lined. Had there been these furrows there before his marriage? Josephine had not observed them previously.

'What is the meaning of this?' he asked.

'Take your hands out of your pockets when addressing me,' she said, and fanned her hot face with her pocket-handkerchief.

He obeyed, and folded his arms. 'I do not understand what this means,' he said.

'Indeed?'—spoken contemptuously.

'Why do you object to my going with you to the lady's house, Josephine?'

'I will trouble you,' she said with voice shaking with anger—'I will trouble you to call me by my proper name. I am not Jöss-ephine, as you are pleased to designate me. The patriarch is not, I believe, by the most illiterate entitled Jöss-eph, and I object to be called other than Josephine.'

He looked at her with distressed expression on his face. 'He did not think there was anything wrong'—he began, and drew his kerchief from his pocket.

Then she stamped with her feet together impatiently on the floor. 'For heaven's sake,' she exclaimed, 'put away that detestable spotted blue pocket-handkerchief, as big as a sail! It is vulgar, it is odious. I hate the sight of it. It turns me faint. Give it to Jane for a duster.' She was in that condition of irritation when every trifle exasperates.—'Please, open the window,' she went on. 'I am suffocating. Your boots have been greased at sea with rancid tallow; they will not take the blacking, and—they are insufferable.'

He went to the window, unhasped the casement, and threw it wide, then stood, looking out. He drew a long breath, inhaling the sea-air, fresh and free, that rushed in, and fluttered the gauze valance of the dressing-table.

'You are right,' he said huskily; 'it is close in here. One can hardly breathe at all here—not in this room only, but in the parlour and the hall, on the terrace, in the garden, everywhere within the garden walls.'

In the window hung a brass cage that contained a bullfinch. Richard put his hand to the cage-door, unfastened it, and put in his hand.

'What are you about, Richard?' asked Josephine petulantly. 'Why do you not go on with the packing?'

He did not answer. The imprisoned bird had hopped on his finger. He drew his hand from the cage so steadily that the bullfinch did not

attempt to leave his perch. Then he put his arm out of the window, and the bird remained, turning its head about and uttering an astonished or pleased cheep!

'What are you doing!' cried Josephine, and started to her feet. Her call, or the vibration, alarmed the little bird; it spread its wings and flew away. 'What have you done!' burst forth Josephine, throwing herself again into her chair. 'My Puffles! my poor Puffles!'

'The room was close, and the bird could not breathe,' said Richard. 'I felt for the poor little wretch—a sort of fellow-feeling, I suppose.'

'Richard!' she said, half crying, 'this is too unkind, too cruel of you! You knew that I was fond of the bird; that is why you have deprived me of him. I will never, never forgive you.' Then the tears came into her eyes—not tears of sorrow for the loss of her pet, but of mortified pride and of angry resentment. Her flushed face, her pouting lips, her swollen muscles, all proclaimed wrath, not grief. 'I wish,' she muttered—'I wish that we had never—'

'What do you wish?' he asked, facing her.

'I wish'—— But she checked herself. Then, thinking that his feet touched her skirts, she brushed the latter away and tucked them under her knees, with passionate scorn in her action. 'Please, proceed with the packing. Lady Brentwood (*M'am*, as you call her) is not to be kept waiting an eternity, whilst you torment me with letting my pets loose. The horses have to be considered as well as she.'

'When do you return? To-morrow?'

'I do not know. I do not care if I stay a week to be free of my troubles.'

'What troubles?'

'O—troubles I have brought on myself—troubles past your comprehension.'

He said no more, but got out her box, and began to pack. Whilst he was thus engaged, he brooded on her words, and said: 'I think I understand you.'

'I usually speak so as to be understood,' she replied.

'Josephine,' said he, 'why will you not allow me to go with you? I know very well that I am no company for grand folks. I'm like a plain horn-handled steel fork that has lost its way, and got among the silver in the plate-basket. God knows, I do not desire to push myself where I am not wanted; but the lady did wish to have me.'

Josephine laughed contemptuously. 'Absurd! She did not want you, except as Samson, to make sport before the Philistines.'

'I do not believe you. The world is not so bad as you suppose.'

'Lady Brentwood was not sincere; she was laughing at you all the time she spoke with us.'

He shook his head. 'She's got a kind face and a kind way, and I don't think so bad of her as that. As for the Lords and Admirals! I'm not afraid of them. Men, be they ever so high, always know the wally of a true man.'

'Wally!' groaned Josephine. Then in a tone of bitter mockery she said rapidly: 'O generation of wipers! Pass the winegar.'

'What do you mean?' he asked, rising from her box on which he was engaged, and standing before her, with his face red, the veins in

his forehead distended and purple. 'Are you laughing at me? Scoffing at me, Josephine?'

'I merely repeat things I have heard.'

'When—where?'

'Oh, the other day I overheard you teaching the children a text from Scripture that began, O generation of vipers.'

'Well—I did not pronounce a word right, and so you scorn me? Is that about it?'

She shrugged her shoulders and made no reply. Her heart was beating furiously. She linked one foot behind the other and kicked the footstool from her.

'The Lord's own words,' said Richard sternly.

'Even they aren't sacred to you, not when a father is teaching them to his little ones. What odds if the pronunciation of the words be wrong, so long as the words themselves be right?'

He knelt again at her box and finished packing.

When he had done, she stood up. The sting of self-reproach made itself felt in her heart; but she was too proud to acknowledge that she had been in the wrong.

'Richard,' she said, 'you may go. Ring the bell to have the box taken down. I must dress myself hastily.'

When she descended the stairs a few minutes later, she looked about for him, but did not see him. He was not in the hall, nor in the drawing-room. As she got into the carriage, her eyes wandered in search of him; but he was not to be seen.

'Where is Richard?' she asked of her father.

He answered superciliously: 'He went loafing through the garden a minute ago.'

She settled herself beside Lady Brentwood.

'My dear,' said the latter, 'I am positive that lavender will thrive here.'

'What do you mean?'

'Do you not know? Where the wife rules, there the lavender flourishes.'

#### CHAPTER XXVI.—MOSQUITO STINGS.

When Richard left the house, he did not go to the cottage or to the yacht. He passed through the gate to the seawall, and stood outside the palisade of the garden, leaning against it, overshadowed by the boughs and fragrant flowers of a lime, looking out to sea. He could catch a glimpse of the drive; and as he heard the grind of the carriage-wheels on the gravel, he turned and looked, and saw Josephine depart with Lady Brentwood. Mr Cornellis was also in the carriage. So, as he, Richard, was not suffered to go, Lady Brentwood had carried off Mr Cornellis. In the opinion of Josephine, her father was suited to move in good society, to entertain Lords of the Admiralty; but her husband was not; he must be kept in the background, lest he should make himself ridiculous.

For the first time in his life, Richard's bright and crystalline humour clouded. Perhaps he had caught the infection from his wife. He tried to look up into the deep sky, but his cap did not shade his eyes; the brilliancy of the light dazzled him; besides, his eyes were burning. He rested them gloomily on the tufts of sovereign-wood and sea-spinach that sprouted between the stones at his feet. He had controlled himself before Josephine with an effort; now his chafed temper

swelled and tossed within him like a race of angry sea round Hanford Point. Flakes of red drove across his face, like the foam-bows driven by the wind on the rushing tide. His muscles quivered, and his pulses leaped. He could not go to the cottage till the first paroxysm of passion had passed away. A woman is glib with her tongue both in her mirthful and in her angry moods; she shoots out her words without much consideration. Her tongue is her natural weapon of defence. We would not blame her were she to use it only when attacked, in self-defence. The mosquito also has fangs; but it employs the barbs not only to protect itself, but to goad those who sleep, or ignore its existence, into taking cognisance of its insignificant self. What a light and feathery being it is! how delicately slender, how buoyant on its transparent wings! As we lie on a bench in the sweet summer evening and look up into the skies, full of twilight, like silver resolved into vapour, and our souls mount to the far-off stars, whilst the song of the nightingale chanting among the poplars fills our ears, hmm—hmm—whisp! in an instant our faculties are drawn away from the ideal and transcendental to a minute gnat that has perched on us. Our peace is gone; the poison has penetrated our veins; irritation intolerable ensues; we tear with our nails, but cannot tear the irritation away, though we tear till the blood flows. Does the venomous bite cease to vex in an hour? O no! it lasts for days, and only slowly ceases to worry and anger us.

Why did the mosquito light on us? We offered it no menace; we were not even thinking of flies; we were far away among the stars. Can it be that it affords pleasure to the mosquito to stab and inject an infinitesimally small drop of the most aggravating of poisons into our blood? Can it be that the creature bites us out of envy, because we were in spirit among the stars, instead of occupying our minds with mosquitoes?

It is said that female poisoners have made victims out of mere wantonness, not because they bore spite, but because it afforded them gratification to display their power. It is perhaps the same with the mosquito. Was the Marchioness de Brinvilliers the last of the female poisoners? By no means. The poisoners are as numerous now as ever; they fly about in clouds; they rise up out of every pool; they lurk under every green leaf; they hum in every room. Pshaw! We hulking men, what care we for these midges? Compare our size, our strength, the texture of our bones, the toughness of our skins, with theirs. It is absurd to suppose that we need fear and avoid them. Pshaw! What can a microscopic drop of poison effect in the great rivers of our blood? Pshaw! How can such flimsy, merry-minded, little creatures pierce these tough hides? So we argue, and next moment are writhing and tearing ourselves, and crying out in pain, like Hercules in the garment of Deianira. I have been to an apothecary, and showed him my hands and face covered with mosquito bites, and asked for something to neutralise the irritation. He laughed in my face, and said there was no remedy. So there is no remedy for the bite of that other mosquito; there is no alkali yet found strong enough to neutralise the drop of venom found at the end

of a woman's tongue, thrust into the blood—not, maybe, out of virulence at all, but out of playfulness, out of wantonness. O the hours, the days, the months of tossing, of torment, even of delirium, caused by one little word at the point of a soft little red tongue, shot into the veins and curdling the heart—shot in, in a moment of vexation, without premeditated malice. We may run away from the tormentor, but we carry the poison with us. Perhaps the mosquito is surprised at the effect of its fangs, and would recall the poison if it could; but it cannot; and it comes whirring its wings and tossing its plummy head and piping softly in our ears—asking to be allowed to apply its lips to the wound; but we shrink away; the lips frighten us—behind them lurks the poison. O ye mosquitoes, I pray you be pitiful towards us rude men! We are incapable of protecting ourselves. We cannot permanently abide behind mosquito curtains. But, alas! what avails a cry for mercy? As long as the world lasts, women must sting, and men must weep; and the sooner it's over, the sooner to sleep.

Richard stood under the flowering lime in which the bees were busy, leaning against the palisades, with heaving breast and hands clenched at his side, and brows that lowered and dripped with agony. Real physical pain was at his heart, a pain that affected respiration and pulsation alike, a pain that numbed his brain and hindered it from articulate thought. He had loved Josephine. An uncultured man looks up to a lady of refinement with reverence and worship, such as she herself can hardly understand. To him, she is something so ineffably perfect, that he is ready to become her slave, and ask for nothing in reward for his fidelity and adoration but a smile. It is the most unselfish, ethereal, of all love. It is like that which the Minnesingers felt for princesses in whose courts, beneath whose footstools, they knelt and sang. To Richard Cable, Josephine had been such an ideal; he had looked up to her with infinite love, as to one unattainable; and yet in this looking up was associated a feeling of vast compassion for the girl in her loneliness, her ignorance of the highest aims of life, and a longing to touch her hand with respect and lead her into the right way. What a mistake he had made! He lead her! She had bewildered him, and he had lost his knowledge of the compass-points. He saw that he could be of no use to her, that he was to her an encumbrance and a source of daily irritation. She was out of ease when he was present; his voice scalded her ears; his attitudes offended her; his boots made him insupportable in her room. He set his teeth. A glimmer was in his eyes, like the light beneath a thunder-cloud. He would not bring his children into the house. They should remain with their grandmother at the cottage, and he would spend most of his time with them, and teach them Gospel maxims—the Sermon on the Mount—without suffering her to overhear and scoff at his lessons. No; on no account should they be brought to the Hall, where they might learn to laugh at their father, for his brogue, his boots, his blue kerchief. In the cottage they were encircled with simple and healthy surroundings, and were taught to look up to and reverence their father. He would not have them reared to an artificial life, to be made young ladies of, wincing

at his *V's*, and turning away their faces from his boots. He looked at these boots. They had been serviceable to him on many a rough night. It was true that the leather was greased, and perhaps the grease had not always been fresh. The boots had kept his feet dry when the waves washed the deck. Sailors cannot wear patent-leather dress boots.

Richard could endure a great deal; he was so humble, that he was ready to accept correction; he was so forbearing, that he could allow for the infirmities of the weak; but his patience had its limits. He could not endure the thought of becoming despicable in the eyes of his children. The notion that such an eventuality was possible had never before occurred to him; now it seemed certain, were his little ones to be brought into association with his wife. He put his hand to his head. His rough strong hand was shaking as though he were recovering from a long illness. A qualm almost like that of sea-sickness came over his heart; indeed, everything swayed about and under him. His knees were weak, and would hardly support him. He laid a hand on the top of the palisade and rested his head on it. In a few moments the giddiness would pass away. He put out his other hand on the palisade and shut his eyes. Then he felt something alight on his finger and press it. He looked heavily up, and saw that Josephine's bullfinch had come out of the lime-tree and had perched on his hand. He shook the bird off; but little Puffles, after hovering about a moment, returned and re-lighted on his finger.

What did the bullfinch want? Was it already weary of its freedom and desired to be returned to its cage? Was it frightened at the vastness and complexity of the world, into which it had been launched, and longed for the narrowness and simplicity of the world within bars? With Puffles it was other than with Richard. He chafed at the restraints which encumbered him on all sides, and the bird was frightened at its freedom. He looked at the bullfinch some time dreamily, wonderingly. He held his finger very still, and the bird began to polish his beak on it. Puffles was pleased to grip a warm hand instead of cold twigs. The pressure of the little feet and claws sent a thrill of pleasure along Richard's arm to his heart. In it was an appeal to his protection; and like his mother, Richard's heart at once responded to the appeal of feebleness. He raised his head and put his other hand over the back of the bird. 'Come, Puffles!' he said; 'each to his proper element. You, to bondage. I—I—God alone knows when and how I shall escape!' Then he went in, through the garden, very gently, holding the little creature covered with his right hand, and walking evenly. The bird made no attempt at escape.

At the pantry window stood the butler and the boy, looking out, whilst polishing the silver and glass; and they chuckled as they saw him come along. No doubt he looked absurd, walking slowly with one arm extended, and the other covering the tiny creature that rested on his finger.

'It's o' no use winking at facks,' said the butler, 'or trying to disguise 'em. Master ain't an atom of a gentleman. He don't look it; he don't feel it.'

When Cable reached his wife's room, carrying the little bird, he replaced the creature in its cage and looked about him. Well, it was not fair to her for him to give liberty to her pet without asking her leave. Perhaps he had aggravated her to speak more sharply than she intended; perhaps now she regretted what she had said.

'I'm glad the bird is back,' he said. 'She will be pleased, and think more kindly of me.' His angry mood gave way to gentler feelings. He saw that she had scattered her clothes about the floor as she had taken them off, and left her drawers and wardrobe doors open. He took up and folded her dress, shut the drawers and closed the wardrobe. 'I'm a porpoise in a whiting net,' he said. 'What a different sort of place this is from my cabin in the lightship or my room at the cottage! No nicknacks there. Well, I suppose I must accommodate myself to my shell, as the chicken said that had to be hatched. I can't make my shell fit me like the lobster.'

When a cool leaf is applied to a wound, the fever ceases for a while, but the relief is only momentary. Presently the fire makes itself felt as hot as before. The calmness that had come over Richard lasted only so long as the pressure of the little claws remained on his finger. No sooner had he left the room, than his pain and heat returned. The poison was in his blood. Little Puffles could not undo the mischief done by Josephine. The poison had penetrated to the heart.

He went out of the house once more, and through the garden to the seawall. As he walked he had his hands in his pockets; but suddenly recalling the offence he had given to Josephine by so carrying them, withdrew his hands and folded them before him. How many commandments were there, he wondered, in the social code? The moral was simple enough, contained in two tables. How would he ever master the many and complicated rules, many and complicated as the hieroglyphs of the Chinese tongue, where every word has its special character? A Chinaman learns to read as he learns to speak; from infancy, as his ear catches a sound, it is associated with a symbol to his eye. So a gentleman or a lady grows up amidst the intricacies of social life, and all its symbols and rules become familiar from early childhood. But was it possible for a man like Cable, in manhood, to enter into this sphere and speak and act according to its regulations? Was it not as impossible for him as to acquire Chinese writing and the Chinese tongue?

Then another current of thought set in through his brain. His hands had strayed again to his pockets, and in them turned over a few coins. He was now without a profession. He earned nothing; with the exception of a few pounds in the savings-bank, he had nothing of his own; he would therefore have to apply to Josephine for money wherewith to feed and clothe and school his children—ay, and provide for his mother as well. There were small bills due to the grocer and dressmaker; there was the rent for the house. Must he go to his wife with these accounts and ask her to settle them? The thought was unendurable to a self-reliant, proud man. It galled him to the quick to think that

his dear little ones, Polly's children, and his mother, should be henceforth dependents, not on him, but on Josephine.

No; to this he would not submit. There was but one mode of escape from the difficulty—he must enter into some profession, in which he could earn sufficient for the support of his family. But for what profession was he now qualified? It must be one that was gentlemanly, or Josephine would oppose his proposition. And for a gentlemanly profession he was unsuited, because he was not by breeding a gentleman.

As he puzzled his head with these thoughts, he was roused by a slap on the shoulders from a heavy hand. He looked round and saw Jonas Flinders.

'How are you, old boy?' asked his brother-in-law. 'I'm right glad to come across you. You're all with the dress-circle now, and we in the pit ain't fit to be spoken with, I suppose.'

'You are not just,' answered Richard composedly; 'I have never shown any pride.'

'Well, you're so engaged, we can't get a sight of you. Now you're coming on to the *Anchor*, I hope? All your chaps from the *Josephine* are there. You're not going to give them the slip, I hope?'

Cable started. He had forgotten the supper to the crew. After all, Josephine was in the right; he must be present at that. If he absented himself, he would give offence. Why did she not simply say so, and not insult and wound him?

'I fancy you'd forgot about it. My stars! you've got too grand to remember such little matters.'

'I had been reminded of it. For the sake of attending the supper, I did not go out with my wife; but it is true that for the moment I had forgotten. I was busy with my thoughts.'

'I hope they were pleasant. It don't seem as if they were, judging from your face. Why, as I came up, your face was a-twitching and a-wincing as if you'd been stung by some nasty venomous creature. But there—come along. Treat things unpleasant like Pharaoh and his host—drown 'em.'

#### FRENCH REVOLUTIONARY BADGES.

We do not propose to speak here of the various early revolutionary emblems adopted at different periods of the eventful history of France, each one of which marks a crisis in the nation's onward career, but simply to trace a short history of the badges assumed during the troubles of 1789 and following years, and their subsequent appearance on the world's stage in 1830, 1848, and 1871. Much that is both interesting and new to many of our readers might be said on the two-barred cross of the Holy League; the loaded sling, bunch of coloured ribbons, and wisp of straw of the *Frondeurs* and others; but this would extend the subject beyond reasonable limits.

The most prominent among these badges are the cockades; an old institution in France, they having been introduced to the army by Louis XIII. The cockade is, as a political emblem, essentially French. These quick-tempered and easily moved

people, who love to shout forth their heart-felt convictions to admiring crowds or the coldly indifferent world at large, must have some outward sign of their political sympathies and convictions; naturally enough, therefore, the cockade comes foremost, as the most simple, inexpensive, conspicuous, and visible badge. It is within the reach of poor and rich alike, and may be worn in the buttonhole, or coquettishly ornament the hat. It was regarded as the emblem that excited the soldiers to brave deeds:

L'ornement galant et terrible  
Par qui, désormais invincible,  
Je puis affronté les hasards—

as 'le gentil' Bernard, court-poet to Louis XV., sings.

These well-known rosettes, made of coloured ribbons, became of real political importance, especially in Paris, between the years 1789 and 1800. It was during the Convention and Directory that the cockades were most in use, and perhaps had the greatest importance attached to them; for then, if the red or tricolour was not worn, the man, woman, or child ran serious risk of being maltreated by the mob, if not dragged before the 'tribunals' by the *sans-culottes*, a fate even worse than the former. Everybody, from the little street *gamin* to the wealthy merchant and high officials of the Convention, wore them; they formed part of the uniform of the soldier, the sailor, and the commissary of police. Ladies of fashion had rosettes arranged in their hair, as well as the *tricoteuses*, who pinned them on their *bonnet rouge* while they danced the hideous *Carmagnole* round the guillotine.

Some time before the destruction of the Bastille, the black cockades, which had been adopted on the expulsion of Necker, the popular minister, were almost entirely put aside by the people for tricolour ones. Blue and red—being the colours of the city of Paris—were adopted by the National Guard; and white was added as a symbol of the brotherly love that ought to exist between the National Guard and the royal troops. But before this, a green cockade had been adopted by Camille Desmoulins, and it was under this rallying sign that the Bastille was attacked and pulled down. For a brief period the reforming green was mixed with the Bourbon white. In October 1789, the 'three hundred,' or National Assembly, decreed that no other cockade but the tricolour one, which they authorised, was to be worn in public. During the debate, Lafayette rose and said, 'Messieurs, Je vous apporte une cocarde qui fera le tour du monde'—words that proved to be almost a prophecy, the French soldiers, a few years later, making the cockade well known to many nations, carrying it over Germany, Italy, Austria, even to the gates of Rome, and into the Silent City of the Doges and many other states. Louis XVI. at last had to countenance the three-coloured rosette, always wearing it when in public, as a kind of peace-offering to his persecutors. But it was not well received among the loyalists. Many a dangerous hubbub was caused by the innocent-looking cockades. At a royal military dinner, given by the king at Versailles soon after having been forced to adopt the popular cockade, an officer of the

royal guards rose from his seat and cried aloud, 'A' bas les cocardes de couleur; vive la cocarde blanche, c'est la bonne;' and immediately everybody present trod under foot the national cockades, replacing them with white. This scene gave great umbrage to the liberal party, and was the forerunner of many very serious disturbances, arising from the hatred cherished by the mob for all cockades of only one colour; thinking, and perhaps rightly, that they only helped to encourage party feuds. One day in October 1789, in the Palais-Royal, five of these offending badges were torn from the hats and coats of the wearers and trodden under foot, the wearers being maltreated by the excited crowd.

Orators all over Paris exclaimed against the wearers of the single-coloured rosettes, adding, 'We will hang up to the nearest lamp-post those who dare to wear the anti-patriotic cockades;' for at that time the red cockade was as much abhorred as the white. But, unfortunately, this did not last; the tricolour was little used, and its place usurped by a blood-red rosette. The poor young Dauphin was made to wear that red badge, the symbol of the revolution that had brought his father and mother to a terrible and cruel death.

A curious engraving of a 'popular cockade' is given in Prudhomme's *Révolutions de Paris*, a publication contemporary with the revolution. According to Prudhomme, the cockade was adopted as the national badge by the patriotic General Lafayette, who was then in command of the National Guard, and is probably the identical one which he showed to the Assembly in October 1789. The design was printed in red and blue on a white background. The nation, typified by a female figure, treading upon documents representing the privileges of the nobility and clergy, is seated, and holds in one hand the tables of laws, while in the other she grasps a bundle of rods tied round a huge club surmounted by a Phrygian cap. A medal with the portrait of the king is attached by ribbons to the bundle of rods; and in the corner lies a shield bearing the three *fleurs-de-lis* of the Bourbons. These cockades were extensively sold by the editor and his various agents in Paris. Still, the red cockade gradually crept in and became predominant. At last, great extravagance was expended on these bunches of ribbons; and popular trinkets were devised to replace the simple button: these were small, Phrygian caps, and models of the terrible guillotine, horribly christened by the rabble *le rasoir des nobles*, which were made in more or less precious metals, so as to suit the purse of the *sans-culottes* and the gaudy taste of the *merveilleuses* and the *incroyable*. In due time, the more simple tricolour, and the plain blue or violet (the Bonapartist colours), for a short time came into favour, until they were ousted by white favours and Louis XVIII.

During the three days of the revolution in 1830, Lafayette, who was general-in-chief of the National Guard, distributed large quantities of tricolour cockades both to his own men and to the mob who were fighting in the streets behind the barricades.

When the Parisians got tired of their Citizen King, Louis-Philippe, and were busily erecting barricades in all the principal thoroughfares of

the capital, the tricolour ribbon was again the rage. But, unfortunately for the good city, the red cockade raised its head for the space of four days—from the 23d to the 26th of June 1848—and became rampant. So fierce was this rising, that even women were to be seen going about distributing these red favours and exciting the men to deeds of desperation. A horrible scene took place during the third day of the *émeute*. While the troops were taking one of the barricades and the insurgents fleeing from their posts, a woman wearing a huge red cockade shot one of the National Guards dead, and seized the red flag which he had just pulled down from its staff on the barricade, and waving it above her head, dashed down towards the attacking party, braining one of the men with her staff. She was shot. Immediately another woman lifted up the flag which had fallen from the stiffening hands of her dying companion, only to be shot down the next minute. Such severity was necessary, for these women were only too often the leaders of desperate but helpless rallies of the rebels. During these four days, four generals were shot. General Bréa was taken prisoner at an early period of these miserable conflicts, and was treacherously murdered by the insurgents for not commanding his troops to lay down their arms. He bravely refused to listen to every entreaty and menace of his enemies, preferring to die rather than dishonour his name. The Archbishop of Paris was shot while trying to pacify the rebels; he died the next day from the wounds he had received. The other generals killed were Negrier, Reymond, and Martin Gourgond. General Duvivier died of his wounds, while others were seriously wounded.

Again, the red cockade appeared in Paris, especially at Montmartre and Belleville, and also in Marseilles, during the sanguinary Commune of 1871. The tricolour cockade is still a French official badge, worn alike by the general and the police-officer.

Such was the importance attached to a mere bunch of ribbons variously dyed. Many lives have been sacrificed over these little innocent cockades. They were the symbols of ungovernable political passions, which were at first guided by a handful of unscrupulous men; the general populace, overawed by these tyrants, adopted the badge; and thus the few dissentients were made the more conspicuous, and suffered accordingly.

The Phrygian cap is the next badge of importance. A writer in a revolutionary pamphlet of 1848 gives the following curious origin of this red cap as an emblem of Liberty. He tells us that on the 31st of August 1790 a regiment of Swiss troops, in French pay, revolted at Nancy. After having successfully overcome their officers, they plundered the military chest, and committed other thefts and outrages. A considerable force was obliged to be employed to capture the mutineers, which feat, however, could not be effected until after a long and sanguinary fight in the streets of the city, where, according to another authority, even cannon had to be brought into action. The captured men were sent off to Brest under a strong escort, to work in the galleys for various long terms. However, in 1792, the Commune being in full sway, these galley-slaves

applied for a total pardon, which was immediately granted. Their friends and sympathisers welcomed them back with great rejoicings, thus turning the convict soldiers into momentary heroes. They entered the city still wearing the little red cap, the most conspicuous part of the convict costume, and hereafter to be called the Cap of Liberty. The populace took these caps from the convicts' heads and coifed themselves with them; and thus, through their desperate deeds, they made it an appropriate emblem of a successful and bloody revolution. The writer already mentioned adds that 'this coiffure became the fashion and the sign of ardent patriotism;' and he goes on to say: 'This cap will henceforth only exist as the symbol of Liberty on the plebeian escutcheon, a symbol for ever immortal as Liberty itself.'

However, with all due deference to this authority, we must evidently go to an earlier date for the origin of the badge. It was clearly considered as a national emblem long before 1792, for on the curious cockade already mentioned the cap is shown; and the cockade, Prudhomme states, was accepted by Lafayette some time in November 1789. Again, Prudhomme in a frontispiece to the number of his journal for the 8th of May 1790, places the Phrygian cap in a conspicuous position. The cap appears on two medals struck at Paris in July 1790: one represents the king as taking the oath to a new constitution; and the other commemorates the confederation of the French people. Although these instances point out that the cap was a national badge long before the mutiny took place, it is nevertheless probable that the badge originated with the red convict caps. Many convicts, after having had their prisons broken open and made good their escape, assumed the position of leaders of the rest of the rabble, who looked up to them as heroes and martyrs. This cap, at the height of the Reign of Terror, was almost universally worn by the advanced radicals and the abominable *sans-culottes*. To use the words of a contemporary of the revolution of 1848, the '*bonnet rouge*' lived in the hearts of the people, and was venerated by them, as the symbol of the sufferings of the poor down-trodden people of France.'

The bundle of rods tied up round an axe was another of the revolutionary badges, adopted from the emblems of the ancient Roman dictators. The bundle of rods and the axe represented justice and the strong arm of the law. In France, the place of the axe was taken by a large and knotty club, to represent the force of the people over the higher ranks of society. These last badges were officially recognised, and were used on the coins, bank-notes, and other government property.

The famous tricolour, or French flag, composed of the three colours adopted for the cockades, began its illustrious career as an emblem of the revolution, and a substitute for the more sanguinary red flag, under whose shade some of the most bloodthirsty and inhuman deeds ever recorded in history were perpetrated. It became very popular, and has since deservedly obtained the high esteem of all true French patriots. Under this flag and the eagles of Napoleon Bonaparte, the fiery French soldiers were led to the conquest of Germany, the defeat of the Russians, the complete

subjugation of Italy, and the humbling of Austria. And although it nearly suffered an eclipse in 1871 and 1873, it still rears its head as the proud emblem of the great French nation.

## B L O O D - M O N E Y .

## IN FOUR CHAPTERS.

## CHAP. III.—UNDER A BAN.

'Do you think I have been kind to you, Lizzie?' the father asked by-and-by, and he had to make an effort to speak loud enough for her to hear, although they were so near each other.

'Yes, indeed, papa; you have been kind in everything'—She paused—cheeks flushed, and anxiety in her eyes on his account as well as her own, for he seemed to be very ill.

'Except in one respect, and in it you regard me as acting cruelly,' he said, completing the sentence for her. 'Well, you are mistaken; for in that, too, I am trying to be kind, and wish to be so.—I suppose you, Lizzie, like everybody else, think I am a most fortunate man—that the wealth which flows in upon me day by day, and the success which attends every speculation I enter upon, should make me a contented and a proud man?' His manner was so strange, that she was becoming more and more nervous about him, more and more eager to avoid saying anything which might add to the distress he was so evidently afflicted with at this moment.

'Everybody says that you have been wondrously successful.'

'Yes, I have made money,' he said bitterly, 'and I have been miserable. I have worked, as some men drink, to stupefy myself—to obtain forgetfulness. Mother, sister, wife, children—all save you were taken from me. Upon you I concentrated my last hopes of finding some consolation for the past suffering. I have watched over you as a man drowning watches the distant life-boat, and whilst counting the seconds as hours, struggles with all his might to keep himself afloat until the rescuers reach him. I wanted to see you honoured and admired, high amongst the noblest; I wanted to hear your name mentioned as that of one who used wealth wisely and well in relieving the people around you from the sordid cares of life. But you, too, fail me.'

'I would do anything, father, that could afford you comfort; but I cannot think that you would wish me to sacrifice my peace of mind for a position I cannot endure the thought of occupying. Dear papa, I am not fit to play the part of a great lady. The thought of it frightens me; and besides, I could not—I cannot regard Sir Joshua as a woman should regard her husband.'

'You can respect him, and that is enough. I have known some cases, and I have heard of so many more, in which girls, prompted by the sentimental idea of what is called love, have defied their parents, refused their counsel, and have quickly had bitter cause for repentance, that I want to guard you against this danger. Why, you cannot know what you talk about. You are too young, and are moved by your own imagination. Love only comes when we have sounded the depths of suffering.'

'Have I not suffered something in knowing that I displease you?' she said sadly.

'Are you then prepared to put me aside for this man you have known barely two years? Are you prepared to inflict any pain on me so that you may please him? Are you ready to learn what poverty is, for his sake?'

The questions were hard ones for the girl to answer. At the same instant the sense of duty told her that she should say 'No,' and love told her that she must say 'Yes.' She spoke quietly and truthfully, according to her feelings: 'I think I could endure anything for his sake; but—O papa, I do not want to cause you pain.'

'And yet you do it. No doubt you soothe your conscience with the thought that I am unjust to Corbet, and that—as he was bold enough to tell me—in barring your union I am seeking to gratify my own vanity, rather than to assure your welfare.'

'No, no; I do not think that. I don't know what to think or say; I only know that I am very wretched.' She wiped her eyes, but she could not suppress the sobs which were choking her.

He rose hastily and paced the floor, his right hand grasping the wrist of his left, as if to constrain the fierce throbbings of the pulse. That voice was again ringing its monotonous cadence in his brain, and the words were the same as before: 'Am I right, or is this another act of betrayal?' Suddenly he halted, and, resting his hand tenderly on the girl's head, he said huskily: 'For the sake of a dead friend, I wanted to see you in high places, because I know it would have pleased him. Money is nothing to me now except to buy pleasure for you; and it seemed to me that I had discovered the best way of doing that, when Sir Joshua asked me for you. I felt as if the great ambition of my life was attained. I was glad and proud, and believed that my work was accomplished. But I will not force you, however bitter the disappointment may be to me.'

'O papa,' she interrupted, as she sprang up and flung her arms round his neck, weeping for joy, 'what relief you give me!'

He trembled slightly under her embrace: he had no doubt that this time he had given her pleasure. 'I am glad of that, Lizzie.—Now, will you do one thing for me, before we finally decide how to act?'

'Anything—anything you wish.'

'Then will you try to think quietly over this matter for—say a fortnight, without seeing Corbet or writing to him, or reading a letter from him, and then tell me the result of your reflections?'

'I promise; and he will be glad to know you are so good and kind to me.'

The bright look of joyful and affectionate gratitude with which she regarded him was surely compensation enough for the abandonment of his cherished scheme for her exaltation. After all, if carried out, it would apparently only have gratified himself, and perhaps his friend the baronet. He became entirely reconciled to the new order of things, by the transformation in Lizzie during the fortnight in which she had agreed to forego all communication with her lover. The dull and half-frightened manner, which had been growing daily more marked for nearly a year past, disappeared. The sunshine was in her eyes and on her face again,

and her father could hear her singing merrily with the birds in the early hours of the morning.

For one day, Lizzie had thought it strange that Corbet had made no attempt to communicate with her; but she was relieved of all uneasiness on that score when her father mentioned casually that he had been summoned to London in connection with some proposed new railway in South America. She was content to think that her lover had not written, as he would no doubt calculate that his letter would be intercepted. But although, having pledged herself to hold no communication with him for the brief period her father had fixed, she would not have read any letter she might have received, she could not help at some moments feeling a little disappointed that he made no effort to send her some token that he was thinking about her. It seemed very strange that he should not have done so; and when the fortnight had passed, she became eager to have news of or from him. She told her father that she was still of the same mind as when they had last spoken of George Corbet.

'Very well, Lizzie,' he said, patting her on the head. 'You two have conquered. You can write to him, and say we will be pleased to see him whenever you like. But he has not returned from London yet.'

The change in Mr Edwards was as great as that in his daughter. He walked with a lighter step than formerly, and there was a sense of relief pervading his whole conduct. He spoke more softly than he had been accustomed to do; he was more forbearing towards the blunders of others than he had ever been known to be. Hope of peace had entered the man's heart, and he was glad because Lizzie was glad.

She wrote a short letter to Corbet, telling him that he would now be welcome at Riveling Hall, and asking him to come soon. But when another fortnight passed, and there was still no sign from him, she was disturbed, although quite satisfied that, for some reason, he could not have received her letter. The father observed her agitation, and comprehended the cause. 'I understand this business in which Corbet is engaged is one of great importance to him,' he said reassuringly; 'and he must be very much occupied in preparations for his journey. It may be, also, that as I spoke to him so decisively at our last meeting, he is waiting for me to speak. I shall call at his place to-day, and ascertain when he is likely to be in Sheffield.'

Mr Edwards learned from Corbet's clerk that his master was making arrangements to close his office, and was not expected to be in the town for more than one day in order to wind up his affairs there. Mr Edwards thereupon wrote to his prospective son-in-law, telling him that all objection to his suit was withdrawn, and that Lizzie was waiting for him anxiously.

To this he received what was to him a very strange reply:

MY DEAR SIR—I am obliged by your letter. But since we spoke together, I have come to the conclusion that you were perfectly right—your daughter will be much happier with the man you have chosen for her than she ever could be with me. I am unable to write to Miss Edwards

to explain that I am leaving England, and will probably not return for many years, when I hope to learn that she is happy, and has forgotten yours truly,  
GEORGE CORBET.

The chagrin with which this epistle inspired Mr Edwards was mingled with a certain degree of cynical self-satisfaction. So, then, he had been right. This young fellow's passion for Lizzie had been prompted as much by the knowledge that she would inherit a large fortune as by her own attractions; and as soon as he saw his way to making a position for himself, he callously rejected the girl who had fought so devotedly, so desperately for him. He was not worthy of her.

Edwards folded up the letter carefully, replaced it in the envelope, and put it in his pocket. But what was he to say to Lizzie!—how persuade her that she had made a lucky escape from a man who valued her only as a stepping-stone to fortune? She would not believe it, and again there would be pale cheeks and sad silence in the house.

Yet Edwards felt somehow that there was a false note in this extraordinary missive; there was a suggestion of something behind, when read in the full remembrance of that interview at the foot of the park. Corbet must have been moved by something more than a sudden conviction that the father was perfectly right in opposing the match, before he could have so completely belied the protestations he had then so boldly made, that no power save Lizzie's own request could induce him to abandon his suit.

Edwards decided to say nothing about the letter until he had seen Corbet and obtained a full explanation from him. His silence, however, did not avail much; for Lizzie's anxiety increased day by day, and he no longer heard her singing with the birds in the morning. He was distressed and perplexed. He began to consider whether or not it would be best to wait until he could see Corbet, or to show her the letter, and so get the worst over at once. But he hesitated when he looked at the piteous face, and noted the eager watchfulness for every post, followed by the shadow which fell upon her when there was still no letter from her lover. He determined to end this suspense one way or another. At breakfast, he announced that he was going to London, and would return on the following day. This was nothing extraordinary, for he had occasion to make frequent excursions to the metropolis on business. But this time his journey had special interest for Lizzie, and with flushed cheeks she inquired: 'Do you think you will see—Mr Corbet?'

'Of course I shall see him,' he answered with affected gaiety. 'Have you any message for him?'

'I don't know. I should like him to tell me whether he has got my letter—I should like him to write,' she said with pensive confusion.

'I daresay he will write if he cannot come. I must say that he does not seem to be so eager to come, now that the door is open to him, as he seemed to be when it was closed. Perhaps that is only due to the contrariness of some natures.' This was spoken jocularly, but with a view to prepare her in some degree for the result which he anticipated. She said nothing; but the shaft

had struck home, and the question arose in her mind—had not her father prophesied truly, that this feeling they had believed would endure for ever, was—on one side at anyrate—only a fleeting passion or fancy, which faded whenever a new object was presented to the mind? Then she started away from what was to her a horrible thought—that George Corbet could be false.

'I am sure he will come when you tell him that he may do so,' she said with forced calmness, and bitterly conscious that she did not quite believe what she was saying—that she was only trying to defend the man who had said he loved her, and who had won her love.

The father understood and spoke hopefully; but in his heart he had a feeling of fierce resentment towards Corbet. He believed him to be false, and was angry at the thought that for such a fellow he had given up one of his most cherished projects. However, he telegraphed to him that he wished to see him at Anderton's Hotel, in Fleet Street, that evening at seven on important business. Seated in the train, Edwards tried to see his way through the maze, whilst to his fellow-passengers he appeared to be engaged with a newspaper. He had not one jot of regret on his own account that the match was to be broken off by Corbet, and that his daughter should learn what he regarded as a salutary although severe lesson. He would indeed have rejoiced if he had not been troubled by the fear that the shock might seriously injure her health, and that she, too, might be taken from him. He was also indignant that his approval, which had been so importunately sought, should be insultingly rejected when given. He had a right to know the meaning of the fellow's inexplicable conduct, and he would know it.

At the appointed hour Corbet presented himself in the private room engaged by the great Sheffield merchant in the hotel. Evidently, he was not in a happy frame of mind any more than Lizzie, for he looked pale and worried. He bowed on his entrance, but did not offer his hand; and Edwards, who had extended his, instantly withdrew it, whilst he stared at his visitor with an expression of angry perplexity. 'Upon my soul, Corbet, your manner in meeting me is as peculiar and ungracious as your letter. What is the matter with you? Have you got entangled with anybody else, or are you guilty of some fraud which is about to be discovered?'

'Neither of your agreeable surmises, Mr Edwards, is correct,' rejoined Corbet gravely.

'Then I cannot be wrong—anyway, I hope I am not in supposing that you are sorry for the way in which you have befooled my daughter?'

'I am sorry for her,' was the answer, and there was a nervous twitch of the lips, a slight tremor in the voice, which testified to the sincerity of his words.

'Then perhaps you will be good enough to explain this repudiation of your engagement to her—an engagement made against my will, and which only a few weeks ago you told me would hold good in defiance of my wishes and authority. I have come to London expressly to obtain this explanation, and I do not think you can refuse it, if you wish to be regarded as an honourable man.'

Corbet looked, as he felt, decidedly uncomfortable.

able, and he seemed to be unable to meet the stern gaze of Lizzie's father. He answered in a low numbling way: 'I am sorry; but I cannot explain. You desired to break off our engagement, and now it is done, why are you not satisfied?'

'But you shall explain, I say. Has she done anything to justify this action of yours?'

'No; *she* has done nothing,' replied Corbet emphatically, and for the first time he looked straight in the eyes of his interrogator.

'Then you must have done something which makes you feel unworthy of her. If that is so, I can respect the feeling; but you must yourself tell her why you break all the pledges you have given her.'

'You are mistaken, sir; I have done nothing to forfeit my own or her respect.'

'Then, as I am utterly unable to guess at the motives which have prompted you to adopt this course of deliberate insult to my daughter and myself, you are the more bound to help us to understand the position. You are perfectly aware that you are safe from an action for breach of promise; and you are also perfectly aware that I have had no desire for an alliance with you. But as a mere matter of courtesy towards my daughter, I must insist on an explanation.' He spoke with contemptuous indifference as to what the explanation might be, as if convinced beforehand that it must be some flimsy excuse to veil the fact that the man thought he could make a better bargain elsewhere.

'I have already said that I can give you no further explanation than that I believe you are right—my union with your daughter would not be a happy one.'

'In that case,' observed Edwards, more scornfully than before, 'you must be prepared to hear yourself called a liar and a coward. A liar, because you deceived my poor child by pledges of fidelity which you did not mean to keep—or, at anyrate, do not intend to keep now; and a coward, because you refuse to say why you offer her this unpardonable insult.'

It was evident that Corbet felt keenly this forcible denunciation of his behaviour, and that he had to make violent efforts to maintain self-control, for his cheeks tingled and his eyes flashed fiercely whilst his hands were clenched, as if he were about to strike the speaker down. 'For her sake, I will allow you to say what you have said without thrashing you, as I would have done any one else who had dared to utter one of the words you have used.' He spoke rapidly and with much emotion. 'You do not understand what it has cost me to come to the decision expressed in my letter to you. I have borne your taunts for Lizzie's sake, and that should be proof enough that my feelings towards her are unaltered—and they never will alter. But in her name, and on *your own* account, I ask you to be satisfied, and to seek no further explanation than I have given.'

'But I am not satisfied; and I must take back to my child some information which will content her that this breach is made by you' after full deliberation, and confirms the objection I raised when the affair first came to my knowledge.'

'Will you look back twenty years or so, and then insist?' queried Corbet pityingly.

Edwards lifted his heavy eyebrows quickly, but he replied with calmness, although there was an uneasy under-current evinced by the searching gaze which he fixed on Corbet. 'I am puzzled by your request, but I still insist.'

'Then, if you will have it, blame yourself. The reason why I can neither marry Lizzie nor explain to her is summed up in the name of a man—Jack Wolton.'

Edwards's face became like stone and his lips were parched. 'Well?' he queried stolidly.

'He was my brother,' answered Corbet passionately; 'and you are Ned Altcar.'

#### AMERICAN NEWSPAPER HEADLINES.

THERE does not seem much art about giving a suitable heading to an article or a paragraph of news, yet experience proves that a novel or striking headline attracts attention, and causes to be read that which might otherwise be passed over. One of the most successful of English editors fully recognised this, and himself wrote every headline which appeared in his paper; but in this country the reporter generally writes headings to his own articles, and if he use ordinary intelligence, they are rarely altered. In England, sensationalism and anything approaching 'smartness' are avoided; but in America, the very opposite is the rule. Indeed, so much attention is paid to headlines in that country, that there is engaged on the staff of every newspaper of importance a gentleman whose duty it is to supply headlines to articles and paragraphs. Some of these headline writers are paid large salaries, and have a wide reputation.

Mr George Augustus Sala once said that American journalists rarely take anything seriously; they are perpetually trying to be smart and amusing. Few people who have even an elementary knowledge of American newspapers will call into question the truth of Mr Sala's assertion. The American journalist is nothing if not original; and this ruling passion is strikingly exemplified in the very headlines. We have, for instance, never seen but one heading in English newspapers for those simple announcements which never fail to interest female readers—we mean the Births, Marriages, and Deaths. In America, however, they use such headlines as Cradle, Altar, Tomb; Hatches, Matches, Despatches, and so on; while one original genius sums up life thus—Births, Flirtations, Engagements, Breakings-off, Marriages, Divorces, Deaths. Then, instead of the familiar heading, Poetry, we find Lays of the Latest Minstrels, or The Warblers' Corner. The columns of clippings, however, afford scope for the most variety. One editor heads his column of jokes, *Render unto Scissors the Things that are Scissors*; while another follows with *Ant Scissors* aut Nullus. One Thing and Another, Drops of Ink, Various Topics, Microbes, Nuggets, All Sorts, Faggots, Pressed Bricks—these are a few others taken at random. Hush is, however, perhaps the most appropriate of the lot. These headlines appear very strange to us; yet it should not be forgotten that, nearly one hundred years ago, the *Times* published weak jokes under the extraordinary head of 'Cuckoo!'

The Fargo (Dakota) *Press* has some of its headings in rhyme. Here are two specimens :

Picknickers on a Sunday Boat are lost—A Judgment Sure.

But Lightning Strikes a Meetin' House—The Reason's More Obscure.

If with a Girl Alfonso's Blessed, from Jail the Cubans Shoot ;

While if it be a Boy, they get a Chromo each, to boot.

According to the *Detroit Free Press*, another Fargo paper came out with the following specimens :

In the Spring

The Maiden's Fancy Lightly Turns to Thoughts of Love.

In the Spring the Festive Oil Can Hoists a Servant Girl Above.

In the Spring

The Kansas Farmers for Sweet Rain begin to Pant,  
And in the Spring the People's Hopes are centred  
Hard and Fast in Grant.

This style of thing was kept up for some time, always ending with 'Grant.'

Sensationalism is the great characteristic of American newspaper headlines. When General Grant died, the *Times* headed its article, 'Death of General Grant.' This is how the heading appeared in the *New York Herald* :

Dead !

General Grant Surrenders to the Grim Conqueror.

A Peaceful End.

His Deathbed Surrounded by His Weeping Family.

Nine Months' Agony.

Suffering the Pangs of his Cancer with quiet Heroism.

Medical Skill Useless.

The Sure and Stealthy Progress of his Dreadful Disease.

Story of His Life.

Events of His Varied Career from Cadet to President.

Hero of Many Battles.

Playing a Giant's Part in Crushing the Rebellion.

Gratitude of the Republic.

Twice Elected to the Exalted Office of Chief Magistrate.

His Tour of the World.

Here is another specimen of sensationalism :

Wedding Bells.

Marriage of the Princess Beatrice of England.

Prince Henry of Battenberg.

A Forecast of the Ceremony which will be held to-day.

Revelations of the Programme.

Scene Within the Church of St Mildred at Whippingham.

The Ministers of State.

Queen Victoria Wearing the Crown and Mourning Robes.

The Guests of Royalty.

Breakfasting at Osborne. The Fruits and the Cakes.

In a Floral Bower.

Voyage of Inspection Among the Dresses of the Bride.

Visions of Fair Millinery.

Laces from Ireland, and Tartans from the Highlands.

Myrtle and White Heather.

A Veil that was Worn at the Marriage of the Queen.

Tennyson's Epithalamium.

In some few of our English newspapers there are occasionally seen sensational headlines ; but we have never seen anything nearly so startling as the two specimens we have quoted, each of which headings occupies more than half a column of the *New York Herald*. We believe that in some American papers even more space than this is occasionally occupied by headlines to a comparatively short article. One New York journal, indeed, goes the length of having all its headlines printed in red ink. We have not seen this periodical ; we make the statement on the authority of a trade journal ; but to many journalists

and printers the difficulties of carrying out this plan in the case of a newspaper of even a moderately large circulation seem nearly insuperable. Most English newspapers have no headings to leading articles, and in America we believe the headline to them is rarely allowed to exceed one line. The only noteworthy innovation of late years in the matter of headlines is to be seen in the *Daily News*, in which the headings to the leading articles are what is technically known as 'let in' at the side, a style which is frequently adopted in certain books.

## JONAH FROTH.

JONAH FROTH lay a-dying. Some of the crew, of whom one was a negro, had tenderly propped up their venerable skipper on several pillows, and covered his lower limbs with a tarpaulin. The negro was particularly assiduous in his attentions, and from time to time would heave a deep groan, as if his heart were breaking. The cabin window of the *Flying Scud* was wide open, and through it could be discerned the wharfs and houses of Singapore, and several vessels riding at anchor.

My acquaintance with Froth had been but of short duration ; but I had seen and heard sufficient of the old salt to feel more than a passing interest in the career of this extraordinary person ; and when, one morning, I was summoned to attend his dying bed, and to hasten thither with all despatch, I confess I departed upon my errand with a considerable weight of sorrow at my heart.

As I entered his cabin, the negro quickly rose from his seat at the bedside and addressed me in an excited manner, but in tones sufficiently inaudible to preclude the possibility of their reaching the ears of the dying man : 'Mass'r Froth, em be berry sick dis marnin.'

Five or six big seamen, who seemed evidently embarrassed at the novelty of the situation, were leaning against the wall with their hands in their tarry pockets. Their presence could be of no avail ; they were exhausting all the fresh air that could possibly come at the patient, so I motioned to them quietly to retire. They went out one by one, and very softly, taking one long parting glance, which had in it the significance of a final farewell, at the pale features of their dying master.

At an inarticulate ejaculation from Froth drew me at once to his bedside. I lifted his powerful hand in my own and gently pressed it ; it was as if a child should dandle the paw of a bear. The fingers were enormous, yet they were in perfect keeping with the immense muscular strength and stature of the man ; but the temperature was that of death, and his pulse was barely perceptible. I inquired if he were in pain.

The negro here interposed in a low whisper : 'Mass'r Froth, em hab no pain de ole de de time ; but em berry sick dis marnin, em keep no thing down.'

I administered a slight cordial, which considerably revived him, and, to my astonishment, he

clasped hold of the tarpaulin and gradually drew himself upwards into a sitting posture. It was but a momentary reassertion of his old strength; and I assisted him back upon his pillows, where he lay panting with exhaustion, with his eyes closed. Presently, he re-opened them, as if a thought had struck him, and he began fumbling with great earnestness in his breast-pocket, as if he would dislodge something that was there concealed.

'Em hab a letter from em missus,' promptly suggested the indefatigable negro; 'see em put em in em pocket yester marnin; em no read yet—sure ob dat.'

I saw the whole situation at once. A letter from his wife in England had arrived by yesterday's mail; he was too ill to open it; and nobody on board was sufficiently scholar enough to decipher its contents. I proffered him my assistance in the matter, which he readily assented to; and putting my hand in his breast-pocket, I drew forth a rather soiled packet which bore the following inscription: 'MR JONAH FROTH, Skipper, c/o the *Flying Scud*, Singapore.' I put the letter into his hand, and he grasped hold of it with great fervency; he then raised it slowly to his lips, and returned it to me with one of the most beautiful smiles that ever suffused the rugged countenance of a British seaman. Here the negro uttered a deep groan and wrung his hands, as if in the direst despair.

Froth signalled to me to unfasten the packet and read the contents aloud. I broke the seal, and proceeded with my task, which was one of great difficulty. At first sight, the whole appeared like a mass of Egyptian hieroglyphics; it was the worst writing I had ever seen. The syntax was infamous, and the inflections of many of the words were quite new to me. But what the document lacked in scholarship, it made up in the beautiful and faultless language of the heart. Nothing could have been more tender and playfully confiding. After two or three careful perusals, which occupied several minutes, I considered myself sufficiently prepared to venture on a reading of it aloud to the one man in all the world on whose ear alone could fall, like softest fingerings of invisible strings, the odd and unmelodious accents of its speech. For Froth it was destined to be the last earthly record of the devoted and unalienable affection of that creature to whose bosom he had once been pleased to impart the mysterious secret of his soul's love. The writer (God pity the relict's lot), ignorant of the terrible event that was at this very moment in progress, and all unsuspecting of the store of infinite suffering that was in preparation for her, began in the liveliest vein, and ever and anon would make some jocose sally, evidently intended to disturb the risible faculties of her rugged spouse. Alas, for the irony of Fate! Alas, that the sprightliness and unchecked license of her cheerful, loving heart should, at so inopportune a moment, have led her to wanton around the flickering consciousness of the dying man! It was as if she could be merry over the chill pallors and distressing incoherencies of death. To Froth, the reading of the letter would probably occasion a large amount of mental agitation; not through the lack of all anxiety and distress on his wife's part on account of his present state, but

through the utter absence it would convey of any taint of suspicion that such a state was considered at all probable.

I have not considered it necessary to transcribe the whole of this remarkable document—which now lies in one of my private drawers—nor to adhere always very rigidly to an exact rendering of the original, retaining only such passages as bear more immediately on the present narrative, or that may be of general interest to the reader.

MY DEER HUSBIND—I am quite well and jolly and i hope you be to. Missus bunday says i am gettin stout and deer miss edith the parsins dorter says as how you wont no me in the new cap wich she give me new years day. Mister Tom the squeers son have been a drinkin agen sumit awful, and missus Emblem she have brok her legg wich is very bad for her. As god dellived jonah out of the wale so may he do to you from the danegers of the see. you are a bad chap to stay away so long this time, i dont mind your goin to see as you was born ther and its quit naturul. Aint i proud of my saylor thats all. me and you niver had a hot word together as i can mind and you aint no fool be you tho you was brought in the world all fools day come ome when you can thurs a deer sole. the cow wich you give me last sumer crope thro billy jones hedge munday nite and tredded down his grass wich made un sware bad and the ole sow has had some more piggs. i hope mister Ambatch the black man is well, giv my respects to un and tell un to mind an air your clean close well of a Saturdy nite.—Your own SUSAN.

When I had finished the reading of the letter, I folded it carefully up and replaced it in Froth's breast-pocket. To my surprise, a triumphant smile was gleaming in his large blue eyes. He lay perfectly motionless, but was muttering indistinctly between his teeth. What that something was, who will ever know? During the final collapse of all that intricate and harmonious structure which constitutes what we term a human life, who shall tell what vestiges of the decaying order are invisibly being woven into and incorporated with the new; deriving from their association with the transmuting principles of the fresh being a colour and a breadth of glorification little dreamt of by the sorrowing spectator. I said Froth's was a triumphant smile; then a triumph that indicated the apotheosis of human affection and the purely spiritual appreciation of its object. If so, then the inaudible utterance was the involuntary shout that acknowledged the total surrender of the soul to the satisfying bounties of the revelation.

At this moment, the negro, whose vanity was highly gratified by the allusion to himself, and who had entirely lost the forlorn expression that had hitherto rested upon his ebou countenance, pushed his woolly head in close proximity to my own, and volunteered a personal statement: 'Mass'r Froth's missus em berry nice lady. Ambatch em always ar Mass'r Froth's lily cloz well; em no cotch cold dat way. Like Mass'r Froth's missus: send respec to ole nigger—dat good joke!'

The negro was grinning from ear to ear; and

had I not at this instant clapped my hand tightly over his yawning orifice, he would fairly have given way to a hearty peal of laughter. He came to himself immediately, and looked perfectly miserable at the thought of having so grossly violated all the principles of decorum in an hour of such solemnity. He gradually sank more and more into an inconsolable mood, and went and seated himself over against the door of the cabin, wringing his hands and wagging his head to and fro. I addressed him in a reassuring manner, but all to no purpose. His conscience, like an inexorable judge, had passed sentence of condemnation upon him, and he writhed beneath the lashes of the avenger.

I turned again to Froth. He was beginning to grow extremely restless, throwing his huge arms about, and continually shifting his head from one side to the other. I spoke to him soothingly, and bade him signify if there were anything he would still wish done. He turned and looked at me and smiled serenely—such a smile as only irradiates the face of an upright man upon his dying bed. It was a smile of perfect peace and satisfaction. Death was standing at his side ready with his uplifted dart to strike, but he saw not the monster. Presently he feebly raised his hand and pointed with his forefinger to a corner of the cabin. I looked in the direction indicated, and perceived a large sea-chest lying open, full of a confused mass of books and papers.

'Ambatch,' I cried, 'what is it your master wants? He is pointing at the big chest.'

'Specs em wants em private logbook,' replied the negro, still rocking himself backwards and forwards in an agitated frame of mind.

'Then bring it me at once,' I returned.

The negro did as he was commanded; and after a short and brisk search, he unearthed a dingy-looking pocket-book with brass clasps, and tied about very securely with a piece of red tape. I took the volume, and held it before Froth's eyes. He looked pleased, and made a supreme effort to speak. I stooped and applied my ear to his mouth. A low sound was all that he emitted. I quickly unwound the tape; and having unfastened the clasps, I laid the book open before him. I noticed that one page was doubled under; at this place he inserted one of his fingers, and then pushed the book feebly towards me, looking earnestly round the room, to see who were present. Perceiving that Ambatch and I were alone, he composed himself on his pillows, and made a motion to me to commence reading.

The entry, though made in a somewhat shaky hand, was perfectly legible, and free from all erasures and interpolations. The orthography was correct, and what struck me as being particularly remarkable, the composition was generally grammatical, and always vigorous and well arranged. The thoughts were not loosely jumbled together like coloured papers in a bag; there were no tedious retrogressions and iterations. It was a straight logical course, with but one beginning, one middle, and one end. The whole was a brief and pithy moral retrospect of his past life, concluding with a short appendix, that consisted of a cluster of chronological dates, to each of which was affixed some important event in his private history. It was dated exactly a

month before his decease. I commenced reading as follows:

'I, Jonah Froth, skipper of the *Flying Scud*, with the apprehension of the near approach of death upon me, have thought it right and fit to here set forth, for the warning and encouragement of all those who hereafter shall sail in this craft, some few of the leading principles that have actuated my conduct during the term of my mortal life. I do it with all modesty, conscious of innumerable imperfections, and mindful of frequent departures from the straight path of duty.' This was the preamble. Then followed a brief list of what Froth considered to be the more essential virtues to be cultivated by every seaman. These were—sobriety, honesty, purity, and valour. Then he went on to say:

'As to sobriety, I never was intoxicated in my life, and have often been laughed at for my abstemious habits. In the year 1840, one of my shipmates died from the effects of dram-drinking at Bombay. From that moment I resolved solemnly to give up my one daily glass of grog, and have nothing to do with a fluid that was capable of taking away the life of a fellow-creature. That was more than forty years ago. I have kept my vow. As to honesty, I have never told a lie to any man, that I can remember; and in all my dealings with my fellows, I have ever laboured to be straightforward and above-board. With reference to purity, no one dare tell Jonah Froth that he ever spoke an obscene word. I have never mixed with low company; and as to valour, I have never been frightened of any man. Of the Evil one I have always been afraid; for to be cast upon a lee-shore with the fiend for a companion has always struck me as being the worst of ills. Now, one may be sober, honest, pure, and brave, and yet be a dunderhead; and as I was unfortunately born at two o'clock in the morning, on the 1st of April 1810, it has always been painfully evident to me that I must therefore have consequently been a born fool.'

Honest, simple-hearted Jonah! Who but himself would have had the candour to own as much? And he went on to say: 'No doubt, to this circumstance I must ascribe my thick-headedness in running the *Woodlark*, nine hundred tons, ashore on the Coromandel Coast, in the year 1849, in broad daylight, and with a moderate breeze blowing from E.S.E. The same event probably accounts for my misadventure in the Java sea, on the night of the 1st of August 1856, when I allowed a horde of vagabond pirates to board my vessel the *Sea-swallow*, and batten us down beneath the hatches for sixteen hours, when we were released by an English cruiser that providentially hove in sight. At the same time, I, Jonah Froth, have ever striven to do my duty to the best of my ability. What shall I say more? My hour draws near.'

Here I interrupted my reading. Froth's hour had come. His eyes were fixed, and a glassy film sparkled on their entire surface. I looked at the clock, which was ticking away unconcernedly over the head of his couch: it indicated exactly two hours after noon. Duty it announced the time of day; and then, suddenly as if by magic, the revolution of its invisible wheels was arrested. The pendulum gave one or two faltering oscillations to left and right, and

finally became stationary. At the same instant, a vivid flash lighted up the cabin and shed a momentary radiance over Froth's pale distorted features. It was followed by a tremendous peal of thunder, that shook the timbers of the *Flying Scud*, and went rolling away over the distant waters of the ocean. For a second, Ambatch stood transfixed, with eyeballs bursting from their sockets; then he fled from the cabin and bolted up the companion-ladder like an imp of darkness. Froth neither saw nor heard; Death and I were alone in his chamber.

Children of the ocean, seamen of this worthy craft, away each to your allotted task! An excellent man, a very excellent man, hath passed from your midst. In his name, in the name of Jonah Froth, whose spirit shall walk these decks as your presiding genius, even unto this good ship's final voyage, I exhort you to be men—men of whom old Neptune shall be proud, and whom Britannia shall not be ashamed to call her sons. Would to heaven, I thought, as I dropped into the boat that was to convey me back to the shore—would to heaven that throughout our 'leviathans afloat' and richly freighted argosies, down even to the craziest brown-sailed smack that goes a-trolling in the waters of the North Sea, might be infused the leaven of Jonah Froth! With the entire quantum of British seamen, naval and mercantile, as a multiplicand, and for a multiplier the person of the worthy skipper himself, and I think I see such a solid and irresistible product as might well intimidate even a combination of the war-fleets of entire Europe.

The startling phenomena attendant upon Froth's death have ever since haunted my imagination. The sudden stopping of the tune-piece precisely at the hour of two, which, as he himself writes, was the very hour of his nativity, together with the grand but awful accompaniment of a tropical tempest, were of such a kind as to work an immediate revolution in the whole of my moral being, and to convert me from the enviable condition of a cool and practical observer of nature and her diverse operations, into one of constant apprehension and vigilant watchfulness for signs and tokens of approaching events.

#### SINGULAR GOOD-FRIDAY CUSTOMS IN THE CITY OF LONDON.

A quaint and curious custom has been practised for over four hundred years on Good-Friday in the churchyard of St Bartholomew-the-Great, Smithfield, once the finest Norman church in London, and still exhibiting in what is left of it great architectural beauty in the grandeur of its Norman arcades. In this churchyard, on Good-Friday, twenty-one poor widows, belonging to the parish, are assembled round a flat stone tomb of an 'unknown person;' and each widow 'picks up' therefrom a new sixpence, twenty-one of these coins having been placed there by the churchwardens. The origin of this charitable dole is unknown. There are no traces of any will, nor is there any fund set apart for this purpose; but the few shillings necessary are usually subscribed for by two or three of the parishioners. The legend referring to the dole is, that some centuries ago an old widow lady, a resident in the parish, directed by her will that her tomb in the

churchyard should be visited by twenty-one aged widows after matins every Good-Friday morning, and that they should 'there and then each pick up a new sixpence,' to be laid on the flat top of the stone in readiness for them. Although this curious custom has been observed for four hundred years, the name of the founder has been lost, and even her tomb is unknown. The old ladies, however, are accommodated at a large flat stone without a name, where the dole is regularly paid every Good-Friday morning.

Another very fanciful custom is observed on Good-Friday morning by direction of a pious citizen named Peter Symonds, who died in 1586. By his will he directed that sixty of the youngest boys of Christ's Hospital, commonly called the 'Blue-coat School,' should attend matins every Good-Friday morning in the church of Allhallows, Lombard Street, the testator's parish; and after the service was over, each boy was to receive a new penny and a bag of raisins. This practice is strictly carried out at the present day; the raisins are placed in paper bags, and the pennies, perfectly new from the bank, procured for the occasion. Fully appreciating the good deed of Symonds, another citizen, William Petts by name, who died in the year 1692, by his will directed that 'the minister who preached the sermon on Good-Friday morning to the sixty Blue-coat Boys should receive a fee of twenty shillings; the clerk, four shillings; the sexton, three shillings and sixpence.' This ceremony is strictly carried out every Good-Friday morning, the churchwardens benevolently adding an additional grant, in order that the children of the ward and Sunday schools might also be partakers of some of the nice things appertaining to the Good-Friday hospitalities. On the last occasion, a very large congregation assembled at the church of Allhallows to hear the sermon and witness the singular and interesting ceremonial.

The ancient city of London is remarkable for many curious customs having their origin centuries back, to which, perhaps, we may allude more fully at a future time. The two above referred to are, however, the only ones we believe associated with Good-Friday.

#### SONNET.

THERE is a hallowed sweetness in the name  
Of Poet. Human power may make a king.  
The gift of song is such a holy thing,  
So bright, apart from wealth or worldly fame,  
That wheresoe'er 'tis found, men know it came  
From God. The lark that with untiring wing  
Mounts heavenward morning's sweetest hymn to sing,  
Could not his source of song more surely claim  
Than he who, though by earthly ills oppress,  
Sings, as God bids him, of eternal truth;  
Tears cannot quench the fire within his breast,  
Which burns more brightly, fanned by grief and pain.  
Though death destroy the body, it is vain!  
The soul lives on in Song's perpetual youth.

## CHILDISH THINGS.

WHILE human nature is ready enough to follow the apostolic example, and 'put away childish things' when the age for them is past, it is as ready from time to time, if it be sound and healthy human nature, to share in the many interests of childhood, or to forget family cares and business worries in a game of romps with the little ones. This occasional return to youthful fun and frolic is such an inborn necessity in some natures, that one is sometimes inclined to call the generosity of toy-giving aunts and take-you-all-to-the-pantomime uncles not altogether disinterested. A gray-haired grandfather will go on his hands and knees to superintend the growlings and prowls of a mechanical bear, with a face of extreme absorption, while the children for whose amusement he labours have grown tired of the toy, and are taken up with something else. Bachelor lawyers who have no juvenile excuses of their own, are known to fish desperately for invitations to join the circus-going parties of their neighbours' children; nay, in extreme cases, as many as four or even five grown-ups have gone to the pantomime under cover of *one* child. One reverend father in Scotland, famed as a preacher, having no children at all, yet buys unto himself stores of nursery picture-books, and will spend a whole evening in admiring discussion of Caldecott's *Queen of Hearts* or the *Jovial Huntsmen*. Which of us, indeed, in his inner consciousness, cannot confess to a sneaking enjoyment of the pleasures we ostensibly provide for our juvenile kith and kin?

Like all humane sympathies, this sympathy with the concerns of children has increased of late years. All the surroundings of child-life receive increased attention. The nursery, once the limbo of old carpets and ancient furniture, old chairs, and out-of-date engravings, is now brought into the realm of art. Stained floors, soft rugs, tiled basin-stands; wall-papers, whereon Bo-peep, Little Boy Blue, and the Four-and-twenty Blackbirds repeat themselves; pretty cups

and saucers, tablecloths with dainty coloured borders—these graces of life are all to be found in the modern nursery. And engravings of ruined castles by moonlit seas, the Four Seasons, our beloved Queen in the days of her youth, and the Prince Consort (smiling in a meaningless fashion at each other), are swept away, and their places filled by coloured pictures of child-life. Sympathy half with the children of to-day and half with those children of the past, ourselves 'as was'—a kind of self-pity when we reflect how we *would* have liked such things—such sympathies make us lavish.

Only the other day, visiting at a crowded country-house, I was lodged with many apologies in the nursery of two little girls who were away from home at the time. Full of comfortable arrangements and contrivances, it was a room not to be despised; and when I woke in the morning and looked up, lo! the roof was painted blue like the summer sky with little white clouds, and a cornice of garlands and Cupids charming to behold! I thought of the night nursery of my childhood in the attic flat of a town-house, with furniture Spartan in its simplicity. I recalled those weary hours of open-eyed wakefulness, called by nursery-maids going to sleep, and the fascination and terror of a sloping window in the roof almost above my bed, which from its position was uncurtained, and through which, in the dark winter nights, we from time to time thought we saw eyes look in. The mere suggestion was enough to make us bury our heads under the bedclothes in shuddering fear. That the window was too small to admit the burglar whom we imagined to be lurking outside it and watching us, was but small comfort—the thought that he *was* there filled us with inexpressible dread. Reason and observation have since convinced me that burglars do not habitually spend the night on steep-pitched snowy roofs, and that it was only some homeless, hungry cat whose dimly seen face, looking in, raised our childish terrors. But I have a kind of pity still for those little fluttered hearts in the old night nursery.

Among other childish things, besides nursery furniture, undergoing improvement, picture and story books must not be forgotten. The coarse, almost repulsive, little woodcuts, sometimes daubed with colour, which, intended to assist, really served to fetter our imaginings of Red Riding-Hood and Golden Hair, are things of the remote past, and nursery classics receive the most perfect illustration at the hands of skilled artists. A thousand elucidations of meaning, too, we owe to these gifted pencils and brushes. Who, for instance, knew the real facts of the case when 'the Dish ran away with the Spoon,' before Mr Caldecott explained them in a few magical strokes? We have all repeated the words of the story, thinking them a mere farrago of nonsense. We had no idea of those clandestine meetings, connived at evidently by his relatives the Plates, leading up to the rash elopement. We were quite ignorant, too, of its tragical dénouement—how he fell, and was smashed into little bits; and she, poor thing, was marched off between her hard-featured, unrelenting father the Knife, and her mother the Fork—the latter a strait-laced dame, of whose very existence we had no idea.

Who had discovered—to take another instance—what led the Cat and her kittens to the spot just at the critical moment of the Frog's wooing? Why, on that of all occasions, should they have come 'tumbling in,' to quote the brief but forcible words of the text? History was silent; but by one of those happy glosses which we feel to be an inspiration, Mr Caldecott enlightened us. The Rat, in after-dinner geniality and ease, allowed the end of his tail to hang out of the open window near which he sat. It was a fatal carelessness!

Mr Caldecott threw much light, too, on the character of that nameless and charming *She* who went into the garden—her head stuffed full of silly romances, doubtless—and cut a cabbage leaf, of all things, wherewith to make an apple-pie. When this shiftless young person came to marry the Barber, we feel sure, with an apology to Foote for differing from him, that the imprudence was on the barber's side, not hers, and indeed *She* was very well off to be wooed and married at all! Then the Garyulies came to the wedding. We had very vague ideas before as to who they were—though we could conjure up the great Panjandrum; but now, when we see their friendly talkative faces, we know them at once for the very embodiments of the garrulous folk of all time.

Not in his mirthful pictures only has Mr Caldecott endeared himself to children and to all who care for childish things. As long as Mrs Ewing's beautiful stories of *Lob lie by the Fire*, *Daddy Darwin's Dovecot*, and *Jackanapes* have power to charm, so long will his illustrations of them delight us. There is a pathos he little dreamt of in his sketch of a young child coming to lay a wreath of remembrance on the grave of her who was the children's favourite story-teller. It seems doubly pathetic now that he, too, has been taken by death, and silently claims our remembrance.

M. Ernest de Chesneau, in *La Peinture Anglaise*, remarks, that from the 'honest but fierce laugh of the coarse Saxon, William Hogarth, the delicious smile of Kate Greenaway,' there has

passed a century and a half. But in the department of nursery literature, fifty years have sufficed to effect as great a change; Mrs Ewing's genial teachings have superseded Mrs Sherwood's grim severities; and the rod of castigation so vigorously used by the author of the *Fairchild Family*, turns into a fairy wand of enchantment in the fingers of Madam Liberty. Oh, little children of fifty years ago, how you were goaded to righteousness! How narrow and strait was the way made for your feet!

One of the most deservedly popular nursery classics is a translation from the German of the well-known *Struwwelpeter*, and to a recent edition there is added an author's preface. Herr Hoffman, the author in question, tells how he came to write the book. On his little boy's birthday, his wife charged him to bring home a picture-book. He went accordingly to the bookseller's and looked over a number; but all were the same namby-pamby tales and pictures of good children who were invariably rewarded, and little sinners who came to grief. The monotony and prosiness of all the books he saw struck him so forcibly, that he bought a book of blank pages, and took it home to his wife, announcing his intention of filling it himself; and so we have the famous *Struwwelpeter*. That Herr Hoffman was no artist, matters little; the pictures and stories are genuine good fun. The morals, too, are essentially nursery ones. Johnny Head-in-Air, Fidgety Phil, Shockheaded Peter, and Augustus who 'quarrelled' with his soup, illustrate and satirise faults to which children are really prone, and which they need to be laughed out of. Then, what could be more purely comical than the reversed positions of the greencoat man and the hare, when she has stolen his gun and spectacles, and

Runs after him all day,  
And hears him call out everywhere,  
Help! Fire! Help! The hare—the hare!

Or more impressive than the little black silhouettes of the naughty boys whom Great Agrippa dipped in the ink because they jeered at the harmless blackamoor! Every page is certainly a mirror held up to child-nature, and that the reflection is a good-natured caricature does not take from its interest.

Among childish pleasures, perhaps the most enviable and, we fear, the most unattainable to us older folks, are those of the imagination. If Mr Ruskin's 'great law of noble imagination,' as he calls it, be indeed true, our case is all the harder. 'It does not create—it does not even adorn,' he tells us; 'it does but reveal the treasures to be possessed by the spirit.' The visionary world in which children pass so many happy hours is round us too, if we could only see it; but our eyes are holden by the cares of this world, perhaps. We listen to, wonder at, are amused by their glowing fancies; but are ignorant and unaware, except when they choose to interpret. Ruskin says of children: 'They are forced by nature to develop their powers of invention, as a bird its feathers of flight;' and we might add, the inventive faculty, like a bird, is apt, when fully grown, to fly away. Then, when their own imaginative resources begin to fail them, one observes children begin to

read books of adventure with avidity—at the age, say, of ten or twelve years. Before that, no Rover of the Andes or Erling the Bold can equal the heroic achievements they evolve from their inner consciousness. Who, for instance, could hope to 'put a patch' on the experiences of those two little boys who spent a snowy day during the Christmas holidays tiger-shooting in their father's dining-room; and as one, making his cautious way among the legs of the dinner-table, for the nonce a pathless jungle, was hailed by the other with, 'Any tigers there, Bill?' he answered gloriously: 'Tigers? I'm knee-deep in them!'

## RICHARD CABLE,

### THE LIGHTSHIPMAN.

#### CHAPTER XXVII.—IN THE 'ANCHOR.'

THE parlour of the *Anchor* had a cosy look. Although the time of year was summer, yet on the coast the evenings were at times sufficiently cool to make a fire acceptable. On this evening a small fire of wreck-timber was smouldering on the hearth, emitting its peculiar gunpowdery odour, and the glow gave geniality to the little room, as a smile to a plain face. The window was small, with red curtains to it; and before the supper was over, the curtains were drawn and a lamp lighted. Some lumps of coal were put on the fire, and bubbled and burst into puffs of flame.

Richard knew the room very well. He had often been in it, and had spent there many a pleasant hour. As he sat in it now, a sensation of relief came over him. He was once more among friends, among men of his own educational stamp, men he could understand, and who understood him; men who were not on the watch to find fault with him, who respected, and did not look down on him. Richard had always been a sober man; but he had been no teetotaler; he took a glass with his mates, and made the glass last a long time. He had never been a sociable man, but had always been kindly, ready to listen to yarns, and patiently hear puzzle-headed arguments, and laugh at jokes, and take interest in the affairs of his comrades. He was no talker, but a capital listener. When asked for his advice, he gave it modestly, and made no remarks if it were not followed. Should the talk take such a turn as offended him, he showed his disapproval by rising and leaving the room. On one occasion only had Richard occasion to speak out, and that was when his brother-in-law intercepted his exit. Then he said gravely: 'I cannot bear it, mates—because of the little uns at home. When I'm with you smoking, I take the smell of the 'baccy home with me in my jacket; but that don't hurt. But when I hear you talk this way, I'm feared lest the taint of it go home in my clothes to my innocent children.—No offence; I must go. There are six of 'em, and the youngest is a baby.'

Richard Cable, as all the men knew, was a long-suffering man, slow to take offence, and never giving it. That fellow must be uncommonly provoking who roused Dick to anger. He could bear much chaff, taking it good-humouredly,

and he did not resent, though he disliked, a practical joke. How his comrades would have marvelled had they been able on that evening to see into his breast, at the fuming, tossing fever that there worked, kindled, stirred up by a woman's tongue!

'I faith, Dick,' said Ephraim Marriage, the mate, when the steaming grog was brought on the table with the white clay pipes, 'I'm glad you've come. Jonas said we should see no more of you, now you'd gone away from us for ever; but I didn't think it; I knew you better.'

'Give us a paw, captain, over the table,' said a sailor, glowing with affection and animation at the sight of the spirits and hot water and sugar.

'Every wessel,' said Moses Harvey sententiously, 'is marked with the mark of the port to which she belongs; it is CH. for Colchester, and HD. for Hanford; and wherever she may go, into whatsoever seas, a-trawling, or a-drudging,\* or a-coasting, she's known by her marks whence she comes and to what she belongs. Now, mates, our good friend Cable was built and launched here at Hanford; and though he may cruise away into oceans and seas and spheres to us unbeknown, yet wherever he spreads his sail, there it will be known he don't belong to no ports or harbours of them there foreign parts or spheres, but to us: he's marked HD. right over his bows, and got it writ in his inmost heart, in the log of his good conscience.'

A rapping on the table, a clinking of spoons, a stamping of feet under the table, and a 'Hear! hear! hear! Right you are, Moses.'

'I've heard tell,' continued Harvey, stimulated by these tokens of approval, 'that in disturbed and warful times, wessels sail and traffic under foreign colours. But I don't care what colours our captain, Dick Cable, may hoist; we look to his letters, not his flag; and we recognise our old friend and mate by the HD. on his bows.'

Renewed applause.

Cable's heart was soothed by these tokens of welcome and affection and regard. These men said what they thought, and spoke out the feelings of their hearts. There was no humbug in them; they were honest and true throughout.

Perhaps Josephine was right when she said that Lady Brentwood had invited him to dinner only that she might laugh at him. Perhaps the Admiral, the Lord of the Admiralty, the Justices of Peace, the Baronet, would have been civil to him with their lips to his face, to make jest of his manners and mode of expressing himself behind his back. He did not understand the ways of that class of life, and Josephine did. She belonged to it.

Then Cable stood up and pulled off his frock-coat, and folded it up and put it aside on the cupboard. 'I can't bear to sit in it any more,' he said. 'It is like as if I were in a strait-waist-coat in an asylum. I'll sit with you, mates, in my shirt sleeves, as I've no jersey.'

'You put off the gentleman along with the coat when with us, eh, Dick?' asked Jonas Flinders.

'I never was, and never shall be, a gentleman,'

\* 'Dredging' in the Essex fisherman's vernacular is 'drudging.'

said Richard with a little warmth. 'The making of one is not in me—what with my pockets and my handkerchief and my *Wees*. I'm a plain man, always was, and always will be.—They tried to put my hands into gloves, he went on, waxing hotter—'kid gloves they were; and I busted 'em right down the back, as I've seen a taut sail go in a squall. They tried to get my feet into fashionable boots, and I was like a cat in walnut shells, or a Chinese lady, needing ladies'-maids to hold her up when she sets her foot to the ground.'

The men laughed. Richard, with shaking hand, refilled his glass. He was angry at the recollection of what he had undergone. He swallowed half the contents of his tumbler, and went on irritably: 'Whatever you do, mates, keep clear of polite society. It is like the Dol-drums, where you never know which way the tide is running and from what quarter the wind will catch you.'

'Not much chance for any of us to get into it, captain,' said one of the men; 'the luck don't come to every one to marry an heiress.'

'Leave my wife out of the game,' said Richard hastily; 'I'm not alluding to her in any way. I'm speaking of polite society in general, and them as have the misfortune to swim in it. I've seen this day a bullfinch that wasn't content to live outside a cage, and liked to hop about from one dry stick to another. There are folks that have been bred and grown up in social cages, and they are only happy inside of them. Give them a little red sand, and a few drops of water and some chickweed and a lump of white sugar, and they are content. They don't care for the green trees and the free wind, and the grass twinkling with morning dew. All that is barbarous to them.'

Richard had become loquacious. The fire burned in his heart, an angry resentment against the new world into which he had been introduced, and for which he was unsuited; and his heated feelings relieved themselves in words. His pride, which had been broken down, reared itself again.

'It must be uncommon irksome,' said Ephraim, 'having to wear a coat to your back all day, as if you were always agoing to church or chapel.'

'It is not only that—you are tied and encumbered in everything, Eph!' answered Cable. 'When David the shepherd boy wanted to fight Goliath, King Saul must needs clap on his head his helmet, and wrap his breastplate over his breast, and put greaves of brass on his legs. Then David could not get along a step, and he said: "I cannot wear them—I have not proved them." It is much the same with me. They're a-girding me and an arming of me, brass here, brass there, brass everywhere, and I am nigh on crushed with the weight.'

'It must be terribly inconvenient,' said one man, 'to have to wear a good cloth coat and waistcoat and trousers at meal-time, and instead of enjoying your wittles, to be a-thinking and a-pondering and a-considering all the time, lest a drop of gravy or a bit of butter should come on the cloth and spoil it. Heart alive! what it must be to have the mind a-travelling over one like an invisible cloth-brush cleaning off the crumbs and specks all the time one is eating!'

'I suppose,' said another man, 'you've got to be wonderfully choice what you say?'

'That's another of the wexing things in polite society,' answered Cable. 'Did you ever hear Tom Catchpool tell of the juggler he saw in India? He saw a native conjurer dance blind-fold among knives and razors stuck in the ground with the blades upmost, where a false step might have cost him his life. He danced for an hour and did not get a scratch. For why? Because he was brought up to it from a baby. It is just the same in polite society: there every blessed letter of the alphabet sticks on end, sharp as a razor, and I defy '—he beat his fist on the table—'I defy any man who has not been brought up to it to get along among them without getting gashed and spiked at every turn.'

'And,' threw in Moses Harvey, 'what they call the vowels is the wust.'

'I've been aboard a wessel all my life,' said Cable grimly, 'but I can't pronounce *We* right.'

'I suppose you live like a fighting-cock at the Hall?' observed Ephraim.

'There's enough there and to spare,' answered Cable. He emptied his glass. He flushed hot with the remembrance of the indignities he had undergone on account of his mode of eating. 'Polite society knows how to cook its food, but is mighty particular how you eat it.—But there, mates, we've had enough about polite society. I've seen at Orford or Aldborough or thereabouts—I can't at the moment mind exactly where it was—a tree growing that folks say was planted upside down, and the roots have grown into branches, and the boughs have been converted into roots. That is what polite society is—the honest world turned topsy-turvy. You have my last word on it. God save the Queen!'

'When shall you be going another cruise in the *Josephine*, captain?' asked Ephraim.

'I'll have Jim Cook to repaint the name of the yacht,' said Cable; 'she's not to be called the *Josephine* any more.'

'Change her name!'

'Ay, change her name. You see, mates, it's the name of my—my wife, and I don't care to have it in every man's mouth. Besides, we none of us speak it aright. There's properly no *Joss* in it at all.—But there; you need not try to give it right. The name shall be altered to-morrow.'

'What will you call her, Dick?'

'The *Bessie*—that shall be her name henceforth.'

Then up stood Hezekiah Marriage, captain of a small oyster smack, and said: 'Fill your tumblers, gentlemen. I rise on my legs—on my hind-legs, gentlemen.'

He was interrupted by Cable, who exclaimed roughly: 'We are none of us gentlemen, I least of all.—Call us mates.'

'Very well, Captain Dick,' said Marriage. 'I rise to my hind-legs, mates; I accept the correction with a grateful heart. We are not gentlemen; we don't belong to polite society; we are rough Skye terriers, every one of us. I rises'—He paused—he was not a fluent man. 'Gentlemen!—I axes pardon, I mean, mates—you have not all got your glasses brimming, and the toast I rises to propose is one that demands the—the flowing bowl.' He cleared his throat noisily and looked round. His face was moist, the strain of elocution was enormous. 'I rises on my'—

'All right, Captain Marriage; you've been a-rising on them hind-legs a score o' times; keep up on 'em, and don't come down again,' said Jonas Flinders.

'Allow me to get along as I can,' entreated the speaker, 'or I shan't get along at all. I propose the full and flowing bowl to be emptied to the health of Mrs Captain Cable, the real old and original Josephine.'

'I object!' shouted Richard, starting up and striking the table. 'I have said already that I will not allow my wife's name to be brought in. I refuse to permit the toast.'

'Having risen to my hind-legs to propose it,' said Marriage argumentatively, 'I can't a-draw it in again. Toasts ain't like snails' horns.'

'I will not have it drunk,' said Cable angrily. 'Do you want to offend me, and make me your enemy, Mr Marriage? You all?'

'No offence is meant; the contrary was intended,' argued Hezekiah. 'How can there be offence in proposing or in drinking the health of Mrs Cable?'

'I have said I will not permit my wife's name to be introduced here,' cried Richard. 'You have all heard me announce that.' He looked angrily round the table.

Was this the same Richard Cable whom all had known?—this irritable, touchy man? What had transformed his nature, once so placable? Only a drop of poison on a tongue-point introduced into his veins.

'Now, look here, mates,' said Marriage. 'The toast is out, and it's unconstitutional to haul it in again; but I'm a peaceable man, and I'll tell you how we'll compromise the difficulty—we'll drink the health of Mr Cable and all his belongings.'

Richard was in that chafed temper that takes umbrage at trifles; but he saw that he had acted unreasonably, and he raised no further protest. The toast was drunk, but with an abatement of enthusiasm. Then he stood up to reply, having first fortified himself for the effort with his glass. 'Mates,' he said, leaning over the table, resting on his knuckles, 'I'm nought as a speaker, as you all know. I thank you for the cordiality with which you have drunk my health. As I said afore, so say I now; I'm not a gentleman, and never will become one. Silk purses are not made out of sows' ears. I daresay you've all heard of Mahomet's coffin that hangs betwixt heaven and earth, held up by a lodestone. The coffin that contains the corpse is of iron. Well, mates, I'm not altogether like Mahomet, but I am in part. I'm lugged up by the feet; but my head and heart are down below, and the position is neither becoming nor comfortable. Moreover, in the place where my feet now are, in the elevated region of polite society, my feet are objected to because my boots have been greased against seawater, and they will take no polish, and are otherwise objectionable. I'd like to draw my feet down to my head, mates—but—I can't. I thank you all.' Then he emptied his glass and sat down.

'You'll excuse me for rising,' said Marriage, blowing with excitement and nervousness, 'because I have a duty to perform. I meant no offence before, and I rise now to make what amends for any mistake I may have made. I'm a poor hand at speechifying. It is like running

in a boat over the flats when the tide is setting outwards, and you feel beneath you the farther you go that the water is a-shallowing and a-shallowing, every pull that brings you nearer the shore. The toast, my mates, that I rise—that I rise to propose is one, I'm sure, you will all drink with the greatest cordiality and with three cheers. The toast, mates, I rises on—I mean I rises to propose, is to them dear little childer, seven in all, nestled as doves under Master Cable's spreading vine. I say, mates, though we be rough old water-dogs, that we've got tender hearts, and we respects and admires a lovely sight, such as them seven little innocents, beginning with Mary down to the baby, all brought up as they ought to be, in the fear of God, and in order and love and peace; and I do but express the feelings of all here present when I say—God bless the darlings all.'

Then the room rang with cheers; and Richard, with the tears rising into his eyes, leaned over the table and clasped the hand of Hezekiah Marriage and shook it again and again and again; but he said not one word; he did not thank him, for his heart was full and he could not speak.

(To be continued.)

---

#### WILD MEN AND WOLF-CHILDREN.

As a general rule, the line of demarcation between mankind and the lower creation is sufficiently sharp and well defined. Even those savage races who appear to us to stand on the lowest round of humanity exhibit several most essential points of difference from the brutes. Yet, though no large number of men has ever been found without some of the distinctive marks of humanity, we cannot say as much of individual human beings. Even when we ignore the exaggerated accounts of popular tradition, there still remain some well-authenticated cases of unfortunate beings who resembled the rest of mankind in nothing but their human form. They are mostly children who, through accident or neglect, have grown up without any human nurture or care, and who have adopted the habits of those animals with whom they have been compelled to associate. Under this head we may mention the case of the lad whom Gilbert White describes in his *Natural History of Selborne*. This delightful author tells us that in his village there used to be an idiot boy, who from a child showed a strong propensity to bees. They were his food, his amusement, his sole object. The winter he used to doze away, after the manner of that insect, in an almost torpid state by the fireside; but in the summer he was all alert, and in quest of his game in the fields and on sunny banks. Honey-bees, humble-bees, and other kinds he used to seize with his unprotected hands, without any apprehension from their stings, and at once disarm them of their weapons, and suck their bodies for the sake of their honey-bags. Sometimes he would fill his bosom between his shirt and his skin with these captives. As he ran about, he used to make a humming noise with his lips resembling the buzzing of bees. The lad was

lean and sallow, and of a cadaverous complexion; and, except in his favourite pursuit, in which he was wonderfully adroit, discovered no manner of understanding. When a tall youth, he was removed to a distant village, where he is said to have died before he arrived at manhood.

More to the point, however, is a case related by the German philanthropist, Count von der Recke, who, after the Prussian war of independence against Napoleon I., opened a Refuge near Düsseldorf for the many hundreds of miserable children whom the distress of the times had driven forth from their ruined homes into the fields and woods. One day a lad was brought to this Refuge who had been found crawling on all-fours among a herd of swine. His body was incased in a thick crust of dirt. Only a few rags remained of what had presumably been his clothes. His bleeding face bore witness to the stout resistance which he had offered to his captors. It appeared that he had formerly been employed as a swineherd by a farmer in one of the neighbouring villages. In the night, he had been shut up in the pigsty together with the objects of his care. As his master did not give him enough nourishment, he had indemnified himself by making one at the trough, and by sucking the teats of the sows. When his master's farm was destroyed by the French, he had fled with his pigs to the woods, and had lived there ever since. All this was discovered long afterwards, for the lad himself could only speak a few words: his only answer to the questions that were put to him was an inarticulate grunt like that of a pig. Great difficulty was experienced in keeping him away from the lettuce-beds; he used to crawl on to them and begin to graze like a four-footed animal. The lad had probably never been much better than an idiot. His head was small, his forehead low, his eyes bleared, and his jaws protruding. He never lost his fondness for pigs. To the last he loved to associate with them, and they seemed to understand him.

Another wild boy who was received into the same Home exhibited no small resemblance to a bird. His eyes moved about in their sockets like those of a bird; his face wore a bird-like expression. He could not utter any articulate sound; but he imitated the notes of the songsters of the woods with marvellous skill and correctness. It was supposed that he had spent the greater part of his life in the forest, where he had sustained nature by climbing the trees and sucking the eggs of birds.

A similar story is told by Procopius the historian. In his time, Italy was repeatedly laid waste by the incursions of the Ostrogoths. In one of the deserted villages a little child and some goats were left behind. One of the animals appeared to have established herself as the foster-mother of the child; for when the parents returned after some years, they were greatly surprised to find the boy still alive, though he had in the meantime contracted many of the peculiar habits of the goat. He was called *Ægisthus*, or 'Goat-child.' The historian adds that he himself saw the lad, and was therefore able to vouch for the authenticity of the story.

In the early traditions of most nations we meet with tales of animals suckling infants who have been exposed through the jealousy of some tyrant, and who afterwards become great kings or heroes. We need only remind our readers of Cyrus, the founder of the Persian empire, who was saved through the kindness of a female dog; and of Romulus and Remus, to whom it was believed that a she-wolf had given sustenance. In most of these stories the wolf plays a very prominent part. It is needless to add that they are all mere myths, and as such, unworthy of credence. But the same cannot be said of the possibility of a child growing up among wolves, which is suggested in them. The following facts—the substantial truth of which there is no reason to doubt, since they are related by the eminent Anglo-Indian Sir William Sleeman—would seem to prove that such a thing is not altogether so impossible as at first may appear.

In the wild glens through which the river Gumti rushes down into the Ganges, wolves are still common; and they frequently carry off children out of the towns and villages. The Hindus are withheld by superstition from killing these animals within the precincts of their own habitations; for they believe that a village in which even a drop of wolf's blood has been shed is doomed to destruction by fire and sword. The consequence is that, in spite of the rewards offered by the government for the heads of these animals, many victims are still year after year devoured by wolves in India. In the town of Sultanpore, Sir William was shown a boy who, in his habits and his general appearance, bore the most wonderful resemblance to a wolf. He had been found crawling on all-fours, in the company of a wolf and her three cubs which had come down to the river to drink. Since his capture he had made repeated attempts to escape. Cooked meat he rejected with gestures of loathing and abhorrence; but when he was offered raw meat, he devoured it with avidity. He would allow dogs to share his meal; but if approached by human beings at such a time, he would growl in a threatening manner. When he saw children, he would rush at them, bark like a fierce dog, and attempt to bite them. The lad was subsequently received into the house of Captain Nicholetts, of the First Oude Infantry Regiment. Under the kindly care of this gentleman he lost some of his ferocity, and was broken of his habit of biting. He also learned to eat cooked food, though he still continued to prefer raw meat. He was very fond of bones, which he would crunch like a dog. When food was given to him, he would run up to it on all-fours and devour it greedily, pulling it about and tearing it in a wolf-like fashion. His voracity was all but unappeasable. He would eat half a lamb at a meal, wash it down with a vast quantity of buttermilk, and then swallow some clay and small stones. Children of his own age he would have nothing to do with: his favourite playfellows were a small pariah dog and some jackals. These animals had to be shot, as they helped themselves too freely to the food which had been placed for the boy. Their death did not, however, seem to give him any concern. Clothes he could not endure, and he impatiently tore them off, even in the severest weather. A mattress stuffed with cotton was given him to sleep

on; but he tore it up, and swallowed the cotton with his bread. He never spoke a word till a few minutes before his death, which took place in his twelfth year, after a short illness. Just as he was about to breathe his last, some reminiscences of his early childhood seemed to come back to him. He put his hand to his head, said that it hurt him, asked for water, and then died.

Sir William describes seven other 'wolf-children,' the majority of whom he declares that he had seen with his own eyes. One of the most remarkable of these cases is that of a boy who in his third year was carried off by a wolf while his parents were at work in the fields, and who was recovered six years afterwards as he was going down to the river to drink with the old wolf and her young ones. A mole and a scar on his left arm led to his identification. When Sir William saw this boy, he had already been in some degree tamed. But he never learned to speak. He refused to wear clothes. He walked on all-fours, and preferred raw meat and carrion to any other kind of food. Frogs, which the village children caught and threw to him, he devoured with avidity. At night, he would often run off into the woods, and on such occasions his parents had great difficulty in recovering him.

It is curious how closely most of these Indian stories of 'wolf-children' agree in their general features, and even in some of their details. The manner in which the capture of these children is effected is, to say the least, suspicious; the constant recurrence of the wolf going to the river to drink gives that part of the story a somewhat mythical tinge. We cannot, of course, refuse to believe those facts which came under the personal observation of Sir William; but the earlier part of the narrative may possibly have taken some of its colouring from the exaggerative tendency of the Oriental imagination.

A glance at the kindred cases recorded by European writers reveals a striking resemblance to these Indian stories. In Wilhelm Dilich's *Hessian Chronicle*, purporting to be a truthful narrative of the events which happened during the author's lifetime, we are told that in the year 1341 some hunters found a boy among a pack of wolves. Dilich does not say whether he saw the child with his own eyes; but he describes him as walking on all-fours, shrinking at the approach of strangers, and crouching under tables and benches, and refusing all cooked food.

A Hanoverian writer of the seventeenth century relates that in 1661 two children were discovered in the company of bears in the forest near the Polish town of Grodno. One of them escaped together with the bears; but the other, who was a boy of about eight or nine years of age, was taken to Warsaw, and there presented to the king, John Casimir. The king for some time kept him about his court, had him christened, and then turned him over to Peter Opalinski, one of his chamberlains, who attempted to utilise him as a scullion in the royal kitchen. In a long Latin poem, written by some scholar attached to the Polish court, a complete history of the wretched lad is given from his first arrival at Warsaw till his final escape into the woods. Like all his companions in misfortune, he is represented as moving about on all-fours in a heavy, lumbering way. He would eat anything, but was particularly

partial to raw meat, ripe fruit, honey, and sugar. It was also remarked that when he walked erect, as he sometimes would do, his general resemblance to a bear became more striking than ever.

Among other more or less genuine cases of this kind we may mention the 'wild boy' who bellowed like an ox, and who some time ago created a great sensation at Bamberg in Germany; the girl who was captured at Chalons in 1731, and of whom it was said that she had been living in the river Marne like a fish; and the wretched creature in whom Lord Monboddo thought he had discovered a specimen of primitive man.

It cannot be fairly maintained that these and similar stories contribute much either one way or the other towards the solution of the great question at issue between anthropologists in regard to the origin of man, for none of the facts are sufficiently removed beyond the shadow of a doubt to afford ground for a scientific theory. In matters of this kind, even the most truthful and sagacious of men are prone to exaggeration and error; and for a great many of the facts we are dependent on witnesses whose accounts are by no means unimpeachable.

### IN FOUR CHAPTERS.

#### CHAP. IV.—ATONEMENT.

To be suddenly stricken to the earth when one feels firm of foot and sure of the way he is going, is a calamity which none would survive but for the merciful stupefaction that accompanies the blow. Edwards, assured of his wealth, full of cynical satisfaction at what he imagined proved that his objections to Corbet had been just, had spoken to him with the authority of a man who had been wronged and had the power to resent the wrong. Now, half-a-dozen words had brought him down from his high pedestal; and he felt like the guilty man who, having accepted trial by combat, finds himself prostrate with his antagonist's sword-point at his throat. It was by no force of will that he did not wince or tremble or remove his stolid gaze from the flushed face of the man to whom he had spoken so contemptuously. He was for the moment numbed in mind and body, and he stared at the speaker as if under the spell of some horrible fascination. At length he found voice, and although it sounded somewhat hollow, it was distinct. He did not attempt to deny his identity. 'I knew Wolton many years ago. We were friends—close friends; but you cannot be his brother. You are too young, and you do not bear his name.'

'And you are not generally known as Altcar. You have forced this explanation from me; but I do not wish to worry you more than is unavoidable, although what you did years ago, and the manner in which you have treated me now, would excuse anything I could say. The thought of your daughter is your shield.'

'You are most kind; but I am not aware of any necessity for your consideration.'

'I will answer your questions first, and you can afterwards measure my forbearance by your own conscience.—Jack was the eldest of a numerous family, and I the youngest. After his death, my mother decided that to protect us from the shame attaching to the memory of it, our name should be changed to that which was hers before her marriage. I was too young at the time of poor Jack's misfortune to be told or to understand, if I had been told anything of the affair. My mother kept silence; and I grew up ignorant that my name had ever been other than Corbet, and ignorant that my brother had been executed for murder.'

'I do not see how all this affects me or my daughter,' commented Edwards mechanically, his position unchanged. He wanted to learn how much the man knew of the past, whilst he felt that the last hope of attaining peace of mind was being dragged away from him.

'Look at this, then, and read it if you can. If you cannot, I will do it for you; and when you have heard it, say if Jack Wolton's brother can marry your daughter.—Poor Lizzie, poor Lizzie! I do wish there were any way of sparing you.' The last words were spoken to himself, as he took from his pocket a faded sheet of notepaper and placed it on the table before Edwards. The latter looked down at it, but did not touch the paper.

'Can you read it?' continued Corbet. 'My mother only showed it to me when I came to London a few weeks ago, and told her that I was to marry the daughter of Richard Edwards of Sheffield without her father's consent. She tried first to dissuade me on the ground that it was wrong to oppose your will. Finding that argument failed, she told me the whole sad story, and gave me proofs, through one of your Leeds friends, that Richard Edwards was the name Ned Altcar assumed when he settled in Sheffield.—Read this letter, and then say whether I am to explain personally to your daughter why I cannot make her my wife; or you will accept the sacrifice I am prepared to make in allowing her to think me faithless, rather than that she should know her father's fortune was made out of the money he received for delivering up my brother—his friend—to the hangman?'

Edwards did not reply, and he tried to avoid the letter, which lay on the table before him in the full glare of the gas, for he fancied that he would see, not writing, but Jack Wolton's face! A kind of mesmeric attraction overcame his will, and he looked. The penmanship was well known to him; and whilst his eyes were riveted on the paper, he did not seem to read, but to hear his old friend's voice speaking the words.

The letter had been written in the condemned cell, and there was a manly resignation in the tone of its contents. First, there were expressions of regret for the shame and sorrow his fate would entail upon mother, brothers, and sisters; then the assurance that he was content—nay, glad that the end was so near. He had suffered so much torture of mind during the days and nights he was hiding from the police, that his arrest was a relief to him. Next came the words which stood out from the rest like letters of fire to the eyes of the man who was now looking at them:

'Don't blame poor Ned Altcar. He was in sore straits; and he did try hard to warn me of my danger, and I would not heed him. He was in a state of actual starvation, and the temptation of such a big sum as they offered for me was too much for him. Poor chap! I hope the money will bring him luck. I bear him no grudge; but rather think he has done me a service, for I could not have lived, haunted by the face of that dead man, scoundrel though he was.—Ned does not know that I saw him lurking behind a bush in the garden as the constables took me away; but I did, and understood who had brought them upon me. Leave him to think that I died in ignorance as to who earned the blood-money.'

Edwards was cold and hot by turns; but the words, 'I bear him no grudge—he has done me a service,' sounded like a loud pean of joy in his ears. He was forgiven—he was pitied, excused, and almost thanked! Jack had been glad to escape from the torments of remorse; and Jack had been right; for Ned Altcar had learned during the last twenty years that 'riches fineless are poor as winter' to one whose conscience is not clear. He would give the whole world to be back again in the poverty-stricken cottage; to have all the horrors of starvation to endure, and all the agony of seeing his mother perish for lack of the necessities which she required, if he could only feel that his hands had never touched blood-money!

The fiends had mocked him with riches, piled them upon him until he was surfeited; but his mother had not been saved; his sister had not been spared, and he had found no pleasure in anything. His touch withered everything that might have given him gladness, and only the cursed gold came dancing into his coffers, laughing and jeering at his misery.

But Jack had forgiven him, and in that thought he experienced the first thrill of joy he had known since the horrible night on which he betrayed his friend. And now, what was to be the next step? Was he to accept the sacrifice Jack's brother was willing to make on Lizzie's account, or was he to absolve Corbet from all blame by telling her the truth? It might be some atonement, but it was hard to make. He had believed that his secret was safe in the archives of the police, and he had hoped that she at any rate might never know it. The question thrust itself upon him: 'In which way will she suffer least? Will she find least pain in the revelation of what I wanted to hide from her, and have so striven to hide, or in believing her lover false?'

He clutched at a straw in his despairing eagerness to keep his present place in her thoughts. There was a possibility that Corbet might be only taking advantage of this discovery in order to break off the engagement for some other reason. But the straw was instantly cast away, and he spoke gloomily: 'You say that your feelings towards my—towards Lizzie are unchanged?—that but for this letter, you would still have married her in spite of me?'

'Yes,' was the low and earnest answer. 'I have changed in no way towards her, and what I am willing to let her think of me, should satisfy you on that score.'

Edwards walked across the room: his tongue and lips were parched, and he could not speak.

He took a glass of water, and again confronted his visitor. 'Perhaps I can help you out of the difficulty,' he said hoarsely, 'and spare Lizzie the bitterness of thinking that you had jilted her.'

'It is impossible,' rejoined Corbet regretfully.

'You see that your brother forgave Ned Altcar, and thought he had done him a service.'

'That cannot matter to me: the knowledge that she is your daughter must part us. She herself would be the first to say so.'

'She need not know.' This was uttered questioningly; and the speaker's brows were knit as if with pain whilst he watched the effect upon the hearer.

'Enough. I cannot discuss this matter further. I leave you to decide for yourself whether she is to blame me for what I have done, or to learn to forgive me through your confession.—Good-night.'

He was going; but Edwards motioned him to stay, and presently found voice again. His words came slowly, as if each one gave a separate wrench at the man's heart. 'If you are honest in saying that there is only the one cause for your desertion of Lizzie, I can remove it.—She is not my daughter.'

'Not your daughter!' ejaculated Corbet, astounded, and for a moment experiencing a thrill of relief. But the feeling was only momentary. As he looked at Edwards, and noted the painful quiverings of his pallid features, he doubted the truth of the assertion, whilst he pitied the father who made this desperate move in order to secure his child's happiness.

'I see you doubt me,' Edwards proceeded, more calmly than he had last spoken, 'and I am not surprised. But if your mother has told you everything, she has told you about the cause of Jack's misfortune.'

'Yes; it was the falsehood of Percy Arnold to the woman Jack loved.'

'True; and that woman was the mother of Lizzie.—Sit down, and I will explain.'

Corbet obeyed, but Edwards remained standing. He seemed loth to begin the promised explanation, and once more moved gloomily from one end of the room to the other.

'I did not think it would ever become necessary to make this statement,' he said; 'but as I believe Jack would have wished me to make it if he could have been here, I submit. Ever since that night, I have attempted to do whatever it seemed to me he would have liked to have done. My first step was to find Lizzie Holroyd; and after a time I discovered her in Harrogate, in a state of poverty such as I had known. Her father had refused all help; and the Arnolds would do nothing but heap scorn upon her, as the cause of Percy Arnold's death. They were a callous lot, and had no pity for the poor girl whose life had been spoiled by their son. I saw to her comfort; and when she died, I had the infant Lizzie brought up as my own child. All this was done because Jack would have wished it; and in so doing, I hoped in some measure to atone for my—well, let me say it out—my treachery.' He clenched his lips and hands, staring before him into space. He was looking back, and all the scenes at which he only hinted in his words were passing before his mind's eye with agonising vividness.

Corbet listened in wondering silence, and with rapidly increasing faith in the truth of what he heard.

Edwards roused himself, and continued: 'I wanted the child to grow into a woman accomplished, talented, and beautiful. She has fulfilled these hopes; and more than that—she, believing in our relationship, has been fond of me, and compensated for the loss of my own children. She has been dutiful in every respect except in regard to you. I had vicious thoughts of raising her by my wealth to a position in which her success would humiliate the Arnolds, and make them regret the cruelty with which they had treated her mother. You spoiled that idea. But I desired most of all that she should be happy, and living in ignorance of the past, still regard me with affection. I prayed that this might be granted to me—that she would remember me kindly when I had gone away.'

Corbet was moved by something more than pity now. He felt sorry for the man whose life had been outwardly a brilliant success, and in reality a bitter failure in all that makes life precious. He had no longer the faintest doubt that Edwards had spoken the truth, and he responded with some emotion: 'I am glad you have made me your confidant, and Lizzie shall be happy if it is in my power to make her so. This will be the one secret I shall keep from her—that you are not her father, and that includes everything you wish to be buried in the past. But—neither she nor I will ever touch one farthing of your fortune.'

'So be it,' said Edwards, sitting down exhausted and satisfied.

People wondered at the hasty marriage at Riving Hall of the great heiress to the young engineer. They wondered still more when the newly united couple started immediately for South America, not on a mere honeymoon jaunt, but for a sojourn of several years. Of course the newspapers duly announced that George Corbet, C.E., had obtained an appointment of great importance in connection with various railway and canal projects. In their absence, the wonder was directed to the father of the bride. His conduct was so strange that people began to suspect that the lucky Edwards had taken to excess in liquor, or had lost his wits in some other way. It soon became known that he was losing money even faster than he had gained it, in rash speculations on the Stock Exchange, whilst he was giving away larger sums than ever to charities and hospitals. The final proof of his insanity was seen in the announcement of the sale of all his property in order to satisfy his creditors. The creditors were paid; and a sufficient surplus was left to give Edwards a small annuity and a cottage in which to end his days. There were not wanting sneers from those who had envied him in his days of triumph, and who declared that they had always said as he went up like a rocket, he would come down like the stick.

But Ned Altcar in his cottage was again at peace; and on the return of Lizzie and her husband with their two children, he welcomed them to his humble home with a smile full of such pleasure as the daughter had never seen

on his face before. Corbet kept his promise; and his wife never knew her supposed father's secret, or the way in which he had brought her lover back.

### THE RECENTLY DISCOVERED TOMB-TEMPLES AT SIDON.

THE news has just reached us of the discovery of a very perfect and beautiful Greek tomb-temple near Sidon. The American missionary, the Rev. W. K. Eddy, is the happy finder of it; and from his account, it may very likely prove of value both artistically and archaeologically. His observations were made hurriedly and under difficult circumstances, and it will be the fortune of others to be able thoroughly to explore and bring to light the treasures of this temple, but to Mr Eddy belongs the honour of having found it out. It lies about a mile from Sidon, towards the north-east of the town, and is reached by a shaft thirty feet square and from thirty-five to forty feet deep. Apparently at this depth, Mr Eddy and his excavating party came upon four doors, made in the perpendicular wall, and leading into four different chambers, the doors being opposite each other. They entered the south room first, and there found a chamber about fifteen feet square, cut out of the solid rock. In this, standing side by side, were two sarcophagi, one with a peaked lid and very plain, of black marble; the other, of immense size, and of the most beautiful white marble. This latter sarcophagus was eleven feet long, five feet wide, and twelve feet high, and was constructed of two solid pieces of marble. The top formed an arch, which was divided into two panels at the back and front. From the sides sprang four lions' heads. On each panel, with uplifted wings and facing towards each other, was an animal with the head of an eagle. On the front was a fallen warrior struggling to defend himself by a shield from two centaurs. The sides were also covered with figures of horses, human beings, a hyena, and other animals. At the back were birds with extended wings, but with men's heads—centaurs again; and a band of figures—evidently a hunting scene. Of course the tomb had been rifled, though not much damaged; and three skeletons and five long-nosed dogs' heads were all that was found in it.

In the eastern chamber were also two sarcophagi—a small, very simple one, and another larger and more ornamented. This chamber appeared to be a lovely little Greek temple, constructed of white marble, and described by Mr Eddy as 'translucent as alabaster.' The roof slants, and has tiles represented in carving upon it, 'strips of metal covering the joints, and pretty carved knobs where these strips crossed the ridge.' This temple appears to be full of carving, and, wonderful to relate, in perfect preservation. The body of the chamber has a 'porch of columns' all round it, and between these stand eighteen little statues of white marble, each about three feet high, looking as bright and fresh as if straight from the artist's studio. Upon the upper part of the sarcophagus is represented a funeral procession, the car with the body resting upon it,—some figures expressive of deep grief—and two riderless horses. Needless to say, this tomb also

has been robbed, the top right-hand corner of it having been broken open for that purpose.

The north chamber contains one plain sarcophagus.

In the west room are four sarcophagi, one of which appears to be very beautiful indeed. It is made of marble like the others, and covered over with sculptured figures coloured with paint, and many exquisite designs. In fact, it seems to be a perfect specimen of the highest Greek art.

Apparently, there are no inscriptions to tell us who built these tomb-temples, or whose bodies were here laid to rest amid such artistic surroundings. Judging from the money which must have been lavished upon them, they were the burying-places of persons of rank and wealth; though why one or two of the sarcophagi are so extremely plain it is difficult to say. We can only hope that the party gone, with Professors Porter and Fisher, from Beyrout to thoroughly inspect these tomb-temples with magnesian light will find a clue to their history. It cannot fail to be most interesting, and we are eagerly waiting for their report.

### A LEGEND OF KUNAI.

MANY years ago, when I was in the army, my regiment was suddenly ordered to India. We were stationed in the Bengal Presidency. Shortly after our arrival in the country, when I was quite a 'griff,' I was sent with a detachment of men to a place called Fort Kunai, situated on the banks of the Ganges. At that time this was one of the most dreary stations I have ever been at. Everything about it reminded one of its past greatness, which contrasted painfully with its present desolation. It was built on a small hill, at a point where the river takes a sudden bend; and from our quarters, the Ganges could be seen wending its way for a considerable distance on each side.

At the time that I was stationed there, the only European inhabitants consisted of the colonel commanding, the *padré*, the doctor, and myself. Shortly after that, the colonel went on leave, and I took over command. Then the *padré* was ordered to another station, and his duties also devolved on me. Finally, the relief of the doctor was ordered; but as I was not skilled in medicine, another was to replace him. The doctor had two very nice spaniels that I had taken a great fancy to; and as he did not wish to take them away with him, he presented both of them to me shortly before he left. I must tell you that, in India, the man who usually looks after one's dogs is the *mahter*, or sweeper, a man of very low caste, or perhaps of no caste at all. These men often become absurdly fond of the animals under their charge; and Tajoo, the doctor's sweeper, was no exception to the general rule. The parting between him and Beauty and Bouncer was most affecting. Lest they should get away and follow him, I shut them up in the one remaining room of the old palace in which the rajahs formerly used to live. It was an odd-looking room in its way, and no one lived in it then. It was approached by a flight of well-worn stone steps, and was probably used in former times as a lookout tower. The

floor consisted of large flagstones; the walls were of solid masonry, about three feet thick; the roof was vaulted. There was at that time but one small window—the rest being walled up—and that looked on to the Ganges. A metal ring was fastened into one of the flagstones, and to this I tied the dogs.

The next day, Tajoo came to my room in a state of considerable excitement. He had brought a note—or *chitti*, as they call it in those parts—from the doctor for me, and had evidently noticed something on his arrival which exercised him greatly. In the intervals between his numerous salaams, he wrung his hands and jabbered away in a most incomprehensible manner. I occasionally detected the words *kutta* and *kutti* in his incoherent ramblings, so knew that he must be saying something about the dogs, that word being the Hindustani for dog. More than that I could not understand. In perplexity, I sent for my moonshee. After an animated dialogue between Tajoo and himself, the moonshee then told me the cause of Tajoo's grief. It was a long story, full of eastern hyperbole; but I shall endeavour to condense it as far as possible, adding, where necessary, facts that afterwards came to my knowledge.

It appears that in the days of the East India Company, some soldiers, while out shooting, were met by a party of villagers in the neighbourhood of Kunai. A quarrel ensued, which was followed by a fight, and a European was killed. The quarrel arose out of the Europeans having killed a peacock, which is a sacred bird in that part of India. The villagers took refuge in the fort. The Rajah of Kunai was called upon to give them up to justice; but he, secure in his fortress, bade the messengers return and tell their sahib to come and fetch them himself—if he could. Only one result could follow such a reply. The East India Company had long cast an envious eye on this strong and powerful fort. This was an opportunity not to be neglected. An army was sent to subdue the imperious Rajah, and his territory was proclaimed. The fort was soon besieged. Without adequate artillery, it seemed as if the besiegers would succumb to the effects of the climate long before the besieged were reduced by starvation.

For many weary months the siege went on. Kunai would never have been taken had there not been a traitor within its gates. The Rajah had a lieutenant, by name Muttri, in whom he placed the greatest confidence. Though Muttri feigned the utmost devotion for his lord, his heart was black with treachery, for he had dared to lift his eyes to the beautiful Raneé, and he loved her. Day and night he cherished his passion, and thought how he could make her his own. All the favours that he owed to the Rajah's generosity were forgotten. Love alone for the Raneé burned in his soul, absorbing every other passion. At last a plan suggested itself to Muttri's mind by which he thought he could gain his ends. Amongst the garrison were certain relatives of his own. He took them into his confidence, and the promise of a large reward made them his devoted tools. That night, when all were at rest except the sentries, a swift messenger left the fort for the English camp. He returned unperceived, and was admitted by

Muttri. The reply he brought was favourable. Muttri's black eyes gleamed with savage delight. Alas for the poor Rajah! There was no one to warn him of the diabolical scheme on foot.

A few nights afterwards, Muttri and his friends were all on guard at the principal entrance to the fort. While the Rajah was sleeping in fancied security, stealthy steps approached; the gates were silently opened; one by one the English soldiers crept in, and still the Rajah slept. Then came a sudden shout, followed by a heart-rending cry. One of the soldiers on guard at the palace, within the citadel, had seen the intruders, and gave the alarm at the same moment that he received his death-wound. Then, in that still night, followed the din of war and the clashing of arms, confusion and dismay. The victory was not a bloodless one, for the Rajah, at the head of a few staunch adherents, fought desperately, with all the courage of despair, while the Raneé, with her young child, was being lowered from the walls overhanging the river. She escaped by way of the Ganges. Shortly afterwards, her gallant lord fell mortally wounded.

In the morning, the English were masters of the fort. The heads of the villagers who had killed the European were hung over the gateway by which they had entered. War in those days was a much more savage game than it is now. Then Muttri claimed the fulfilment of his compact, which was, that his life and those of his friends should be spared; also, that he was to be left in command of the fort. The English were in such sore straits when they were offered these conditions, that they were only too glad to accept them; so they retired, and Muttri ruled in place of his master. But with him, power was only another name for tyranny. Having committed one crime, he tried to drown the reproaches of his conscience by still further excesses.

The Raneé in the meantime, hearing that the English had withdrawn, collected a great force and led it in person on Kunai. On her arrival, the gates were joyfully flung open by the garrison; the traitor Muttri was made a prisoner by his own servants. He was brought before the Raneé to receive the sentence that his perfidy deserved. Before she could utter a word, he flung himself at her feet and poured forth his tale of love with all the ardour of a pent-up passion suddenly broken loose. His story made his traitorous act appear doubly black. The Raneé heard him in severe silence; then a smile of bitter scorn curled her lips, and she briefly pronounced his doom. Muttri was a brave man; but even he shuddered to hear his fate. At a sign from the Raneé, he was removed. The Raneé had decreed that never from that moment was he to taste water or other liquid again.

He was taken to the room that I have described as being now the only one of the old palace left standing. There his terrible sufferings soon began. Chained to the ring in the flagstone that still remains, his chain was just long enough to admit of his dragging himself to the window to watch the Ganges flowing ceaselessly by. He could hear it rippling and gurgling as it passed, while his parched lips hungered for a few drops of the precious fluid. His sufferings were beyond all description; but the Raneé's heart softened not. Savoury-looking dishes were placed before him;

but they were only temptations to be resisted, for in the sauce of all was brine. As the end drew near, Muttri's ravings made the night seem hideous. His bloodshot eyes, swollen tongue, lacerated lips, and haggard features made him a spectacle awful to behold, as he crouched by the window and watched the waters of the Ganges flowing by, and shrieked out the single word *Pani, pani, pani!* (Water, water, water!) The word *Traitor, traitor, traitor!* seemed to come back in mockery as an echo. At last, one gloomy midnight, his fearful torments ended in death. None mourned his fate.

At dawn next day, the following legend was found, scrawled in letters of blood, on the wall of his prison:

Whatever sleepeth here again,  
Shall ne'er a year its life retain.

The servants read the words, and trembled; the Ranee heard them with a shudder.

Muttri's head was severed from his body, and hung over the gateway that he had surrendered to the English. His body was flung into the Ganges for the alligators to devour.

Neither man nor beast was again allowed in the room in which he died; yet, at night, the servants would start from their sleep and huddle together in fear, declaring that they heard wailings and unearthly moans coming from that deserted chamber. The natives are a grossly superstitious race, and they fully believed in the potency of the writing on the wall to do them evil.

A few days after Muttri's death, the Ranee's only child escaped from its nurse, and wandering about the palace, came at last to this ill-fated room. With child-like curiosity it entered and began to play about on the floor. Tired at last of playing, it lay down on a mat and fell asleep. When the frightened nurse found him, the boy was dead. One hand was grasping the ring on the floor, and the other was held over his eyes, as if he was endeavouring to conceal some awful object from his sight. When the news of this death spread in the city, the superstitious populace repeated to each other in awestruck tones the prophecy that they had heard was written on the walls. The fulfilment in this case had followed quickly on the event. No man would henceforth dare to doubt it.

The Ranee and her followers once more fled from Kunai. The palace was allowed to crumble away in ruins until the English again took possession of the fort.

Such was the story that the moonshee related to me. It was easy to see, from his tone, that he fully believed it. The sweeper, he said, feared lest the evil *rackshus* (demon) who inhabited the room would come some day and steal away the lives of the two dogs. I tried to reason with both of them; but a people steeped in superstitious lore are deaf to all reason. 'Allah,' the sweeper said, 'had willed that it should be so. The ways of Allah were inscrutable.' He besought me to remove the dogs at once. At last, in order to get rid of him, I promised to do so. He left me full of forebodings that some evil awaited his pets.

Shortly before I left Kunai, one of the two dogs, Bouncer, went mad, and had to be de-

stroyed. I thought very little of this at the time, as the heat was very excessive, and dogs often went mad at that period of the year.

A short time after Bouncer's death, I was relieved by another detachment, and returned to the headquarters of my regiment, taking Beauty with me. Slowly the year went by; the hot weather gave place to the monsoons, which were heralded as usual by some heavy dust-storms—an extraordinary sight to those who see them for the first time. Then the monsoons yielded grudgingly to the winter—delightful months as long as they last. Once more the summer burst upon us, hotter and more shrivelling, if possible, than it had been the previous year. One special Sunday—I remember it well—the heat was almost suffocating. During the early morning church parade, several men had to 'fall out.' Yet the irritating movements of the punkah, as it passed backwards and forwards before my eyes, made me feel so giddy that I could hardly endure it. In the afternoon, I went for a ride. Beauty wanted to follow, as usual; it was so hot, however, that I would not take her out. It was a little after sunset when I returned. On the doorstep was Beauty, anxiously watching for us, she and the pony being great friends. She barked joyously, and ran across the compound to meet us. As I was to dine with some friends that evening, I entered my bungalow and began my toilet at once. A few minutes afterwards my sweeper rushed into my room in great consternation, and cried out: 'Sahib, sahib, the dog is dead!'

I ran out, and there she lay panting in the veranda. I dashed a bucketful of water over her; it did not revive her in any way. In a few moments she had breathed her last. A few minutes before, she seemed full of life; now, she was dead. Suddenly the prophecy in connection with the room at Kunai occurred to me. I sought my diary, and turned over the pages to the date on which the two dogs had been given to me. April—May—June. Yes, there it was, June 17th—a year that very day! Both dogs had died within the specified time.

I thought over this curious coincidence on my way to dinner, and was not a little disturbed at it. During dinner, I was rallied on my silence, and, by way of excuse, related to my host the legend of Kunai, and the strange fulfilment of the prophecy that very night. I had hardly concluded, when my *khidmutgar*, who was standing behind my chair, started forward and shouted: 'Sahib, sahib, deko!' ('Sir, sir, look!') His black face was almost blanched with fear, as he turned and fled from the room, his snow-white *puggaree*, which had tumbled off in his haste, streaming behind him.

I looked in the direction in which he had pointed. I, too, was startled. Outside, on the lawn, I saw through the glass door the full outline, clear and distinct, of the dog that I had just left dead at my bungalow. Unearthly, unreal, it appeared, as it stood rigid and motionless, the rays of the full moon falling upon its form. Its eyes, which glowed like coals of fire, seemed to look a mournful farewell at me. I rubbed my eyes and looked again. In that moment, the spectre had melted away in the dim shade. I could see nothing. Was I awake, or was I the victim of a dream, or

was this but a freak of vision? I looked at my host in blank amazement. He had seen nothing. I was about to explain, when—a yelp and a cry, and Beauty herself came bounding into the room *in propria persona*. No ghost this time, but solid flesh and blood. She had only had a fit, after all, and recovered shortly after I had left my bungalow. My sweeper had followed me with her, to show me that she was still alive.

We laughed heartily over the occurrence, and it was a long time before my 'Legend of Kunai' was forgotten in the regiment, for the story soon got wind. Beauty lived for many a year after that. When she did die, it was of a prosaic disease called old age.

### THE MONTH: SCIENCE AND ARTS.

WHAT is described as 'the severest and longest earthquake that has been felt in Japan for many years,' occurred in January last, and extended over a land area of more than twenty-seven thousand square miles. Happily, the disturbance did not reach the dimensions of a catastrophe, and although many buildings were injured, there seems to have been no loss of life. But the university authorities at Yokohama, with praiseworthy promptness, at once sent a native expert, Professor Sekiya, to report upon the occurrence, with a view to adding to a branch of knowledge which is more cultivated in earthquake-ridden Japan than in any other country of the world. The professor went about his task with that thoroughness peculiar to Japanese workers; and six weeks afterwards read a paper upon his researches before the Seismological Society. Most Japanese earthquakes have been attributed to the underground explosion of steam; but this is believed to have been due to a sudden faulting or dislocation of strata. The buildings in Yokohama were knocked about terribly, those which stood on soft artificially-made soil suffering far more damage than those built on solid ground. In Tokio, the shock was not so severe, and here many observations were made with regard to the nature of the earth-motion. Professor Sekiya's Report is a most valuable addition to the scanty literature of seismology.

The burning of the Opéra Comique at Paris, with its hundred unfortunate victims, partakes more of the nature of a crime than an accident. Within recent years, science and ingenuity have contrived all manner of methods for dealing with and preventing conflagrations. Curtains, hangings, and garments, those of ballet-dancers especially, can be made fireproof with the greatest ease and with little expense; woodwork can be coated with unflammable paint; canvas can be dressed with waterglass, and so protected from fire; and last of all, buildings can be rendered unflammable as a whole. But, in spite of all this acquired knowledge, things are allowed to remain as they did of old. The inventor has worked in vain, for the results of his labours are not adopted. In the case of the Opéra Comique, a very heavy responsibility rests upon the Fine Arts Department, under whose control the building was placed. Six years ago, and

often since, have they been warned of the risks to which this particular theatre was by its construction exposed; but they took no heed.

The beautiful optical instrument called the stereoscope, by which two pictures taken from slightly different standpoints are made to blend into one image, has hitherto been regarded merely as a pleasant manner of examining photographs, and, most unaccountably, it seems to have gone completely out of fashion. According to a French paper, it is made to fulfil a very useful office at the Bank of France, it being employed there for the detection of spurious bank-notes. For this purpose, a genuine note is placed side by side with the suspected one inside the instrument; and when the two images are superposed, the slightest difference between them becomes at once evident. It is said that a forged note which appears perfect to the unaided eye cannot bear this stereoscopic test.

A striking instance of the danger of neglecting sanitary laws in building construction has recently been exemplified at Paris, where three members of one family narrowly escaped death from poisoning by undiluted sewer gas. A broken drain-pipe allowed this gas to issue without hindrance into the sleeping apartment of this family, with the result that one morning they were found insensible in their beds. A search soon led to the discovery of the broken pipe. In this case, the effects were sudden and serious, and the leakage was discovered in time; but we know that there must be thousands of cases in which this sewer gas is working silently and with deadly effect, although its effects may be spread over years rather than hours. In our own cities and towns, these matters receive more attention than they did a few years back; but in Paris there is still much room for improvement.

The Report of the Registrar-General for the past year contains much upon which the modern dwellers in the metropolis may congratulate themselves. The death-rate, 19.90 per thousand inhabitants, is four and one-fifth less than that of either Paris or Berlin. In the year 1840, London had the same death-rate as that which Paris has to-day, so that it will be at once seen that there has been a distinct improvement. The chief factor in the welcome improvement is the great reduction in cases of death from zymotic diseases, such as scarlet fever, typhoid fever, and smallpox; and we may be almost certain that if the general public were as careful in their sanitary arrangements as they might be, and as some few are, such diseases would in time be entirely stamped out. It is a triumph for those who believe in the benefit of vaccination, and the reverse for those fanatical individuals who do their best to combat legislation in this direction, that in London, last year, there were only twenty-four deaths from smallpox. Let us remember that there are many now living, and who have hardly reached middle age, who can remember how common it was in our metropolitan streets to meet with persons who were horribly disfigured by this terrible scourge. It is now happily an exception, rather than the rule, to meet with such unfortunates.

Lord Mount Temple has recently called the attention of parliament to the regulations for the prevention of hydrophobia. He thinks, with many other persons, that the muzzling of dogs

is both injurious to the animals and inefficient for the purpose of preventing the spread of the disease; but his opinion is not borne out by a reference to statistics. Two years ago, 'rabies' rose to such an extent in the metropolis that one veterinary surgeon alone treated seventy-seven cases; and in the same year twenty-eight people died of hydrophobia in and about London. After the police regulations with regard to muzzling were put in force, the cases fell to an insignificant number; and we have a further proof that this method of dealing with the matter is an effective one, from the fact that in Berlin—where formerly hydrophobia prevailed to an alarming extent—its adoption has almost eradicated the disease. There is no reason to fancy that a properly constructed muzzle upon a dog's mouth is as disagreeable or more injurious than a respirator on that of a human being. But it is a curious feature of civilised life that many good people feel more for the sorrows of domestic animals than they do for those of their fellow-creatures.

The astronomical Conference which recently sat at Paris, at the invitation of the Academy of Science, has agreed upon a plan to be generally adopted for charting the heavens by means of photography. The President chosen was Admiral Mouchez, the Director of the Paris Observatory, who, by the way, has recently published an illustrated manual giving some very interesting particulars with regard to the astronomical photographs obtained at that establishment. The committee formed to consider the kind of instrument to be employed in this national work have decided upon apparatus identical with that which has been employed with such success by the Brothers Henry in Paris. The limit of the magnitude to be recorded on the photographic plates, each of which is to be in duplicate, is that known as the fourteenth. It is calculated that the exposure of each plate will be twenty minutes; but this will give very little indication of the time which will be required to carry the entire work to completion, for there are many nights when the light of the moon or the state of the weather will render photography impossible. Seven observatories, four of which are French, have already signified their intention of joining in this work; and there is little doubt that every observatory of note will ultimately take part in it.

Although Professor Tyndall has been obliged reluctantly to retire from the professorship which he has held and adorned for so many years at the Royal Institution, it is satisfactory to know that his services will not yet be lost to the public. It is stated that he now hopes to devote his time to original research; and those who are aware of the useful work that he has already done in this direction, will look forward to the benefits which will most surely accrue to science from the efforts of his busy brain.

In the United States, electric trams and railways are becoming common, for there are at present twenty-three towns in which this mode of locomotion has been adopted; and there are almost as many places where arrangements are being made for lines on the same plan.

The Turners' Company again offer prizes for the best specimens of hand-turning in wood, glass,

&c. In awarding the prizes, the following qualities of the work will be taken into consideration: (1) Symmetry of shape, utility, beauty of design, and general excellence of workmanship. (2) Copying of any object so that it shall resemble exactly the copy in shape and capacity, and so on. (3) The fitness of the design and the way of carrying it out for the purpose for which the article is designed. (4) Circular and oval turning. (5) Novelty in design or application of the lathe. (6) Carving and polishing, which, however, must be subsidiary to the actual turning of the work so decorated. Amateurs will be allowed to compete in a special class, and it is almost certain that professionals will find among them some adversaries who will be very difficult to beat.

From time to time during the last thirty years, it has been proposed that capital punishment should be supplanted by means of electricity. If we remember rightly, Dr W. B. Richardson performed some experiments in London about twenty years ago, showing that by means of a powerful current, sheep and other animals could be instantaneously and, as far as can be judged, painlessly killed. The Senate of Pennsylvania has lately passed a Bill providing for the infliction of death punishment by this means. There are several difficulties surrounding the subject, which any electrician will at once acknowledge, but these lie chiefly in trusting such a terrible power to unskilled hands. If death punishment be an actual necessity of civilised life—which many people doubt—it should most certainly be carried out in the most humane manner; and perhaps the electric power would be the best means of accomplishing this end. It is probable, too, that the mystery attached to it in vulgar minds might have a deterrent effect upon the criminal classes.

A new method of bookbinding has been introduced. This consists in the employment of sheet-metal for covers, in lieu of the millboard or card which ordinarily forms the foundation to which the leather or other material is attached. The metal employed is very thin, and can be bent and straightened again without damage. For school-books, hymn-books, &c., which are subjected to much wear and tear, this method of binding is said to be very useful and efficient.

A correspondent of an American paper—presumably a doctor—advises those who wish to gain flesh and strength to assimilate oil through the pores of the skin, instead of by the stomach. The patient is to take a warm bath, so as to thoroughly open the pores of his skin. He must then be rubbed dry with rough towels in a heated atmosphere, after which, any pure oil is rubbed into the skin. Cod-liver oil is said to be the best; but olive oil will do. By this means, it is said that an invalid will be able to assimilate ten times more oil than his weak stomach could possibly digest.

During the current summer, a class will meet at King's College for the purpose of a course of instruction in bacteriology. The object of this class is that those attending it may receive a practical knowledge of the more important micro-organisms which are now known to scientists, and for the purpose of studying the methods by which their presence may be detected. This class

will be under the care of Mr Cruikshank, who has recently returned from a visit to various continental laboratories, where prominence is given to this important branch of physical research.

The St Mungo Chemical Company of Glasgow has adopted a new method of making white-lead, by which the manufacture is robbed of its usual pernicious effects upon the health of the workmen employed. From first to last, the material is not handled, but is put through its various stages by automatic machinery. The Company also manufactures a special white pigment which is said to possess all the advantages of genuine white-lead, and to have actually better 'covering' power. It will mix well with other colours, and is not poisonous.

The applications of electricity to operative surgery are continually being added to, and perhaps one of the most important is represented by the electro-osteotome, recently invented by Dr M. J. Roberts of New York. This instrument enables the surgeon to perform what was before a very difficult and tedious operation with mathematical nicety and in very brief time. It consists of a small circular saw, which revolves at a great speed by the aid of an electric motor. Its purpose is to remove portions of bone, when that course is rendered necessary by disease or deformity. Such operations have before only been possible by very clumsy methods, which were more akin to carpentry than to surgery, for the operator employed a modification of the chisel and hammer. With the new instrument, such operations can be not only done in a far more scientific way, but with far less shock, and therefore less risk to the patient.

The manufacture of paper bottles is said to be becoming an important industry at Chicago, and the process adopted is that invented by Mr L. H. Thomas. These paper bottles, which can be made of all shapes and sizes, are cheaper than those made of glass or other material, although, from the published description of the process, this would hardly seem to be possible. A sheet of paper cemented on one side is rolled on a mandrel, after which the neck is fashioned, and a bottom of paper or wood inserted into the cylindrical vessel. An outer glazed-paper covering is next added; and the interior of the bottle is lined with a fluid composition, which speedily becomes hard, and resists alkalies, acids, spirits, and everything else. The bottles are unbreakable, and require no packing in transit. For various purposes, such as the carriage of ink, blacking, varnishes, and paints, these bottles will doubtless be found useful; but for wines, spirits, medicines, &c., glass, which has the advantages of transparency and great cleanliness, is likely to hold its own.

The disease among the silkworms which has lately threatened to ruin the silk-trade of India, has hitherto defied every remedy which has been tried. A number of infected cocoons have now been sent to Paris for examination by M. Pasteur and his pupils, and it is to be hoped that they may be able to discover some method of successfully combating the disease.

The slag which results from making steel by the Thomas-Gilchrist process, and which was once regarded as a waste product of no value, was found, by experiments conducted in Germany a

few years ago, to possess valuable manurial qualities. It contains both iron and phosphorus, the latter in the form of phosphoric acid. The results obtained in Germany have been fully confirmed by more recent experiments in this country. It is found that when the slag is reduced to a fine powder and is used as a top-dressing, it has a very beneficial effect upon the crops grown on the soil so treated. As we have recently stated in these pages, the use of sulphate of iron alone has been of great advantage to certain crops; and it is thought that the presence of the same agent in this slag may have something to do with the recorded results of the use of that material.

A correspondent of the *Times* calls attention to the fact that the Red Sea, which forms the great highway to the East, is so badly lighted that wrecks are common upon its shores. He tells us on the authority of the best chart we have (Imray's) that captains of vessels have to exercise the greatest caution because 'the Gulf of Suez is but imperfectly surveyed. The currents are irregular. Owing to the prevalence of mirage, the eye cannot be relied upon in judging of distances; and for the same reason the character of the horizon is so deceptive, that the accuracy of solar observations is open to doubt.' At present, he tells us that there are not half-a-dozen lights visible in the 'fairway' from Aden to Suez. He looks upon the remedy for this state of things as being an international affair, and believes that if the underwriters of the various countries would take up the matter as a thing closely associated with their own interests, a general system of efficient lights could soon be established.

An ingenious method of ascertaining the 'flashing-point' of mineral oils has for some time been practised in America under the name of the Seybolt process. The oil to be tested is placed in a suitable vessel open at the top, contained in a water-bath. The water-bath is gradually raised in temperature, while a thermometer in the oil records the increase. Just above the surface of the oil, a pair of electrodes are adjusted, which are in connection with an induction coil, so that a stream of sparks is constantly passing from one to the other. At a certain heat, the oil will give off an inflammable vapour, which is ignited by the electrical sparks. The temperature recorded by the thermometer, when this occurs, marks the 'flashing-point' of the particular oil under trial. It is said, however, that this plan is open to error, and that a more accurate method would be desirable.

## OCCASIONAL NOTES.

### THE MESSINA TUNNEL.

A PROPOSAL has been made by Signor Gabelli, an eminent Italian engineer, to construct a tunnel beneath the Strait of Messina from Italy to Sicily. The idea is not a new one, but its revival seems popular in certain circles in Sicily. The length of the work would be about eight miles and a half, and it would be carried at a depth of at least five hundred feet below the sea-level, and would occupy about five years or more in cutting. But the cost is a serious item, the engineer's estimate being three millions sterling! Care has been taken to procure reliable

surveys and careful soundings, and the sea-bottom is reported to be highly favourable for the construction of a submarine tunnel.

Another proposal has been made to connect this island with the mainland of Italy, and that is the construction of a bridge of over nine miles in length to cross the strait. The sea here is often agitated by sudden squalls, peculiarly dangerous, and often very destructive; so that, in all probability, if the scheme for connecting the two shores is ever carried out, it will be by a tunnel under the sea.

#### BRIQUETTES.

The utilisation of coal-dust—technically known as 'slack'—in the manufacture of briquettes has rapidly progressed of late, and the new form of fuel is now frequently met with, not alone for household purposes, but on the more extended scale of industrial undertakings. A briquette is simply an admixture of coal-dust with pitch, moulded under pressure and heat, the latter substance being introduced to form the cementing material. The size most generally adopted is about double that of the common building brick, weighs about ten pounds, and is sold at a cost of one penny each. For household and domestic purposes, the smouldering qualities of the briquette give it especial value; it will remain alight for seven or eight hours, and can at any moment be roused by the poker into a cheerful flame. The heat given out is equal to that obtained from coal; whilst the absence of all smell in burning, and the fact that briquettes do not deteriorate by keeping, form additional evidence in their favour.

The process adopted in the manufacture of briquettes may be briefly sketched. The coal-dust having been thoroughly cleaned by a stream of water from all particles of pyrites and shale, is well dried in a cylindrical tube, previous to mixture with lumps of pitch in a disintegrator, which thoroughly combines the two ingredients, prior to their delivery into a vertical 'pugmill'—a machine similar in design to, though differing somewhat in detail from, the well-known pug-mill of the brickfield. Steam is now introduced into the pugmill, rendering the pitch viscid and adhesive; the mixture, thoroughly amalgamated, then passes into moulds cut in a rotary die. Powerful rams, exerting a pressure of twenty pounds per square inch, force the material into each mould as it passes in rotation beneath; the mechanism regulating the joint action of mould and ram being particularly ingenious and skilful. Nothing further remains but the delivery of each briquette after moulding on to a creeping band, where it is met and cooled by a current of air from a fan, and delivered into a wagon below.

It is stated that several foreign railways have already availed themselves of the advantages attending the use of briquettes, and in this direction unquestionably a large field presents itself. The manufacture of this comparatively new form of fuel is rapidly extending; and colliery owners, under the stress of hard times, gladly turn themselves to a waste product, long regarded as valueless; now rendered serviceable and profitable, and offering every prospect of extended development in the near future.

#### MAKING AN 'INLAND SEA.'

Sir F. de Lesseps has lately communicated to the Institution of Civil Engineers an interesting account of a curious work carried out in Tunis by Colonel Roudaire. This gentleman appears to have spent many years in Tunis levelling, boring, and making experiments of various kinds, and has come to the conclusion that four depressions, or 'shots,' as he terms them, which he names Tedjed, Djerid, Rharsa, and Melrir, and are situated seventy-seven feet six inches below the sea-level, could by means of a canal be readily formed into a large inland sea or lake, which would have the effect of influencing for good the climate and fertility of the surrounding country to a considerable degree. This lake is stated to be three thousand one hundred and sixty-four square miles in extent. In order to prepare for the vast expense which such an undertaking must involve, the colonel proposes to sink artesian wells, for the purpose of cultivating the country; and the rent paid for the water thus obtained might be applied, the whole or in part, towards the construction of the proposed canal. In 1855, the first well was sunk to the depth of two hundred and ninety-five feet, when water was found flowing at an average of seventeen hundred and sixty gallons per minute the first year, which has now increased to nineteen thousand eight hundred gallons per minute. Sir F. de Lesseps says: 'The banks of the river Melah, which fifteen months ago were deserts, are now populated; and very shortly the canal is to be commenced, so that the civilisation of the French African possessions must come from below; that is to say, must of necessity depend for water-supply on wells only.'

#### WAITING.

Once, in the twilight of an autumn day,  
I stood upon a beaten path, that led  
The shepherd lads to where their charges fed  
In pastures high above the upland way:  
Solemn, and lone, and still, the mountain lay;  
And, like a dome above a temple spread,  
The blue sky stretched its beauty overhead,  
With not one floating cloud to preach decay.  
Always—above the hush, through the soft light  
Slow waning—the wide solitude was fraught  
With mystic impulse from the silence caught—  
Half intonations heralding the night—  
That to my heart, awe-bound, conveyed a sense  
Of calm expectancy and questionless suspense.

ALFRED WOOD.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:  
1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'  
2d. For its return in case of illegibility, postage-stamps should accompany every manuscript.  
3d. To secure their safe return if illegible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.  
4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.  
*If the above rules are complied with, the Editor will do his best to insure the safe return of illegible papers.*

## THE COLLEGE OF PRECEPTORS.

THE new buildings of the College of Preceptors in Bloomsbury Square are not unworthy of the largest examining body in the United Kingdom; for none of the universities or great educational corporations can show such an annual total of examinees. Nearly sixteen thousand men and women, boys and girls, were examined by the College during last year. Hitherto, the practical difficulty of finding room for the enormous numbers who present themselves at the various London examinations has proved almost insurmountable. The house in Queen Square has long been ludicrously inadequate for requirements of this magnitude. But in its new home the College is comfortably housed. The hall is spacious enough to seat easily a thousand students at the same time; and it is probable that the operations of this indefatigable corporation will develop into still more huge proportions when it is no longer trammelled for space.

Few people probably realise the work which has been so thoroughly, although so unostentatiously, performed by the College of Preceptors during its forty years' existence. In the examination of teachers alone, it has discharged a duty of incalculable importance. It is one of the many functions of the institution to provide facilities to the teacher for acquiring a knowledge of his profession, as well as to examine and to certify as to his fitness; and in this way it has more than fulfilled the objects with which it was founded. Then the half-yearly examinations of pupils, which is another distinct branch of its work, afford a most useful test of their progress, whereby both teachers and the public can form a satisfactory criterion of the value of the instruction received and given. In this respect, too, the College was a pioneer, for its pupil examinations were founded some years before the institution of the University Local Examinations, and even before those organised in 1856 by the Society of Arts. For more than thirty years, immense numbers of boys and girls have every half-year presented themselves

for examination, while visiting examiners are also appointed by the College for the inspection and examination of public and private schools. Another subsidiary but important branch of the operations of the College is the organisation of courses of lectures on 'the Science, Art, and History of Education.' In 1873, moreover, the Council instituted a professorship—the first established in this country—of the Science and Art of Education as a special subject of instruction. Lessons on the methods of teaching various special subjects are also arranged from time to time, and meetings are held monthly for the purpose of discussing educational topics. There is, too, a library of educational works for the use of members.

Established in 1846, the College of Preceptors was incorporated by royal charter in 1849, 'for the purpose of promoting sound learning, and of advancing the interests of education, more especially among the middle classes, by affording facilities to the teacher for the acquiring of a sound knowledge of his profession, and by providing for the periodical session of a competent Board of Examiners, to ascertain and give certificates of the acquirements and fitness for their office of persons engaged or desiring to be engaged in the education of youth, particularly in the private schools of England and Wales.' The charter declares that the persons whose names are entered in the register-book shall be members of the corporation, and constitutes them one body, politic and corporate, to have perpetual succession and a common seal. The corporation is, moreover, empowered to purchase and hold personal property, and, notwithstanding the statutes of mortmain, such lands, buildings, and hereditaments as may be necessary for the purposes of the College, provided these do not exceed fifty acres. The charter goes on to provide that there shall be a Dean and Secretary and a Council of forty-eight members, of whom one shall be President and three Vice-presidents, and one-fourth of whom are to retire from office annually. The affairs of the corporation are

managed and directed by this Council, which has the custody and control of the common seal.

So much may be said for the constitution of the College, as provided for under the charter. But it would be tedious to detail the curiously exact provisions made with regard to its management; it will suffice to say that so far these have worked well. And so, too, have the bylaws, which provide, amongst other things, that all persons engaged in education who have passed an examination satisfactory to the Council are admissible as members.

We have already indicated the two main divisions into which the work of the College is divided. As to the first, the examination of teachers, it may be added that there are three grades for which diplomas are granted—Associate, Licentiate, and Fellow. The subjects for the diploma of Associate include the English language with special reference to its grammatical structure; the outlines of English literature; English history with special reference to the leading constitutional changes; geography, arithmetic, the theory and practice of education; and either classics, a modern language, mathematics, or science. Candidates for the diplomas of Licentiate or Fellow pass a harder examination in the theory and practice of education, and have to take up two or three respectively of the extra subjects. Women—and it may be mentioned that they now form a large proportion of the candidates at the examinations for diplomas—are allowed to substitute either the theory of music or drawing for mathematics. From all this, it will be seen that these examinations afford a sound test of general knowledge.

It is unnecessary to go into further details as to their scope. It may, however, not be without interest to add that the subjects of examination in the theory and practice of education include mental and moral science, logic, physiology, lesson-giving and criticism of methods, and the history of education. As to the examinations for certificates, held half-yearly at various centres and at schools 'in union with the College of Preceptors,' it may be remarked that they are divided into five classes—first, second, and third, and higher and lower commercial. For the first class there are eight obligatory subjects, including English grammar, English history, geography, arithmetic, algebra, Euclid, Latin, and either French or German, Spanish or Italian, or Greek; and candidates may be examined in not more than five of the following additional subjects: Scripture history, plane trigonometry, mechanics, mensuration, experimental physics, chemistry, natural history, political economy, book-keeping, music, and drawing. The second-class examination consists of six obligatory, and not more than four optional subjects; and the third class, of four obligatory, and not more than four optional subjects; while the higher and lower commercial examinations are the same as those for the first and second classes respectively, with the substitution of a modern foreign language for Latin.

The higher certificates of the College are recognised by Her Majesty's judges and by the General Medical Council, so that the holders of them are exempt from the preliminary literary examinations held by the Incorporated Law Society and by the various medical corporations of the United

Kingdom. All first and second class certificates the holders of which have passed an examination in Latin are, moreover, recognised by the Pharmaceutical Society and by the Royal Veterinary College. In fact, the examinations of the College of Preceptors have come to be regarded as a sort of general preliminary examination, a fact that accounts in some measure for the enormous numbers who avail themselves of their advantages. It is satisfactory to know that the number of girls' schools from which candidates are sent up periodically is now very considerable, and is rapidly increasing. In the case of all female candidates, it should be mentioned that algebra, geometry, and Latin are optional, and may be replaced by any three other subjects.

The College has, indeed, already come to exercise a very appreciable influence upon middle-class education, and in its development will probably become still more influential. In giving cohesion to the individual efforts of private middle-class schools, it has accomplished a great work, the real importance of which has yet to receive the recognition it deserves. Owing to their isolation and their want of co-operation, private schools are largely lost sight of, whereas they perform functions which are every whit as important as those discharged by the great public schools. In the same way, too, so far as female education is concerned, the real value of the work done by the smaller schools is to a large extent dwarfed by the factitious importance which is given to the high schools and colleges.

It should, moreover, be borne in mind that the College of Preceptors has been the first to establish in this country a chair of Education. In the coming time, it may be that educational history and the science of teaching will form a necessary part of a liberal education. But it is not so to-day. Even the very names of many of the great educators have an unfamiliar sound. Sir Thomas Elyot's *Governour*, and Roger Ascham's *Scholemaster*—those two great authorities for physical education—and John Brinsley's *Ludus Literarius*, are almost forgotten books. It is as Provost of Eton that Sir Henry Wotton is remembered, and not as the author of *A Philosophical Survey of Education*. The *Tractate of Education* is the least known of John Milton's writings. Few except educationists have probably even heard of Sir William Petty's *Plan of a Trade or Industrial School*, which appeared in 1647; and Samuel Hartlib's *Propositions for erecting a College of Husbandry* are almost unknown even in these days of agricultural colleges. Of Comenius, who is perhaps the true founder of educational science, it is safe to say that few people know much. Nor has the influence of Pestalozzi and Froebel yet become so highly valued as it deserves. Here, indeed, lies a rich field of study, and this the College of Preceptors has made its own.

Two projects, it should be added, are at the present time engaging the attention of the Council. The one, the registration of teachers, has long been outstanding. As long ago as 1861, a circular of the Council brought a proposed Scholastic Registration Act before the heads of the principal schools in the country, and the plan has not been lost sight of. The second scheme is comparatively new. The Council, now that it has disposed of the building difficulty, proposes to

accumulate a fund from the surplus revenue of the College for the purposes of founding scholarships for intending teachers, and for the establishment of a Training College for teachers in secondary schools. But we have said enough to indicate the wide usefulness of this great educational corporation.

## RICHARD CABLE,

### THE LIGHTSHIPMAN.

BY THE AUTHOR OF 'MEHALAH,' 'JOHN HERRING,'  
'COURT ROYAL,' ETC.

#### CHAPTER XXVIII.—THE WORKING OF THE POISON.

WHEN Richard Cable left the *Anchor*, the hour was not late, but he had drunk more than his head could bear. He had always been an abstemious man; consequently, a glass or two more than what he usually allowed himself greatly upset him. On this sole occasion he had not exercised that self-restraint which was habitual with him, for on this evening the fire in his blood had urged him to slake it. But that was not all. He had felt real pleasure in being once more in congenial society—in society which exercised no thralldom over him, in which he was relieved from the suspicion that he was being watched and criticised. This sense of liberty after irksome bondage impelled him to relax, and for once to forget that there were limits he had been accustomed to set himself. He appreciated the kindness of the men he was with, and he sought to meet them on their own ground, to show them good-fellowship. As the fever in his veins cooled and his wrath passed away, he became cheerful, and for the first time for many days—happy. It is said that children brought up under stern discipline become dissolute when emancipated from parental governance. Cable had been for some time under discipline peculiarly galling, and now that for a moment he was free, he forgot that his liberty was not absolute.

Richard left the *Anchor* on the arm of Jonas Flinders, his brother-in-law. He was in good-humour. 'The yacht shall be rechristened to-morrow,' he said. 'She shall be called henceforth the *Bessie*—that will please my mother; she is Bessie; and the baby is called after her. The best of boats shall bear the name of the best of women and the dearest of babes.'

The air from the sea was cold; it fanned the hot face of Richard. The sky was without cloud. There was no moon, and many stars were visible; not that the sky was crowded with them, as on a winter night, because there was twilight in the heavens; nevertheless, many shined. The evening star twinkled. Sirius turned red and green and gold, flashed and winked like a diamond. The night was so cool, the breath from the sea so fresh, that Richard's hot head seemed to him to steam. 'There is the Big Bear,' said he, leaning heavily on the arm of Jonas, and pointing to the constellation known to every child. 'There

he is turning about on the end of his tail. He's got his nose high up now—he'll have to bring it down before morning. Often have I watched him go round like the sails of a windmill, when I've kept watch on board the lightship.—Jonas! I think I'm turning about myself, like the Great Bear; but my head is the point on which I revolve. It's a wonderful consideration to me, Jonas, that the Great Bear always knows what to do with his front-paws. They are the pointers. Draw a line through them wherever they may be, and it touches the north star. And when you consider that the Bear is never still, always turning about on the tip of his tail, I say it is marvellous! There is instinct for you. I couldn't do it. My paws are never in place. If I stick them into my pockets, I am wrong. If I put them down straight and stiff, one on either side of me, I'm wrong again. If I plant them on my knees, it is worse than ever. If I draw the back of one of them across my face, it is as bad as murder. Then, Jonas, whatever shall I say about my hind-feet, as Hezekiah Marriage calls them? I can't keep them anywhere where they do not give offence. I've curled them in a sort of knot under my chair where I've been sitting, and I was told I looked absurd—all at ease. I've stretched them out straight before me, and I was informed I was uncouth. I've put one on one side of my chair and the other on the other side, and that was not right neither; and then the boots have been so smeared with rancid tallow, to keep out the water, that they won't do neither. I'm well aware, Jonas, in the sphere to which I'm elevated, that I'm looked on much as a great ungainly Bear; but I wish in that same firmament I knew how to dispose of my extremities. Oh, the agony of mind those extremities of mine have caused me! Why is it, Jonas, that no beast or bird or creeping thing has any thought about or difficulty with its extremities, but only man?—and we're made to believe he is the lord of creation.—I tell you what I think, Jonas—you're not laughing at me. It is in polite society only—we get laughed at and sneered at. It is not my feet, but *her* eyes that are the pointers; they are for ever pointing out my extremities, turn them about and put them where I may. Take her bright brown eyes and draw a line through them'— He checked himself, and said hastily: 'I'm not speaking of my wife; I'm not going to have her alluded to in this company, nor her name named, because your mouths have not been fashioned to pronounce it right, nor can your heads understand her ways of going on, and I won't have any commenting on and criticising of what you do not understand. We'll turn the conversation to the *Bessie*.'

The cold night-air was affecting him. He who was usually so little of a talker, had become loquacious; but then for many days he had been afraid to speak lest he should commit a solecism, and now that the fear was removed, he talked a great deal.

'There is the light out yonder—or two, is it?—where I used to be in the boat. They have put another vessel there now, and another man is in

it. Why! Jonas, I almost wish I were back at the old work, cleaning of the lamp, instead of always being a-snuffing and cleaning and polishing of myself—and never able to get myself right, always smudges somewhere, and rust-marks, and smoke and smut. Out yonder, one day passed much like another, and all peaceable. True enough, we had storms, and I was tossed about; but there never was any storm and tossing about inside of me; and now it is all inward, and none without. I'd rather the billows ran mountains high and the breakers foamed over my head, than have the seas so heavy within.—What creatures we are, Jonas! When I was on the boat, I was always longing to be ashore with my little ones; and when I was ashore—somehow, I wasn't altogether sorry when my time came to return to the ship. So, I guess, when a man's a bachelor, he longs to be married; and when he's married, he looks back on his singleness with great longing. We always wally what we haven't got. Man is a perverse animal, Jonas.'

'Polly was a good wife. You think of her at times still—though she wasn't rich and accomplished.'

'Polly!'—Richard tried to recover himself; he was lurching against his brother-in-law. 'Polly was an excellent wife.—But, Jonas, I will have no comparisons drawn. If you mean to insinuate anything against my present wife, you make me your enemy for life. Polly was everything that was right and good in her way; and I have no doubt that—that *she*—her name is more than we can pronounce right, we uneducated folk—*she*—What was I saying? She also is all that is excellent in her way. We do not compare them; they are different.—Let us turn the conversation. The Great Bear stands in the sky, always a-turning on the end of his tail, which is a moral lesson to us always to keep the conversation a-turning.'

The two had nearly reached the cottage. Richard's talk became more disjointed, his walk less steady. The cold air ensuing on the heated atmosphere of the tavern parlour, exercised its usual effect. He had left the *Anchor* exhilarated; he was now intoxicated.

Was this the same Richard Cable who was wont to return home with raised head and even step, and whistling, to let his little ones know that their father was coming to them to kiss them ere they closed their eyes in sleep? Was this the same Richard Cable now reeling along the road maundering nonsense? What had occasioned this change? Only a drop of poison infused into his blood. The boys in *Æsop's* fable threw stones at the frogs, whereon one of the tribe raised his head out of the water and said: 'What is fun to you is death to us; and so may many a man croak in his pain, when merry creatures pelt him with hard words: 'What is fun to them demoralises me.' Richard was already demoralised. His self-respect had met with a mortal wound. This self-respect was the stay which had held up all his other virtues. Strong in his manly dignity, he had been gentle, patient, self-controlled, modest, and temperate. Josephine had struck at his sense of moral dignity, and when that gave way, every grace that had leaned on it went into the dust at the same time.

A Spanish bull-fight is by no means the even

conflict of equally opposed antagonists that we supposed in childhood. The bulls have no inclination to fight; their disposition is peaceable. It is only after persistent and prolonged efforts, that the matadores can goad them into pugnacity. They endure without resistance the stab of knife and the prod of lance. They turn their heads away, so as not to see the fluttered scarlet cloaks. And we men are much the same—placable, indisposed to gore, ready to rub our noses against the hands of our gaily tricked-out tormentors, against hands wet with our blood. We thrust our stupid heads against their breasts, asking to be patted on our flanks or rubbed between the horns. We do not want to fight, not we! We would not tear away a ribbon or a lace, or trample on a bugle off the frippery that adorns our tormentors. We have been stabbed, but we submit to wounds, and when next goaded, limit our protest to a subdued bellow. Possibly, we shake our heads in threat, but we mean no harm. When at length, with cruel ingenuity, our pretty persecutors drive barbs into the open wounds, and these barbs are armed with crackers and squibs and Catherine-wheels; and when they dribble Greek-fire and flaming sulphur into our sores, then, in our agony, we toss our heads and paw the ground, and strike the barriers of plank with our horns, ripping them like rushes, and we race, bellowing, blinded, mad, round the arena—then woe to those who stand in our way; we are no longer responsible for our actions.

Bessie Cable was sitting in the cottage by the table, in the front kitchen. She had been cutting out a dress for baby, a little pink dress with white sprigs on it, a very small pattern; and Mary sat on a stool beside her, hemming the pieces together. The cut-out scraps lay on the table, some ready for Mrs Cable to sew together. Near her feet was the cradle, in which baby lay asleep.

'O grannie!' said Mary, 'will she not look sweet in this pink dress? And she will have a red sash and red bows on her little shoulders. She will be a sweet little rosebud, will she not?' Then Mary stooped over the sleeping child. 'Do, grannie! look at her,' she said. 'Was there ever such a darling! What a pretty little dimple she has! She is laughing in her sleep. I do believe she is dreaming about her new frock.—Do you think, grandmamma, that babies know what is going to happen? I suppose the angels do, because they are so near God, who knows everything that is to be. I daresay little baby-souls that have just come down from God can see a little way into what is going to happen, and that is why Bessie is laughing now—she sees the pink frock in which she will be so smart on Sunday.'

'I do not suppose babies see into the future, dear Mary, not even little pink frocks with carnation bows. I do not think it would be well for them. They would see many sorrows and pains; and then, instead of smiling in their sleep, their tears would trickle over their cheeks. They are happy because they are blind to what is to be.'

'Grannie,' pursued Mary, 'how do babies' souls come to them? Father took me outside one night and let me see the falling stars, and he said they were baby-souls coming down out of

heaven from the hand of God. Why do the falling stars always go out when they come near the earth?'

'Because, I suppose, they enter into the little bodies.'

'But—grannie,' Mary went on—she was a thoughtful child, and asked more questions than Bessie Cable had the wit to answer—'how is it that there are no rising stars? They are all falling, and none flying up. It ought not to be so. If we see the little bright souls come down when babies are born, then, when good people die, we should see their souls like bright stars mount up to heaven.—Have you seen them do that?'

'No, dear, never.'

'But why not, grannie?'

'Because the souls get so dust-clogged and darkened and stained with their sojourn on earth, that the brightness is dimmed, and God must clean them again before they shine.'

Mary considered a while, and then said: 'I don't think father's soul will need much cleaning, it shines so bright now.'

'Hark!' said Mrs Cable. 'There is his tread.—No; it is not his tread.'

A hand on the door; it was thrown open, and Richard Cable staggered in, without his coat, which he had forgotten, and left on the cupboard in the *Anchor* parlour. His face was red, his hair disordered, his eyes wandering.

Mary looked up, sprang to her feet with a cry of delight, and with open arms prepared to run to him. His mother laid her work on her lap, and looked at him with doubt and alarm. Mary was arrested by something in his appearance so unusual as to frighten her.

'Richard!' said Mrs Cable, 'what has happened?'

'She shall be christened to-morrow,' he replied; 'rechristened to-morrow—and called henceforth the *Bessie*.'

His mother knew what had occurred. The tone of his voice, the drawl in his speech, his position lurching from one foot to the other, declared it.

'Father, dear,' said little Mary, 'how strange you look!'

'Mary,' said Mrs Cable hastily, 'go away. Run up-stairs at once,' rising and catching Mary by the hand. 'Your father is—is unwell. You must go instantly to your room. Say your prayers by yourself, and pray for him.' She hurried the child to the stairs.

Mary went reluctantly; but she was a docile child, and did not venture to disobey. On the stairs she stood and blew a kiss to her father from her little palm. 'Grannie,' she said, 'he is not very unwell, is he? He will be well to-morrow.—Dear father, try to be quite well soon.'

'Halloo!' said Richard, staggering to the table, 'what have we here? A new frock for little Bessie! Ha, ha! Shall we have the yacht new christened to-morrow? No disrespect meant to my wife. No slur cast. But we can't pronounce the name right, so had better not pronounce it at all.' Then he went to the cradle. 'Bessie!' he said, 'come along and crow over giving your name to the yacht. A fine boat that answers her helm, as a racer does a touch on the bridle.'

He stooped, put his hands into the cradle under the child, and raised it out of its crib. 'There's grog in the captain's cabin,' he said, swinging the sleeping child aloft, 'there's water down below.—Halloo! at sea already—life on the ocean wave and on the rolling deep! Up we go! Down we go!' He lurched over.

'For heaven's sake, Richard,' cried his mother from the staircase, where she stood holding Mary's hand—'Richard, let the baby alone! Put her back in the cradle.'

'Don't you fear! The Bessie shall rake the stars with her topmast, and dance in the foam of the ocean. Sha'n't she, my baby! Up she swings with straining timbers, down she goes!' He lost his balance, fell over the cradle; and the child dropped from his hands on the stone floor, before Mrs Cable had time to unlock her hand from Mary's clutch and fly to catch the babe from his uncertain hold. The little creature uttered a cry and was still. But oh!—with a shriek, piercing, tearing through the house, frightening the children in their beds, the father picked himself up on his knees and clasped his hands, one on each side of his head, sobered in one moment of supreme agony and remorse. He knelt as one turned to stone, with his eyes riveted to the white motionless child, lying on the pavement, his face turned to the hue of death. Was the little one killed? Was it severely injured?

'Run, run for the doctor!' ordered Mrs Cable, coming up, yet shrinking from laying her hand under the fallen child, fearful what she might find.

Still, frozen, so immovable that he did not even tremble, Richard knelt, upright, holding his head, with elbows out, and gray lips unclosed, and blank eyes. The child lay on its back, with the little arms apart, motionless, with eyes fixed, and no colour in the face, no movement of the breast, no pulse beating, only a bubble hanging between the lips.

'Run, run for the doctor!' again ordered Mrs Cable.

Then Richard staggered to his feet like one suddenly roused from sleep, and yet under the influence of a dream. Still in his shirt sleeves, and without thought to put on his hat, he went to the door, and ran. He stayed at the doctor's door, but he did not wait for him and return with him to the cottage. He ran on, ran for an hour without stopping in one direction—towards Brentwood Hall.

## BLIND JACK OF KNARESBOROUGH.

THERE is a wonderful law of compensation in nature, if we read her aright; for if she deprives us of one sense, she so quickens the apprehension of the rest that in time we are scarcely conscious of our loss. Blindness has ever been considered the most terrible of such calamities, from the utter helplessness and dependence it is supposed to entail upon its unhappy object. Probably the most extraordinary instance on record of man rendering himself, as it were, wholly independent of eyesight, and actually excelling in such pursuits as depend most upon the visual organs, is that of

John Metcalf, whose life, under the name of 'Blind Jack of Knaresborough,' has been recorded in two curious old tracts. As his sobriquet implies, John Metcalf was born at Knaresborough, in Yorkshire, in the year 1717. His parents were working-people; and when the boy was about six, he was attacked by smallpox, then a scourge as deadly as the plague. He recovered, but with the total loss of sight; but, strange to say, there was nothing in the appearance of the eyes themselves to indicate that they had lost their power; and throughout his life, no one ever suspected, from his look or manner, unless previously informed that such was the case.

By the time he was ten years old, he seems to have experienced little inconvenience from his loss; he could find his way about any part of Knaresborough and join in all the sports and mischief of boys of his own age. Having a taste for music, he was taught the violin. One Squire Woodlands took a great fancy to the poor lad, used to have him up to the Hall, and take him hunting; for, strange as it may sound, there was not a bolder rider in the county of York than blind Jack. No kind of sport came amiss to him. He learned to swim in the Nidd, and soon became so expert that he was employed to dive for the bodies of the drowned. He gained his living principally, however, by playing his violin at weddings and village merry-makings; and in 1732 he received an offer to play at the Harrogate Assembly Rooms. This was some forty years before the immortal Humphry Clinker paid his visit to the northern spa; but the description given by Melford of the public room where the company 'drink tea in the afternoon, and play at cards or dance in the evening,' would equally apply to this period. How primitive the company were may be gauged from the fact that the previous fiddler, the sole musician of the place, was nearly a hundred years old. Jack was highly successful, and soon made himself a favourite with the visitors and the resident gentry, to whom he recommended himself by his love of all kinds of open-air sports, especially those of hunting, cock-fighting, and horse-racing. He was a constant attendant at the York race-meetings, mixed with the Squires as an equal, betted, and was so fortunate, that he was able to buy a racer of his own and run him for small plates. He once rode a match himself for a heavy wager under most difficult conditions. A one-mile circle was marked out by posts, and this was to be ridden thrice round. Large sums were laid that Metcalf would never be able to keep the course; but at each post he stationed a man with a bell, and as this was struck on his approach, he knew exactly when to turn, and so came in the winner, beating his competitor, who had eyesight in his favour.

At bowls, which would seem to depend so much upon accuracy of sight, Metcalf was a great proficient. Yet more marvellous was his skill at card-playing, at which he became such an

adept that few could beat him. He played with cards on which the figures were raised; and his fellow-players named their cards as they laid them down. Boxing is another art that would seem to be unattainable by a blind man, and here again Metcalf upsets all preconceived ideas. There was a gigantic bully at Knaresborough who had constituted himself the terror of the place. One day he insulted a friend of Jack's in a public-house, whereupon the latter challenged him to fight. The fellow eagerly took up the glove, making sure of an easy victory; but in the course of twenty minutes, Metcalf, without receiving any injury himself, had inflicted such a thrashing upon his opponent that he howled for mercy.

Jack was a fine-made man, stood six feet two in his stockings, and was robust in proportion. Although disfigured by the smallpox, he was a great favourite with his companions of the opposite sex; but in consequence of some disagreement on this score, he found it necessary to quit Harrogate for a time, and took the opportunity of paying his first and last visit to London. While in the metropolis, he met several of his Yorkshire patrons; and upon his return to the north, some months afterwards, one of these, Colonel Liddell, who was on the point of starting on the same journey, offered to take him down in his chaise; but Jack gratefully declined his offer, saying he preferred to walk. The two travellers started at the same hour; but at every stage the pedestrian was in advance, and at nightfall put up, by previous arrangement, at the same inn as the colonel. On the Saturday night, the latter expressed his intention of resting through the Sunday; but Jack was determined to push on, and so arrived at his destination a day in advance of the chaise. This would have been a remarkable feat for a man possessed of all his faculties; but for a blind man to outstrip a chaise the whole way in so long a journey was little less than marvellous.

Jack had fixed his affections upon a Miss Benson, the daughter of a Harrogate innkeeper; and upon returning to that town, was greatly concerned to hear that her parents—who looked much higher for their daughter than a blind fiddler—had forced her (during his absence) into an engagement with a young man of property; that the banns had been published, and the wedding-day fixed. On the evening before the bridal morning, Jack received a message from his lady-love asking him to meet her that night in the neighbourhood of the inn; and there he had the delight of hearing that she was still faithful to him and hated his rival. Being a bold fellow, he proposed that they should run away together and get married in a neighbouring town; and the lady, nothing loth, consented. In the meantime, the bridegroom-expectant had made great preparations for celebrating the happy event, ordering a dinner for two hundred persons. But when morning came, the bride was not to be found; nor was anything heard of her until the next day, when the runaway returned as Mrs John Metcalf. It may be added, that she never repented her hasty act; for John made the most devoted of husbands, never forgetting the excellent home from which

he had taken her, and always doing his best to surround her with such comforts as she had been accustomed to enjoy. After his marriage, Metcalf purchased a house in his native town, but still continued, with the help of a boy, to constitute the entire orchestra of the Harrogate Assembly Rooms. He also set up a four-wheeled chaise and a one-horse chair for the accommodation of visitors, these vehicles being the first public carriages ever started there. About the same time, he entered into the fish-trade, making journeys with packhorses to the coast, and thence conveying his goods to Manchester or Leeds; and so indefatigable was he, that he would frequently walk two days and a night with little or no rest.

During the rebellion of 1745, a gentleman of Harrogate named Thornton raised a company at his own expense, to help to repel the invaders, and asked Metcalf to join and assist him in rousing the military ardour of the rustics around. Our blind hero willingly answered to both demands; and being sent out with a recruiting sergeant, worked so zealously, that in two days he had induced one hundred and forty men to join. And when the company started to meet General Wade at Newcastle, Jack, dressed in his blue and buff uniform, with a gold-laced hat upon his head, marched at the head of the company, fiddle in hand, playing *Britons, strike Home*, and other patriotic airs, which he accompanied with his voice.

During his brief military career, Metcalf met with many adventures. Captain Thornton's company was in the surprise at Falkirk, and was dispersed, the leader being taken prisoner, a fate which ultimately befell his faithful henchman, John Metcalf, who was captured by Prince Charlie's men as a spy. His blindness, however, obtained his acquittal, after which, though with much difficulty, he succeeded in rejoining the king's forces in time to be present at several engagements. Jack, from his affliction, was one of the lions of the army, and the Duke of Cumberland was greatly struck by the accuracy with which he kept step and performed all his duties. His musical abilities came in well when the Duke gave a ball at Aberdeen, where for eight hours Jack fiddled away to twenty-eight couples, eliciting frequent cries of 'Bravo!' and 'Well done, Metcalf!' from His Royal Highness, who had taken a great liking to the blind soldier, so much so, indeed, that had Jack chosen to follow him to London, the Duke would have taken him under his patronage. But after the battle of Culloden, our hero went back to his wife and children, to his old post as the Harrogate orchestra, and gave up soldiering for the rest of his life.

Always sharp and shrewd, however, he had picked up some ideas during his campaign which he quickly put in force; and as soon as peace and order were restored between the two countries, he journeyed into Scotland, and bought up certain articles of native manufacture then little known in England, and did a good trade in retailing them on the southern side of the Border. Those being the days of smuggling, he also did a little in the contraband line. Then he started as a horse-dealer, and was considered one of the finest judges of the equine race in Yorkshire; for so marvellously acute was his sense of touch, that he could almost unerringly judge an animal by

simply running his hand over it. Among his other ventures, he started in 1751 the first stage wagon that ran between York and Knaresborough, driving it himself, and performing the journey twice a week in summer and once in winter.

But not even these multifarious callings were sufficient to exhaust his energies. During his leisure hours he studied mensuration in a way peculiar to himself; and given the length and girth of a piece of timber, could with surprising rapidity reduce its contents to feet and inches. These studies suggested to him the idea of road-making. His first essay was a piece of three miles in length between Fearnby and Minship. He was perfectly successful; and hearing that a new bridge was to be constructed at Boroughbridge, he applied for the contract. 'What do you know about bridge-making?' was the half-contemptuous question his application was greeted with. With the most perfect lucidity, and on purely scientific principles, he explained his plans, and obtained the work. There was another piece of road which all the surveyors had pronounced impossible to construct, on account of the underlying bog; but Jack undertook to accomplish the task; and by making a foundation of brush-wood—an idea that at that time it would seem had not occurred to any one—he succeeded in making a perfectly firm and dry causeway. For many years he now solely devoted himself to repairing and making roads and bridges in different parts of Lancashire, Derbyshire, Cheshire, and Yorkshire.

Though arrived at a somewhat advanced age, Metcalf could not even yet conquer his restless disposition. One of his daughters had married a man in the cotton business, and he was at once seized with a desire to embark in cotton speculations; so, in 1781 he bought spinning-jennies and a carding-engine, spun yarn and manufactured calicoes and printed goods, and took them to Knaresborough to sell, sometimes carrying as much as five stoneweight for many miles. He continued to live with this daughter in Cheshire until 1792, when he returned to his native county, and settled, with another married daughter, at Spofforth, near Wetherby. He now employed himself buying hay and timber-trees. He would measure the stacks with his arms, ascertain the height, and then calculate the number of solid feet they contained. He went through a similar process with the timber. In the year 1800, being then eighty-three years old, he determined to pay a visit to York, in which he had not set foot for thirty-two years; yet he found his way about the streets with perfect ease. During his peregrinations, he passed along a certain road which he had not traversed for sixty years, yet such was his marvellous memory, that he discovered a difference in the hanging of the gates leading to a gentleman's mansion he used to visit as a youth. Going among such of his old friends as were yet in the land of the living, he proved to be as cheerful and convivial as ever, playing his fiddle for the young people to dance to, and thoroughly enjoying the sport himself. Still firm on his legs, he trudged all the way from York to Knaresborough, doing his ten miles in three and a half hours. Long ere this, in 1788, he had lost his faithful partner, who preceded him to the grave by twenty-two

years, for it was not until 1810 that this extraordinary man, hale and hearty and in full possession of his faculties almost to the last, passed away.

## CHECKMATED.

### CHAPTER I.

THE position of Mr David Chester—sometimes known as 'old Davy,' and very often as 'old Chester'—at the time our story opens was one which is only too common, is very sad and hard to bear, and which receives less sympathy than should be awarded to it. He was a clerk out of a situation, and not likely soon to obtain one; for he was turned fifty-five years, and with his thin gray hair and spare wrinkled face looked fully his age. Now, too, he had grown shabby, although decently so, and this added in no slight degree to the difficulty, which needed no addition.

Everywhere it was the same story—he was too old. David strove to show that his experience made him valuable, and that he would come cheap; but he knew beforehand, without the bitter experience he soon obtained, that there is not much virtue in arguments addressed, under such circumstances, to possible employers. 'We prefer younger clerks,' was a reply which could not be gainsaid.

So on one particular day—which, however, was not special in its character—he was standing in Cheapside, hesitating which of two visits he should pay first. A friend had told him that a certain firm was taking on clerks for temporary work, and he thought Chester would be just the man for them. So David went to this house first. He was not kept long in suspense. 'All openings filled,' settled the matter; but, in addition, the clerk who spoke to him added cheerfully: 'We have turned away nigh upon a hundred fellows to-day.' Poor Chester having grown used to these rebuffs, the sting was not so keen as it once had been; nevertheless, he was a trifle more depressed in his air as he left the counting-house.

His next visit was to Brisby, Gadham, & Co., merchants and Indian agents in Great St. Amyott's Court. This was a more trying and, he feared, even a more hopeless visit than the other; for David had served the house when old Peter Gadham ruled there—there had been no Brisby for many years—and had sat for fully a quarter of a century in the dull, sky-lighted office; and with no great salary, no great ambition, perhaps with no great abilities, had jogged on contentedly enough. But old Gadham died. His heirs and successors, on coming into the business, saw that the staff were a drony lot, a long way behind the age; and as they wanted a more go-ahead set of people about them, most of the clerks were dismissed.

David Chester would doubtless have received his dismissal in any case. In old Gadham's family there had been jealousies and heartburnings, such as will gather where the wealth of a bad-tempered, tyrannical old man is coveted and hungered for by a circle of relations; and there had been deeper cause even than this for ill-blood. We

need not go very closely into these matters; it will be enough to say that the son of old Gadham, his only son, who naturally expected—or at one time had done so—to inherit his father's wealth and business, was wholly excluded, and another branch of the family succeeded. It need hardly be said that there was a great deal of ill-feeling over such an arrangement; and as David was supposed to be a partisan of young Ernest Gadham, he was a marked man with the new people. Poor David was wrongly suspected, for he really disliked the young man, who, if only half of what was said of him was true, quite deserved the treatment he had received—was, indeed, let off easily. But some circumstances had given David the repute of being Mr Ernest's adherent, and he was accordingly the first to be paid his month's salary in lieu of notice.

The reader can now understand the clerk's reluctance to call on this firm to ask the boon of some employment as messenger, office-keeper, or anything, in their own or some other warehouse. He had called upon them several times, meeting scant encouragement, but had not tried such an appeal as this, the making of which was terribly painful.

He saw the head-clerk, which he deemed fortunate, inasmuch as this gentleman was well disposed to David and sorry for his ill-luck. He listened to the story the clerk had to tell; told with some sorrowful touches which showed the need of the applicant.

'Upon my word, Chester, I hardly know what to say,' began the head-clerk. 'Things are dreadfully flat; yet, if'—He ceased abruptly; and David, looking round, saw that the head of the firm had entered the office.

This was a portly but harsh-looking gentleman, over whose features came a sterner cast as he met the visitor's eyes. 'Chester here again! What does he want now?' This was of course addressed to the head-clerk, who told in very few words the substance of what he had just heard; and David sought to add something about his long service in the firm; but the principal, either not hearing or not heeding him, said: 'I thought you understood, Chester, that there was nothing for you here. You had better understand it now for good and all; and I do not care about finding you hanging round the place.' As he finished, the principal turned and left the office by his private door, as he had entered, without speaking further to the head-clerk, a pretty clear proof that he was out of temper. So the head-clerk looked at David and shook his head ruefully; and the unlucky visitor left the office, mortified and ashamed.

'He always has been a bitter enemy to me,' muttered David, as he plodded on his long, fagging, familiar walk to Kentish Town, where he lived. His worn and wearied look, as he entered his little parlour, told his story plainly enough to Josie, his daughter, the whir of whose sewing-machine, audible enough in the passage, had ceased when he appeared.

'Well, father,' exclaimed the girl, assuming a cheerful smile, 'have you any good news to-day?'—'Never mind,' she continued, as he shook his head dolefully; 'business will be brisker soon, and then you will be all right. I have had some fresh work in to-day, so there is some

good news.—Now, have your tea; it is all ready.'

Whatever other desirable properties might be lacking to David, he usually possessed a good appetite, this, not unfrequently, when it was rather inconvenient; but to-day he could make no way with his little stew, savoury though it was; and his daughter, checking herself in her cheerful gossip, asked him if he were ill, or had over-walked himself, or had had one of those nasty headaches again.

'No, Josie,' returned her father; 'I have suffered from nothing, and nothing has happened that might not have been foreseen. I was foolish enough to try again at Gadham's; and Mr Robinson, the chief bookkeeper, would have listened to me; but Mr Gadham came in.' He then detailed, with perhaps some added colouring, the unpleasant interview with the head of the firm, his daughter making various sympathetic comments as he proceeded. 'It is all through that business of Mr Ernest and his father,' David concluded. 'Because it is known I was the one generally chosen to take messages backwards and forwards, after the quarrel—which I could not help—these people think I was all on Ernest's side, and tried to prejudice the old man against them. I have always said, that while Mr Ernest behaved very wrongly, especially in drawing bills or cheques on his father without permission, yet he did this for no great sum, and, as an only child, he took liberties. But he was punished too severely—too severely for that fault, Josie. Yet he was not a good young man. But there!' he exclaimed, rallying with an effort, 'I need not go over all this again. Let me eat my dinner, and be thankful I have such a nice dinner to eat.'

Josie resumed her sewing-machine; and after finishing his meal, David sat and smoked his pipe by the open window, for it was summer-time; and a belt of garden lying between the house and the pavement of the quiet street, made the lookout quite secluded, if not absolutely country-like.

Josie being busy, and David occupied with his own thoughts, they had not spoken for some time, until the garden gate creaking, the latter looked up, and saw Minnie coming in. 'And some one with her, Josie!' he exclaimed. 'A man. Who could it be?'

A knock following, he rose to open the door; and Josie, pausing to listen, turned scarlet—she was usually pale—which grew deeper in colour as she heard a laugh at the door, with an exclamation of surprise from her father: 'Come in, my boy! Come in, and let us have a good look at you! Who would have dreamed of seeing you so soon!—Why, Josie, it is Geoffrey—Geoffrey Coyne!'

Minnie, a girl of sixteen, but a big and bounding lass, came first, and was followed by a well-built, good-looking young fellow of some three or four and twenty. His bronzed cheeks and a certain roll in his gait bespoke the stranger to be of the 'seafaring persuasion,' as indeed he was, being employed on a large ship as clerk, store-keeper, purser, or whatever the proper nautical description may be.

'Yes, here I am!' he exclaimed.—'And how are you, Mr Chester? I met Minnie at the top

of the street; she could not say anything then, but I know she is glad to see me.' With this he kissed the smiling Minnie; and having previously shaken hands with Chester, there was no reason why he should not kiss Josie as well.

The sewing-machine was at once abandoned, and Geoffrey became the centre of the little group, telling of his adventures, his promotion, his hopes for the future, which latter, from his appealing so often to Josie, who sat by his side, included perhaps more than he brought prominently forward. It appeared that the young fellow's mother had been for many years housekeeper to the chief owner of the 'line' in which Geoffrey was employed, and from this humble but creditable influence, his position was secure, and his advancement had been rapid. Even the ill success of David was brightened with a tinge of the cheerfulness which the newcomer diffused around him.

'We will soon make that all right!' he cried, with a hearty slap on the old fellow's shoulder. 'I will see our owner; and if you would like to have something down at the waterside offices, I have no doubt I could get you an offer. They do not pay high salaries there, but the hours are easy.'

David of course expressed his pleasure at hearing this, and also his readiness to accept any position. Then the young man had to hear, from father and daughter, an account of the injustice and cruelty of Mr Gadham, at which he was sympathetically indignant.

He turned the conversation, however, by suddenly exclaiming: 'I quite forgot! I have two Australian presents for Josie and Minnie.—Minnie's is the prettiest. What do you think it is?'

The pleased and blushing Minnie guessed several of the objects most dear to the girlish mind, but in vain.

'Nothing of the kind,' returned Geoffrey. 'It is a treasure from an Australian chief—his greatest treasure. A necklace, Minnie, beautifully made of the skin of a snake'—here both the girls shuddered—'and fibre from the bark of a tree, ornamented with twelve eye-teeth taken from the heads of his dead enemies—all taken by himself or his tribe.'

The girls, with something like a scream, protested against such a present; while even David gave it as his opinion that 'it would not do.'

'To tell you the truth, I do not think it would,' said Coyne, laughing. 'I could have had it, however, from my friend Jack—Cloudy Range Jack—who insisted upon giving me some little keepsake; so I chose two others, not half so much prized as the necklace had been.—A brooch for you, Minnie, studded with nuggets of gold, just as they came from the mine. The same for Josie, a trifle larger, with a circle of garnets as well.'

The brooches were produced, examined, fastened on, and pronounced 'lovely'; David adding that he thought it very generous of Mr Jack Cloudesley.

'No, no!' interrupted Coyne; 'not Cloudesley, but Cloudy Range Jack. I never knew his other name. There are plenty of men over there who are called after the ranges, or districts, or diggings where they have been working, and it is not

considered strict etiquette to inquire further. Jack had been living at Cloudy Range; so you see how he got his name. It was through a little adventure on his part—and I suppose on mine also—that we became such friends. One night I had been a few miles up the country, and while walking back I saw, by the light of the half-moon, two men standing under the shade of a tree, evidently hiding. I thought they were after no good, so went cautiously and on my guard towards them; but a man, walking in the other direction, came up first, and the thieves sprang upon him. He was knocked down by a blow which laid his head open, and I think they meant killing him; but, luckily, I was armed, and fired a couple of shots from my revolver at the fellows. They were both hit, but were able to make off; and I helped the stranger up. He went back to the city with me. He, as you have guessed, was Cloudy Range Jack, one of the best fellows I ever met; and I believe we shall be friends for life. But I did something after that which Mr Chester may not think very business-like.

'I don't suppose I shall set myself up for a judge of what is business-like or not,' said David, with a smile which was anything but cheerful; 'but let us hear it.'

'Well,' continued Coyne, after a moment's hesitation, 'Jack had heard of a land or mining spec. which he was sure was good, although the owner had grown tired of it; and as he gave me the chance, I joined him. It took my savings and an advance note on our agents; but at the worst, I can sell for what I gave; in fact, I had a slightly better offer before leaving; but Jack, who knows all about the spot, says he would not take ten times the money. This was only just before I sailed for home.'

David said nothing, though in his heart he did not think highly of the speculation—with a man whose name, even, Geoffrey did not know! But the girls were hopeful, as Geoffrey was.

On inquiry, Geoffrey found that his chief—the shipowner—was out of town, but was sure to return before the *Royal Oak* sailed, and the young man felt confident that his application on behalf of his old friend would be successful. So David Chester made up his mind to bear the delay hopefully; but every day made it worse and harder for the little family to struggle on, as Minnie earned but a trifle, while Josie had to toil very hard at the machine to provide even the plain food which satisfied them. The mother had been dead some years.

'Thank heaven!' the clerk was wont to say, 'she was spared this trouble.—I had thought, he would often continue, 'that I never, never could be reconciled to her loss; but now I can say I am thankful she is gone.'

Partly from force of habit, and partly because it was so dull and dreary to sit all day at home, the clerk made his usual visits to the City, and called occasionally at some friendly office, but with the invariable result. Upon a certain day, as Chester was going slowly home, tired as usual, and full of misgivings as to his young friend's influence proving sufficient to serve him, a voice, hearty, or at anyrate loud, exclaimed: 'David Chester!—honest old Davy once again! How are you, my old patriarch?' The person

who spoke was a tall man, well dressed, with a larger beard and moustache than is commonly seen, and he was probably nearer forty than thirty years of age. He smiled as he met the inquiring look of the old clerk, then, clapping him on the shoulder, laughed openly. 'Don't you know me?' he asked.

'Yes, yes; I think I do,' hesitatingly replied Chester; 'but I cannot call to mind where.'

'Ah! ah! you cannot!' laughed the other. 'Well, the middle of Aldersgate Street is not a good place for indulging in sentimental reminiscences. Come in here, and try if a glass or two of wine will not freshen your memory, although, David, I did not think a few years would have made such a difference.' He turned, and Chester followed him; the old fellow was not proof against the temptation of a glass of wine, a luxury unknown to him through all these dreary days of failure. Ensnared in the private bar of a tavern hard by, the stranger ordered the wine, and then faced Chester again.

'Do you mean to say that you cannot—' Ah! I see you do, now,' he cried; 'I see it in your eyes.'

'Yes, I know you,' said Chester; 'you are Mr Ernest Gadham. I knew your voice at first, and there was something in you— But how changed you are! You are stouter; you had no beard or moustache in those days, and your dress'—

'All great improvements, no doubt you mean to say,' interrupted the other. 'Well, never mind those points. Here is your health, my old friend; I know you will pledge mine.'

David readily did so, and his companion proceeded: 'They thought—you know who I mean—that I was dead; they hoped it; and hearing nothing of me, believed it. I suppose you are not with them?'

This was a subject on which Chester required small pressing, and he launched out into a history of the firm of Brisby, Gadham, & Co., with lengthy episodes detailing his own grievances, and the atrocious treatment he had experienced at their hands.

'There has been foul-play among them,' said Ernest, when at last the history was finished. 'My poor old father did not bear such malice against me. You know he made a will in my favour, shortly before his death.'

'Did he indeed?' responded Chester, sympathetic in his turn.

'Did he!' echoed Ernest. 'Why, you know he did; you witnessed it, with Sperbrow—that ill-looking fellow who called himself my father's confidential clerk.'

'Yes, you are right,' assented Chester. 'I witnessed a will with Sperbrow; but I did not know what was in it. Was it in your favour?'

'Of course it was. And where is it now?' exclaimed Ernest. 'Those who benefited by the old will, no doubt could tell. But anyhow, I understand you to say you did witness a will with Sperbrow?'

'O yes; I can swear to that!' answered David. 'Where is Sperbrow now, I wonder?'

'Oh, he is dead long ago. Died in New York, I have heard,' said Ernest. 'If I had heard of his being hanged there, I should not have cared; it would have served him right.—Now, David,

what are your prospects? Perhaps I can help you a little, as I have still a few friends left. You want a situation, I suppose?'

This was another theme on which David's tongue was easily set in motion, and he told his hope of a situation at the docks. 'Oh, nonsense! That will not do for you,' said his listener. 'You would have to move from Kentish Town to the Isle of Dogs, or somewhere near; eighteen shillings a week salary, and be turned off directly business grew dull—not to speak of breaking up your home and losing the little connection your daughter has built up. No; that will never do.'

Had David been in a less excited mood, he might have felt some wonder as to how Mr Ernest should know that his daughter had a dress-making connection, as *he* had certainly not alluded to it; or, for the matter of that, he might have been surprised at Mr Ernest knowing that he had any daughters at all. Just now, however, he was hardly in the condition to analyse closely the utterances of such an unexpected friend, and felt nothing but the deepest gratitude when Ernest said he would call upon him next day, before which time he would consult some of his friends. And so they parted.

The clerk's exhilaration lasted after the effects of the wine had ceased, for now, at last, there was to be a change in his luck, and all the way home he was picturing brilliant visions of the future. Once or twice he found himself speculating as to the part of the conversation in which he had given Mr Ernest his address; he could not clearly make this out, so he dismissed it as of no consequence.

'And was Mr Sperbrow such an ill-looking, bad fellow as Mr Ernest describes, father?' asked Josie, when she had heard his story.

'No; I always thought him a very nice decent sort of party,' returned David. 'Perhaps Mr Ernest knows something more about him; but I never heard a word to his discredit, and I am sorry he is dead.'

Whether David had or had not given his address to Ernest, the latter was true to his word and called upon the clerk the next day. His manner was particularly pleasant when speaking to Josie, openly paying her compliments on her good looks, which, although well deserved, were embarrassing, and then excusing himself by referring to the rough society in which he had lived for a long time, which had rather unfitted him for English circles.

One of his friends, he mentioned in the course of conversation, was a person of much influence in the theatrical world, and so he, the speaker, was enabled to promise Miss Josie admission to some of the best theatres in London. Josie's eyes sparkled at this, and so did David's, for this was a treat rarely falling to their lot, and they were enthusiastic lovers of all dramatic exhibitions, from the circus, which they had seen, to the opera, which they had never seen, but pictured as something almost beyond mortal beauty.

Then as to David's future: one thing was certain, Mr Ernest explained, which was, that the clerk must give up all idea of drudging at the docks. He had already seen a gentleman, who had promised that at the turn of the season—poor David did not know what turn or what season was meant—he would give him a befitting

situation. Meanwhile—this was in a whispered conference apart from the girls—there was a five-pound note for present use; and he, Mr Ernest, would take care that his old friend Chester should not run short, until he was fairly lodged in such a berth as would enable him to manage properly.

The reader, then, may guess the impression left by Ernest Gadham, and the praises which were sounded on his departure, after a tolerably long visit. What made his conduct the more gratifying, as David explained to Geoffrey—who was, unfortunately, too late in his visit to see the gentleman—was, that he had no right to expect such kindness.

He had never been a special favourite with young Mr Gadham; on the contrary, though he did not like to say it, he had somewhat disliked the young man. He preferred to account for this marked kindness by supposing that Mr Ernest had been pained to find how he had been persecuted and punished merely for his devotion to the old firm, and felt that he ought to be compensated.

The praise of Mr Gadham did not diminish when, on the very next morning, tickets arrived—'Dress circle and all, father!' as Josie said, with something approaching to awe in her voice—for a popular play. It was not easy, in the face of Minnie's arguments, to decide who should use these tickets; but it was a great deal less easy to decide what Josie should wear on such a state occasion. A few tears of vexation found their way to the girl's eyes when she reviewed her scanty wardrobe. She was a thoroughly amiable girl, bright and cheerful, but she was mortal, and she was feminine, and it would be asking too much of feminine mortality to expect a girl of nineteen to be superior to such considerations. The tickets, it was decided, should be used by Josie and Geoffrey.

It was in the interval between the second and third acts of the last piece, when Josie was just beginning to regret that all would soon be over, that she gave a little start, and uttered an ejaculation which drew Geoffrey's attention.

In answer to his inquiry, she said: 'I have just seen Mr Gadham; I am sure it was him. Yes, there he is, leaning against the column in the corner. I think he saw me; but do not let us appear to be watching him.'

Geoffrey looked earnestly in the direction intimated, anxious to see their generous patron. He saw him leaning against the pillar as described; but a rush of returning seat-owners took place just then, in anticipation of the rising of the drop scene, and when this had subsided, he had either taken a seat where he was hidden, or he had left the house, for they could see him no longer. But as they were leaving the theatre at the close, they saw Mr Gadham emerge from a lobby at the foot of the stairs. He smiled at them, and waved his hand, then stopped, evidently intending to await them. But as he did so, a man, tall and well dressed like himself, but scowling and ill-favoured—so Josie afterwards described him—came out from another lobby, and recognised Mr Gadham. The exclamation he uttered attracted the latter's attention, who started as he turned round, but shook the other's hand warmly; then both hurried off in the direction of the refreshment bar.

All this could be seen by Josie and her companion, for they were within a dozen steps of Mr Gadham when he disappeared. They were astonished and disappointed, and of course talked it over as they rode home in the omnibus. Geoffrey said it was no business of his, and Mr Gadham must do what he pleased, yet it was plain that for the time, his admiration of that gentleman had somewhat abated. He could not understand his conduct. 'And in fact,' said the young man, 'I do not quite understand what he means by this sudden friendship for your father, for whom he never seems to have cared before. I don't quite understand it—I really do not.'

#### FISH OVA AND FISHERY WASTE.

CONSIDERABLE attention has lately been directed to what is called 'fishery waste,' and by-and-by plans for the utilisation of much valuable material that is now entirely lost, or at least only partly made use of, will no doubt be devised. In the meantime, it may prove somewhat useful to show—even in that rough-and-ready way which can only, for want of definite information, be adopted—the difference between the seed sown, or not sown, and the harvest realised. The prodigious powers of reproduction with which nearly all fishes are endowed have been often noticed in connection with their natural history; nor, extraordinary as they may appear to those not familiar with the subject, has there been much exaggeration in the statements made. Taking the herring as an example, the fact of its fecundity can be easily ascertained and established. Throughout Scotland, it is a condition of 'the cure' that the fish salted must be 'full fish'—in other words, must contain the whole of their spawning substance, in order to entitle them to be branded by the Fishery officers, as a mark of their having been cured in the manner prescribed by the Fishery Board. By means of this rule, we obtain an opportunity of becoming familiar with the reproductive power of the herring. Cured herrings from Loch Fyne and elsewhere in Scotland are on sale in many places, and as most of them contain their roes (and milts), we thus find out that the eggs of the herring are almost incredibly numerous, especially when it is taken into account that the fish is not a big one; as a rule, it requires two and a half, and sometimes three or even more herrings to weigh a pound. To ascertain the number of eggs in the roe of a herring is not a difficult task. The simplest plan is to tie the roe in a bit of muslin cloth and drop it for a couple of minutes into boiling water; then carefully weigh the whole mass of roe; after which, cut the ligatures that bind the eggs together, and fill a thimble with the ova. Count the number of eggs in the measure; finish the process by weighing the lot, that is, the thimbleful; and then you possess the clue to the total figure, which is obtained by dividing the weight of the whole by the

weight of the thimbleful. A herring roe usually weighs about an ounce, less or more; and the number of eggs—taking a reasonable average, formed from the counting of some score of roes—will be thirty-one thousand.

The destruction of fish ova annually is enormous, and is not confined to any one fish, as will be shown when we come to consider the case of the cod and haddock. As regards the waste of herring-roe—in one night's fishing at a well-known herring-fishery where, during the season, from eight hundred to one thousand boats are usually at work, it has been ascertained that many barrels of spawn—literal tons, in fact—are wasted because of the fish of the shoal hit upon being almost in the act of spawning. Instead of being restored to the sea, the ova are usually sold to farmers for manure along with other offal! That the eggs so disposed of are ripe, is proved by their exuding freely from the fish; and as they have had the chance of being well mixed while in the boats with the milt of the male herring, the proportion of the sexes being about equal—a case, as we may say, of accidental pisciculture—they would, in all probability, had they been restored to the water whence the herrings which produced them were taken, have hatched, and thus contributed to the millions of fish destined to compose future shoals. Despite such waste, herrings continue, according to some accounts, to be more abundant than ever. During the fishing season of 1885, it may be considered to be pretty near the truth if we state that about two million barrels of herrings were captured off the Scottish coasts. Of that quantity, 1,572,952 barrels were cured; whilst the remainder were sold directly from the boats as fresh herrings; and as each barrel contains at least seven hundred, we can arrive at an idea of the total number captured in one season, which we place at 1,400,000,000 of individual fish. But man, it has been affirmed, with all his cunning devices of capture makes almost no impression on the herring shoals. It has been computed that cod and other fish will consume every year 29,400,000,000. Another factor in the figures of herring consumption is the number eaten by gannets, which has been estimated at 1,110,000,000 of individual herrings. Dogfish and the numerous other enemies of the *Clupeideæ* may be set down as consuming every year as many herrings as are taken by the fishermen of the United Kingdom, which brings out a total in this range of calculation of say 35,000,000,000 of these fish. What, it has more than once been asked, will be the dimensions of a shoal of herrings? It is not possible to do more, we fear, than guess at the area occupied; but if the spaces taken up by all the public parks of the kingdom were joined together and filled with herrings five deep, the area so obtained would not probably be so large as some of the Scottish shoals. On some places off the Scottish coasts as many, perhaps, as a thousand boats will be fishing on the same evening, each boat carrying a train of nets extending from two to three miles in length; and that extent of netting will enable our readers to judge how numerous the fish must be that require such an engine of capture.

The herring has been designated the 'poor man's fish;' and the salmon may certainly be

called the fish of the rich man ; it has been named the 'venison of the waters.' A sixty-pound salmon is nearly all the year round of more value than a Southdown sheep. These fine fish when brought to market range in weight from about eight to thirty-five pounds ; but occasional big ones are taken which vary from thirty-eight to sixty pounds ; such fish are not, however, very plentiful. Taken all over, salmon average not less than twenty pounds per fish, though a few years ago the average had sunk to eighteen pounds. Grilse, the young or unspawned member of the salmon family, generally run from four to seven pounds ; and the average weight of these fish may be taken at five and a half pounds. A salmon of the weight of about twenty-five pounds will yield twenty thousand eggs. These must be deposited in fresh water—although the fish is also able to live in the sea—and require from one hundred to one hundred and twenty days to hatch, according to temperature. During a very mild winter, the period of hatching is not so prolonged as it is in severe weather. In protected places under cover, salmon ova hatch in from sixty-five to seventy-five days ; but in the old ponds at Stormontfield, on the river Tay, and in the river, the eggs seldom yielded their young under a period of four months. Although the salmon, as compared with the herring, may be said to deposit its eggs in a protected place—in the tributary waters, that is to say, of some great salmon stream—a vast number of them are wasted. Spawning takes place in the running water, so that many of the eggs exuded are rapidly borne along by the rushing stream, and are lost so far as the future salmon supply is concerned. Under such circumstances, thousands of the eggs escape the fertilising power of the milt of the male fish, while further thousands are devoured by numerous enemies, which hover around to prey upon them, many kinds of birds being among the number, while the trout inhabiting the same stream of water gorge themselves with the dainty morsels.

In offering any remarks on the stock and marketable fish of a salmon-river, it must be borne in mind that a given expanse of water will only breed and feed a given number of fish. It is not a little remarkable that while it is somewhat of a merit to capture herrings while full of their spawning matter, salmon when filled with milt and roe are protected by statute ; for such fish there is a close-time, and during its observance it is a crime to capture them. It ought to be known that during their spawning seasons fish, as a rule, are unfit for food, their flesh being poor, watery, and probably unwholesome, in consequence of their fat-forming materials being diverted to the formation of their reproductive substances.

The sea-fish which are endowed with the power of reproducing their kind in millions are the conger eel, the turbot, the cod-fish, and two or three of its congeners. Examples of the conger containing from six to fifteen million ova have not been unfrequent, and yet this fish is very rarely seen in our fish-markets or fishmongers' shops : there seems to be a prejudice against it. Congers are frequently sold in foreign fish-markets. Abroad, that member of the eel family seems to be appreciated. Its flesh is excel-

lent, and highly susceptible to the art of the cook.

The classic turbot yields its eggs in millions ; one of these fish, weighing twenty-three pounds, being found to contain a mass of roe that, when manipulated, was resolved into fourteen million eggs. The turbot, although not what may be termed a scarce fish, is not so plentiful as it apparently ought to be, judging from its reproductive power. Taking it all the year round, the turbot is a costly fish, and much dearer usually in London and other large cities and towns than even the salmon. Forty years ago, a turbot could be purchased at many places on the Scottish seaboard for twenty pence, that could not now be bought for the same number of shillings. A considerable number of the turbot which are sold in Billingsgate are brought from Holland by Dutch fishermen. It is to be regretted that large numbers of very young turbot are frequently caught in the trawl-nets, in which they are suffocated by the weight of other fish. These are lost to the table.

As has been indicated, the cod-fish and two or three of the other members of the *Gadidae* family yield their eggs in millions ; the roe of a large cod-fish will weigh seven or eight pounds, and will contain from five to eight million ova. Actual counting is the best guide to the number of eggs which any single fish contains. In America, the number of eggs in various individual fish have been ascertained by actual counting. In each of two cod, which weighed seventy pounds, the number of ova exceeded nine million, the net weight of the mass of eggs being in each case eight pounds two ounces. In other examples, the eggs ranged from about nine million in a fifty-one-pound cod-fish, to nearly three million in one which weighed twenty-one pounds.

The herring, taking its size into account, is as prolific as the cod. Estimating the common run of these *Clupeidæ* at three and a half fish to the pound, it would take about seventy herrings to equal the weight of a twenty-one-pound cod-fish, and such a number of herrings would yield, in all probability, considerably more than three million ova. The cod-fish is wonderfully abundant within the range of its habitat. The officers of the Scottish Fishery Board, in accordance with instructions, keep a note of the quantity cured under their superintendence. From a special Report, we learn that, in the course of one year, three and a half million of cod, ling, and hake were caught to be cured in Scotland, whilst a large number was also taken to be sold *fresh*. But the take of cod in Scottish waters is small when compared with the total number of these fish which are caught all over the world. We have it on pretty good authority that in a recent year seventy-five million of cod-fish were taken from European waters, and seventy-nine million and a half from American waters ; while half that number, it is thought, will be wasted in the prosecution of the fishery. As for the numbers of these animals that never arrive at maturity, it would be vain to make an attempt at computation. With regard to the eggs which float on the water till the infant fish is able to burst from its fragile prison, millions upon millions fall a prey to the numerous animals which seem created to devour them.

In addition to what may be termed the accidental losses occurring from causes over which man has no control, there is carried on, chiefly from Norway, a trade in cod-roe, which is always in demand by the French fishermen for use as a ground-bait. Seventy thousand barrels filled with the roes of the cod were exported from Norway in the year 1880; and as each barrel on the average will contain three hundred roe-bags, we have thus a total of twenty-one million cod-roes put to a non-productive purpose.

The roes, as we may say, are an accident of the cod-fishery. Cod-fish are not caught purposely in order to obtain their eggs; but fish with spawn being taken, that substance is at once utilised by being salted down for export to France. When the trawl-net is hauled on board, it contains a vast percentage of immature fish, which are usually rejected, and thrown into the water; but as many of them are dead, they are lost to the future. In line-fishing, the capture of the animal living is what is always aimed at, as one living cod-fish is worth three or four dead ones. A cargo of live cod is valuable, as the fish can be housed in perforated boxes, and be killed for market as the demand arises. Fish so caught, if about to spawn, ought to be restored to the water.

Another member of the cod-fish family which is also wonderfully abundant is known as the haddock, and is really an excellent and much appreciated table-fish, either served fresh, or smoked as a 'Finnan haddie.' Nearly two million eggs have been found in one of these fish, the weight of which was nine and a half pounds. There is almost no other fish which is brought to market in such quantities in an immature state. This can be seen by any person who will take the trouble, during the earlier months of the year, to glance at the displays of haddock in our fishmongers' shops, where hundreds of these small fish may be seen that have never had the chance of spawning, and most of which are not more than three or four ounces in weight—'fine frying fish, five to the pound.'

Those fish which seem to have been from the beginning destined to the frying-pan, the toothsome flounder and others of the flat-fish family, are also wonderfully fecund, and yield very large numbers of eggs. Selecting the sole as an example. It is one of our most popular fishes. It is certain that during the last twenty years we have been eating more soles than the stock can fairly yield; in other words, the sole is being 'overfished.' One would suppose that a fish which yields its eggs in hundreds of thousands would always be plentiful; but in the case of the sole we have evidence to the contrary. It has been fished for as if the stock would never go done, and thousands of soles are sold which are a long way from maturity. 'Slips' these little fish are called, and they are not bigger than a dainty lady's hand, say a hand for which 'number sixes' would be almost too large. No soles ought to be brought to market which are below the size of a big man's foot. Evidence has been offered of the destruction of immature soles which is constantly taking place. Hundreds of thousands are annually captured which those who capture them are afraid to bring on shore, they are so small.

As regards the common flounder, the fact has been placed on record that on one occasion two and a half million of these fish were taken. The plaice is a plentiful fish—over thirty-three million of it have reached Billingsgate and been disposed of in the course of a year. In one particular season, the consignments to that piscatorial bourse of the smaller flat-fishes became so great, the fish being so plentiful, that on some especial days they were given away in any quantity to all who came for them. The largest of all the flat-fishes is the halibut, examples of which have been taken weighing from twenty-five to eighty pounds. That fish is also a prolific breeder.

From the figures already given, and others which might be adduced, if further proof were necessary, the difference between the seed sown and the harvest gathered is not a little startling. The seed is sown in millions, but it is only in thousands the harvest is gathered. A time is coming, however, when such waste as is really preventable will be prevented. As has been hinted in the course of the preceding remarks, fishermen have but little chance of selection, and can only capture such fish as enter their nets; hence the vast numbers of small and immature haddocks and soles which are offered for sale in our fishmongers' shops. Hence also it is that about Easter the roes of our chief round-fish are always to be seen on sale. These can be so cooked as to form appetising *plats*, and having been obtained, it is proper they should be utilised; but, nevertheless, the fact of tons of this spawn being on sale shows us in some degree the fishery waste that is always going forward. The philosophy of a close-time is that fish may have leave to spawn unmolested by man; but so long as it is a condition of the herring-fishery that only 'full herrings' can receive the highest brand, there can never be any rest for that popular and abundant fish; indeed, it seems to be a condition of nature that these animals of the great deep are most accessible to man at that season of their lives only when they stand most in need of his protection.

## SHADOWS OF THE PAST.

I sit alone. The night-wind sighs about my humble bidden. The streets are quiet, for the old clock 'ben the hoose' has just struck twelve, and my thoughts, as they are wont, wander listlessly about the room. The flickering fire reflects its fitful light about me, and casts weird shadows along the floor, for my lamp has burned low. From picture on to picture my eyes wander; but the uncertain light will not stay with them. The oaken sideboard, which has been an heirloom in the family now for generations, stands dull and dead beside me. The otherwise meagre furnishings of my lonely room offer little food for meditation, and I gaze upon the dying embers before me until the glowing tiny casements fall one by one in total wreck and ruin, and their place is marked by blackened ashes.

Upon the mantel-shelf are ranged, with studious care, the little trinkets of a happier time. Here, my mother's tiny oaken workbox, beneath the

unlocked lid of which are placed her silver thimble, that she loved so well; her needles, now besmeared with rust, from lack of use; and her little odds and ends, so needful once, and once so much respected. And there is father's silver snuff-box, with initialed lid and well-carved top; and when I take it from its place, the happier past reveals itself to me. I see his comely face reflected on the lid; I hear his kindly voice speak words of homely comfort and correction, as I have often heard in days gone by. I look, and as I look, the face is gone, and the merry chat of old familiar friends, friends of my father's, strikes upon my ear. The merry song, the merrier laugh, the joyful click of glasses when the toasts are pledged—these bring me back to past festivities, rare, though always happy. The sounds and faces vanish. I open wide the lid, and in the corners of the box there still are seen small particles of my father's favourite snuff. Even now, it has not lost its flavour; and as its minute atoms seek my brain, I think I sit once more with him in the 'auld kirk at hame.' I hear us chant in dragging measures the solemn psalm, and favourite of my father's, 'Old Hundred.' I hear the earnest pastor pray, and the lesson read; and when the sermon is begun, I see the 'snuff-mull' passed from hand to hand; and involuntarily, I stretch it out at arm's-length, even now. Old faces, familiar with their friendliness, appear before me one by one; and forms that I used to know stand betwixt me and the fire. I shut the snuff-box lid, and faces and forms sink away from me. But what is this that lies beside the box? A silver watch with dimpled case. Ah! that, too, tells its tale! Full many a time I have seen that old watch wound and carried forth in hands that used to hold me as a child, and clasp in firm grip with mine in meetings and partings of the later years. I have seen it in its brighter days, when its works were active, and not dead, as they have been for so long! Its owner too! Ah me! how short and yet how long it seems since he took me on his knee and told the story of that very watch.

'The dimple on the case?' he'd say, in answer to my childish query. 'Why, my lad, I've told you that a thousand times, I'm sure.' And now, I hear the story told again. I see the opposing forces stand at Waterloo; I hear the heavy guns burst in upon my ear, the yells of pain and shouts of exhortation; and among the British ranks stands one I know to be my father. The bullets, bringing death, whiz past in fast succession. I watch my father with his brave companions fighting in the thickest of the fray. I fear his death, and pray for his deliverance. A bullet strikes his breast. 'O God,' I cry, 'he's gone!' I look again; but still he fights right manfully. How is this? That silver watch guarded the spot which the bullet struck. My father's life was saved! I hear a cheer that shakes the earth on which I stand; I see the stubborn foe disperse

like chaff; and now I know that Waterloo is won. The scene of carnage melts away. I put the watch back to its sacred place, just as the dying notes of victory touch my ear.

Beside the watch there lies a time-stained case. I open it, and find therein my father's and my mother's spectacles. As I draw them from their place, I am once more a reckless lad at home. I sit before the glowing fire, upon the favourite footstool at my mother's knee. She wears her spectacles; and as she strokes my head with her soft hand, I hear my father's voice. Before him lies the 'big ha' Bible,' and from its well-thumbed page he reads the 'old, old story.' Worship done, I feel the gentle pressure of my mother's lips as I say 'Good-night' to her. Again I look at them, and other scenes break in upon my view. My father sits in his armchair and reads; while mother plies her stocking-wires, that always went so fast, and all to keep her 'dear boy' and his father comfortable.

Again I am a schoolboy, and once more I see my father 'put his glasses on,' and with the handle of his snuff-spoon, point the lines as I decipher them.

I close the case, and as I try to think, the solemn strains of music strike upon my ear. It is the deep notes of a funeral service. My father's chair is empty, and my mother weeps. A sad and slow procession wends its way along the country road; and now I stand within an old churchyard, close beside an open grave. I see the coffin lowered, and something tells me that it is my father's. I hear the sullen thud of the dank mould upon the coffin lid. I feel my senses reel—and then there is a blank which I can never fill.

I put the ancient case away, and as I do so, a curious tremor seizes hold on me. I stand beside a bed, and on it lies my mother. I watch her as her fitful breath tells that the flickering flame of life is all but gone. I feel her press my hand, and hear her tell me, in a faltering whisper, not to grieve, but to put my faith in Christ, and we should meet again, though not on earth. Again I stand beside an open grave and sob, as her 'narrow bed' is hidden from my sight; and then the melancholy scene falls back and disappears.

Once more I scan the mantel-shelf, and there, half hidden in a crevice of the wall, I see a tiny paper parcel. I open it, and find within a lock of yellow hair. Ah me! that golden ringlet opens out a volume of the past. I feel that I am young again and full of hope. The moon shines down upon the glassy lake, and I stroll listlessly with a fair companion along the woodland path, and speak of love and future happiness. I feel the gentle pressure of my loved one's hand, and hear her tell me that she'll aye be mine! But darker days come on. I watch the progress of that dry, harsh cough; I see the face grow wan and pinched, the eyes grow dull, the shoulders stoop, the hands grow thinner by degrees. She tells me she is dying; and I know she speaks the awful truth. My hopes and aspirations fall, for they were all built up in that sweet form! I watch her while

she dies—by day and night I watch, till the change comes, and I am left alone! But on the evening that her spirit fled, she gave me that yellow curl from off her head, and there and then I vowed to keep it sacred.

I hear the old clock chime the hour of two; I look around me, and the room is dark. My fire is out; my oil-lamp burns low; and I have been amidst the Shadows of the Past.

## OCCASIONAL NOTES.

### MEMORIAL TO MOZART.

AFTER much discussion, it has at length been decided that Mozart is to have a statue erected to his memory in front of the Opera House at Vienna, which is said to be one of the finest and most appropriate sites that could have been selected throughout the city. The design for the statue it is understood will be thrown open to competition. Public and private subscriptions have at present brought in upwards of five thousand two hundred pounds, so that it is to be hoped that the memorial will be one worthy of him who was not only one of the most accomplished musicians of his day, but the most graceful and melodious of writers, and who raised the tone of opera in Germany to the high position it subsequently obtained and retained. The music of Mozart, whether sacred or secular, will surely live in the hearts and minds of all true lovers of the 'divine art,' and of all who can appreciate the polished melodies of genius wedded to the learned harmonies of science, so long as music itself exists. But, by a strange irony of fate, Mozart, the amiable and gifted composer, popular everywhere, admired by all, died a very poor man; and his son was allowed to eke out a precarious existence by teaching music in the capital where upwards of five thousand pounds has been readily subscribed for the erection of a statue to the father, who was in his own day left almost to the tender mercies of poverty!

### THE EXTINCT AUSTRALIAN LION.

It has long been a disputed point, and indeed a vexed question, as to whether the so-called great Australian lion ever existed. Some interesting discoveries, however, have been recently made in the Wellington Caves, New South Wales, of undoubted remains of this animal. The bones are at present deposited in the Mines Department Museum, Sydney, and consist of several very complete jawbones, containing the teeth in an excellent state of preservation. Prior to being publicly exhibited, they were submitted to the inspection of Professor Sir Richard Owen, of the British Museum; and his opinion is, that the animal was a marsupial or pouch-bearing lion, fully equal in size to the existing African species. Discoveries of leonine remains have at various times been made in New South Wales, and also in Victoria, and the specimens in question are well preserved. They have been excavated from post-pleiocene deposits; and in connection with them were the remains of what are known as the Tasmanian Tiger and the Tasmanian Devil. An equally interesting fact is that Professor Owen, when referring, many years ago, to the herbivorous characteristics of the 'Australian Diprotodon,'

expressed his conviction that some large carnivorous animal must have been co-existent with him, to keep the race in check, and that probably lions then inhabited Australia, an hypothesis which has been fully verified. These facts are interesting, as helping to establish the fact of the existence in former ages of the lion in Australia.

## FRIENDSHIP'S MESSAGE.

### I.

FRIEND ever faithful, as I sit alone,  
Sad as the gloaming that infolds me round,  
Dead embers dropping on the white hearthstone,  
Fall on mine ear with melancholy sound,  
And the low winds are sighing with regret,  
Though dying day is faintly smiling yet.

### II.

The moon has risen o'er the silent street  
Like the pure soul of the departed day,  
Shedding from heaven a benediction sweet,  
The while her silvery beams like spirits stray,  
With noiseless footsteps through my open door,  
And gently wander o'er the cottage floor.

### III.

Dreams of delightful moments passed with thee  
Come to me, dearest, with this pensive hour;  
Through shadowy trees thy lilac robe I see  
Sweeping so lightly o'er each slumberous flower;  
I see the dewdrops twinkling here and there,  
'Mid the dark tresses of thy clustering hair.

### IV.

As with the tinkling brook our voices blend,  
I mark the flush upon thy dimpling cheek,  
And whisper softly in thine ear: 'Sweet friend,  
They know thee not who say the world is bleak;  
To me at least 'tis neither bleak nor drear,  
So long as thy warm heart is throbbing near.'

### V.

And as I speak, my hand steals into thine,  
Like a tired bird that seeks some resting-place;  
I know, I feel, thy precious love is mine,  
By thy fond eyes and sympathetic face.  
My voice is trembling, as I tell thee how  
Life would be dark without thy friendship now.

### VI.

Let it be changeless, dear, through good and ill.  
When friends less loved shall coldly pass me by,  
I will not mourn, if thou art faithful still.  
How could I miss them, sweet, when thou art nigh?  
Ah, I could even smile, and let them go,  
Content with thee, because I love thee so.

### VII.

When sorrow's tears have dimmed thy gentle eyes,  
Thy sacred grief shall chain me to thy side:  
He will not shrink from cold December skies,  
Who won thy friendship in the summer's pride:  
Then in our hearts shall summer roses blow,  
For love alone can thaw the wintry snow.

## THE LAND OF SALMON.

Nor Scotland, reader, nor the north of Ireland, nor even the wonderful land in the Far West, where fish by the thousand become the property of the enterprising 'canners'—no; but away to the East, at the *Ultima Thule* of Asia, which drops like a pendule from the continental bulk into the waters of the North Pacific. In other words—Kamschatka, the little-known peninsula to the west of the strange seal-world of which we have lately seen something in these pages (see No. 152). Kamschatka still belongs, as the Seal Islands used to do, to Russia; and it has been very much of a 'sealed book' to Europeans generally, however much it may be known to the officials of the great White Czar.

The history of Kamschatka may be said to date from 1690, for in that year it is supposed to have been discovered by Morosco or Moroskoi, a Cossack chief. Seven years later, Russia took formal possession, without knowing much about the new land; and only in 1728 was it demonstrated by Behring to be a peninsula. Captain Clerke, the successor of Captain Cook, voyaged up to its shores, but died as soon as he sighted them in 1779, and was buried at Petropaulovski. This place, which may be called the capital of Kamschatka, was practically founded by Behring, who wintered there in 1740, and established a little settlement, which he called after his two vessels, the *St Peter* and the *St Paul*. It was from this place that, in the following year, Behring started on his last eventful and disastrous voyage to the north. As he sailed he would doubtless see, one hundred and forty-six years ago, what a traveller of our own country saw in 1882, and has thus described: 'Rarely have I seen a wilder-looking coast than that of South-eastern Kamschatka. The brilliant sunshine which poured upon rock and headland (it was the month of August) redeemed it from gloom, but the wildness and desolation of the scene were indescribable. Precipitous cliffs, at the foot of which none but a bird could land; deep valleys, running down to the sea, at whose mouths

still lay the accumulated masses of last winter's snow; pinnacle rocks, like rows of iron teeth, shown to warn off any one rash enough to contemplate a landing—this was what met our gaze, as we anxiously scanned the coast with our glasses. Beyond, the land rose in abrupt humps and irregular masses, and appeared to be clothed with a uniform growth of low but dense under-wood, above which the distant cones of snow stood out clear and hard against the sky. It was an impracticable-looking country enough; but we had visited it with the firm intention of going through it; and experience in other lands having taught us how often difficulties disappear upon a closer acquaintance, we did not allow ourselves to feel discouraged. An hour or two later, we arrived at the narrow entrance of Avatcha Bay, and shaped our course over a smooth sea for the little harbour of Petropaulovski.'

Thus wrote Dr F. H. H. Guillemard, who, in the yacht *Marchesa*,\* visited many lands, but none more remarkable than this of which we are now writing. Avatcha Bay is stated to be one of the finest harbours in the world, outrivalling even the bays of Rio and of Sydney, which are usually accorded the first place. It is a nearly circular basin of about nine miles in diameter, with a narrow entrance to the south-south-east, with a depth of ten to twelve fathoms, no dangers, and surrounded by superb scenery. To the south of Avatcha Bay is the volcanic mountain Vilitchinska, rising in a cone to seven thousand feet, now quiescent, and with a flat-topped neighbour, rising to eight thousand feet. To the north there is a trio of volcanoes 'such as one rarely sees'—towering masses of glittering snow, around whose summits light vaporose streamers float out.

Petropaulovski (or Petropaulsk, as the people call it 'for short') is a mere hamlet, with more houses than inhabitants. It is no longer a military post and arsenal, and the entire authority is

\* See *The Cruise of the Marchesa* (John Murray, London, 1886). We here acknowledge our indebtedness to this work for much of the information we now present.

vested in the Russian representative or *Ispravnik*. There are some ten European residents, six gentlemen and four ladies, the former employed in superintending the operations of the Alaska Commercial Company and other fur-traders. There is also a doctor, Dybowski, whose district extends over *one hundred thousand square miles*! This Dr Dybowski is a great naturalist and geologist—a Pole, exiled to Siberia, then pardoned, and made government doctor in Kamschatka. He occupies himself with science in the summer, and visits his patients during the winter, when travelling is easier by means of sledges.

Salmon is the great wealth of Kamschatka. At one haul of the seine in the bay, a boat's crew landed three hundred. The Avatcha River is teeming with the fish; and at one little village of ten huts, twenty thousand fish is said to be no uncommon single day's take! This is where they are permitted to stake the river; but everywhere the harvest is more than abundant. During the season the people work day and night, in order to lay up a store for the winter; for they both live among and live upon salmon. The air is laden with the odour of the fish, and the people are permanently saturated with it.

The way they dry the salmon is this: They have in each village a set of open sheds, in which they hang up the fish across sticks, after splitting them down to the tails, removing the heads, and cleaning and washing the insides. The sticks are placed a few inches apart, with the ends resting on poles which run from end to end of the sheds, so that they are exposed to the air, but protected from the sun. They are also hung so as to be out of reach of the numberless dogs which the natives always have about them. And there they hang until they are swarming with maggots; then they are buried in pits for three or four months; and if so much decomposed as to have to be laded instead of lifted out, so much the better for their tastes!

A Russian traveller, Krasheninnikov, one hundred years ago, wrote that 'the fish come from the sea in such numbers that they stop the course of the rivers, and cause them to overflow the banks; and when the waters fall, there remains a surprising quantity of dead fish upon the shore, which produces an intolerable stench; and at this time the bears and dogs catch more fish with their paws than people do at other places with their nets.' The fish begin to ascend the Kamschatkan rivers from the sea in May, and continue to arrive up to about the middle of August. They go up to spawn; but few ever come down again; in fact, in the case of some of the species, every fish appears to perish in the rivers—by overcrowding, and at the hands of man and other natural enemies; for all the birds and beasts of this strange land seem to live on salmon.

Dr Guillemard, who is not prone to exaggeration, says that he never realised how vast are the numbers of salmon until he saw the rivers. Their back fins would be in sight as far as the eye could follow the stream; hundreds would be aground and gasping in the shallows; hundreds more dead or dying on the banks; while those in the waters were absolutely touching each other; and in ford-

ing, the horses could hardly avoid stepping on them. In such circumstances, fishing is useless; you simply walk into the water; select your salmon as you would at the fishmonger's, and spear him at your leisure—that is, if you are more epicurean than the natives, who eat them all, fresh or foul, dried or rotten. And yet the millions which are caught and eaten annually are as nothing to the millions which perish naturally, and line the banks of the streams with their rotting carcases.

One cannot help thinking what a vast waste of natural wealth there is in this curious land, and how, if commercial enterprise would engage in utilising it, even the 'canneries' of the Pacific States and Labrador might be reduced to insignificance in comparison. But distance from markets, and climate, are important factors; and besides, imported skilled labour would be needed for the 'canning' process. It is not so easy to see, however, why Kamschatka should not export large quantities of dried, salted, smoked, and kippered salmon—work quite within the capacity of the native labour.

Besides being the home of the salmon, Kamschatka is also the home of a much more valuable animal, commercially speaking—the sable. The fur of this animal is the most valuable export of the country, and a large proportion of the inhabitants are solely engaged for the greater portion of the year in sable-hunting. The export trade seems to be practically 'controlled'—as the Americans say—by a Russo-American Jew, who is familiarly known as the 'king of Kamschatka,' and who is said by Dr Guillemard not to be at all a favourite, either of the Russian government or of the hunters and inhabitants generally. He takes all their skins off their hands—usually at a 'slump' price per head, good and bad together—and he pays them pretty much on the truck system, having a general 'store' at Petropaulovski, to which they must all resort for their needful supplies. We learn that 'in St Petersburg the price of a single sable skin ranges from two to twenty-five pounds. In Kamschatka, the wretched peasant, living upon half-rotten fish, and exposed to the rigours of a climate which in its severity surpasses that of almost every inhabited region of the world, receives nominally an average of sixteen roubles\* per skin. In reality, he has to take out this value in goods. He is wise if he does so, and can keep clear of the brandy, which, in spite of the law which forbids its sale anywhere but in Petropaulovski, has proved the ruin of so many of his countrymen.'

The fur of the sable is in best condition in winter, and it is trapped then; for in the spring, even if the winter coat remains, the hair drops out after the skin has been prepared. The hunters usually start for their winter's expedition about the end of September, and they have trained dogs with them, a good sable-dog being one of the most valuable possessions of a Kamschatkan hunter. Twenty sables in a season are considered a good catch; but a party of four will sometimes bring in one hundred and twenty or so for their winter's work. There is no official record of the

\* The Russian paper rouble is worth nearly half-a-crown; the silver rouble, about three shillings and sixpence.

number annually exported; but the most of them go through Petropavlovski; and it is known that in 1882, the individual called 'the king' shipped from that place over two thousand. Another portion, however, does not come south, but finds its nearest market at a settlement called Tigil, in the northern part of the peninsula. Perhaps we might place the total export at somewhere about three thousand skins.

The following notes on the animal and the method of hunting, &c., are by Dr Guillemard: 'The sable is always skinned from the tail—bag-shaped; and while performing this operation in the approved fashion of the country, we listened to a sermon on sables and sable-hunting from Afanasi (a native). They are, he told us, for the most part of nocturnal habits, and though they occasionally feed by day, generally spend that period of the twenty-four hours in holes at the roots or in the trunks of trees. They dislike the presence of man, and are rarely to be found in the neighbourhood of the villages, their favourite resort being the depths of the forests least frequented by the natives. It is considered that the most inaccessible and least known parts of the country are the best hunting-grounds. They live on hares, birds of all kinds, and in short, almost any living thing they can kill; but they are also said to eat berries, and even fish. There are, indeed, but few animals apparently which do not live on salmon in Kamschatka. Sables have only one litter during the year, generally in the month of April, and bring forth four or five young at a birth in a nest in the holes of trees. When the hunter is bitten for the first time by one of these animals, the bite is almost invariably followed by severe illness; but on subsequent occasions no ill effects are produced, with the exception, possibly, of slight inflammation of the wound. There are various methods employed in catching sables; but there are fewer of them trapped now than used to be the case. Dogs are almost invariably employed to run them down in the deep snow, or to "tree" them; and they are also smelt out by these trained animals in their holes at the roots of trees. The great object is to tree the sable, if possible. The hunter then surrounds the base of the tree with nets, and either shakes down his quarry or knocks it off the boughs with sticks. If it does not fall into the net, it is run down by the dogs, or compelled again to take refuge in a tree. Should the tree be too high for this method to be successful, it is cut down, or the sable is shot; but the hunters generally avoid the use of the gun if possible, as it is apt to spoil the skin.'

One sable shot by the Doctor's party measured twenty-seven inches in extreme length, and the tail, which in winter is furnished with a thick brush, which disappears in summer, was seven inches long.

Bears are very numerous and of great size. They are hunted in July, August, and September. A single hamlet will sometimes shoot and trap as many as ninety in a season; and there are hunters who boast of having killed more than four hundred bears in their lifetime. Foxes also abound, and a great variety of winged game.

One of the most remarkable animals of Kamschatka is the Bighorn, or wild sheep, which for the most part frequents the precipitous slopes of the sea-cliffs, but is also sometimes met with

in the interior. This interesting animal is thus described: 'The general colour of the Kamschatkan wild sheep (*Ovis nivicola*, Eschscholtz) is a brownish gray, and the hair is very long and thick. The head and neck are more distinctly gray than the rest of the body; the forehead is marked with an ill-defined dark patch; and the lips are nearly white. On the anterior aspect, the legs are of a dark glossy brown; but posteriorly, a narrow white line runs down the entire length of the limb. The tail is short, and dark brown; the rump and the centre of the belly pure white. The ears are remarkably short.'

The measurement of an adult male Bighorn was found to be sixty-seven inches extreme length, fifty-five inches greatest girth, and thirty-nine inches height at the shoulder. The length of the horns round the curves was thirty-five inches, and the breadth from tip to tip about twenty-five inches. Bighorn keep usually in small herds of from three to nine individuals, the males apart from the females and young. The flesh is said to be delicious, superior in flavour to that of the finest domestic sheep.

In winter, the people are clothed in garments of dressed reindeer skin. The *kulankas* is a loose sacque, composed of pieces of the skin sewn together with the sinews of the animal, and provided with a bearskin hood, to draw over the head. Below is worn a pair of breeches of similar character, and then boots, made of soft leather throughout, sole included. Leprosy is very common in Kamschatka, although less prevalent in the interior, and is supposed to be due to the fish diet.

The aboriginals of Kamschatka are Kamschatdales and Koriaks; but little is known of their origin, and both have decreased in numbers since the Russian occupation. The country is now chiefly peopled by Siberian-Russians, and by a race the product of intermarriage between them and the aboriginal Kamschatdales. This new race it is usual to distinguish as Kamschatkans; and a greedy, disagreeable kind of people they seem to be. They are of a low order, and live in summer either in wretched huts by the river-banks, or in lofts above the sheds in which they hang their fish. In winter, they have semi-subterranean dwellings. Their habits and diet are alike filthy; and their notions of honesty meagre. The pure Kamschatdales, on the other hand, appear to be a kindly and a hospitable people. The houses of the better class of natives of Russian blood are usually log-built, unpainted, containing usually two, and sometimes, but rarely, four rooms, in which will be found a few chairs, a rough deal table, a tawdry gilt *ikon* of the Russian Church, and any number of cockroaches and unmentionable insects. The houses are in many places raised above the ground, either upon stones, like haystacks, or upon low wooden pillars. The floors are boarded, and the house is warmed by means of a huge brick stove built in between the rooms, which develops immense heat. The diet of these 'upper classes' is—besides fish—milk, sour cream, ryebread, and bilberries. The bilberry seems to be the only fruit in Kamschatka. A few patches of potatoes and cabbages occasionally surround the better villages; but, unless at Melcova, there are no cereals, although it is stated that rye would do very well in some parts of the valley of the

Kamschatka River. The harvest of the river and the sea is enough, however, to occupy all the time and thoughts of the Kamschatkan, and he has neither the leisure nor the taste for agriculture.

## RICHARD CABLE,

### THE LIGHTSHIPMAN.

#### CHAPTER XXIX.—CUTTING THE CABLE.

JOSEPHINE's spirits went up like a cork in water when she left Hanford. She liked Lady Brentwood. She was fond of society, and the society met at Brentwood Hall was usually agreeable. Lady Brentwood was an admirable hostess; the baronet, a cheery, kind man who rather petted and flattered Josephine. But these were not the prime causes of her exhilaration. She was rejoiced for a few hours to be free of Richard, who was to her a constant cause of anxiety and annoyance. She, in her way, was feeling the same reaction that rushed over Richard when he came among his friends at the *Anchor*. She asked herself now why she had married him, and was not able at once to find the true answer. She had, in fact, taken him for several reasons. She never had really loved him; but she had been grateful to him, and she had been attracted by his simplicity, integrity, and manliness—by the contrast he presented to her father. But perversity had had its part in bringing her to marry Richard. She knew that by so doing she would anger her father and offend her aunt; and having lost all respect for both, she went headlong in a course which, because disapproved by them, she argued must be right. Without any fixed standards of right, she was swayed by her impulses, often good, but sometimes exaggerated till all the goodness was lost. She had felt her need of a guide; but Richard was useless to her; he was a drag, an encumbrance, a cause of perplexity. Now, she recognised the justice of her father's opposition, and regretted that she had not received it with respect. In her self-condemnation she was drawn towards her father as she had never been drawn before. She had revolted against his contemptuous disregard for truth and cynical disparagement of sincerity. Now, she began to see that he was not wholly in the wrong. Truth, sincerity, are raw and rude virtues, not to be taken up in their natural state in the lump, but to be minced, and spiced, and rolled into forced-meat balls, or tucked into pâtés, and garnished and glossed over, and served round as a *hors-d'œuvre*. Life is not to be sustained thereon; they are to be picked at and taken in small portions at the end of a fork.

Naked truth is a savage virtue fit only for naked savages, suitable to an age when men ate acorns and beechmast. Civilisation from its first initiation was a covering up and disguising of truth. No cultured man speaks the bare truth to his neighbour, but rubs off its edges and smooths and polishes it. The bare truth blinds like the sun, and must be looked at through smoked glass. The perfectly true man is insufferable to every man he comes in contact with. Aristotle may have called the perfect man *tetragonos*, four-square, but such a man is full of angles, which impinge on and bruise his neigh-

bours. Everything in life is full of disguise; truth is enveloped in as many coverings as a Chinese ivory carved puzzle-ball—the charm lies in the sculpture of the coats, not in the pip within. Our clothing, from the first apron of leaves, is disguise; our speech is the veil we throw over our thoughts; the courtesies of life are the figments which interpose between us and our fellows, to prevent our coming to blows. These thoughts passed through Josephine's brain; and she began to admit that her father was not so much in fault as she had supposed, and that she was premature in condemning him. She gravitated towards him, now that she was in this humour; and his quick observation showed him that he had acquired an ascendancy over her he had not previously possessed.

When they were at Brentwood Hall, some time elapsed before dinner, whilst their hostess was engaged. Then Josephine took her father's arm, and they wandered together into the conservatory. He saw that she desired to speak with him on what was uppermost in her breast, yet was shy of opening the subject. 'Do you care for begonias, papa?' she asked. 'I think they are not attractive plants. They have nothing but their colour in their favour.—Oh, do look at the maiden-hair fern. How prettily it is grown in cork along the walls; and see! it springs up luxuriantly in every cranny between the joints of the pavement. It will not flourish thus with us.'

'It wants warmth, and hates a draught. To every plant, a proper climate is needed that it may thrive. Bring the coarse bracken in here, and it will spindle; put a maiden-hair out of doors, and it will languish.'

'What a pity it is, papa, that there is no managing a fernery at our place. The pipes heat the vines and flowers; and if another house were added on, there would not be heat enough to warm it. It is a pity Cousin Gabriel contrived his greenhouses so badly that there is no enlarging them without complete reconstruction.'

'My dear, we should build our houses and shape our futures without corners for pities to lodge.'

'What do you mean, papa?'

'I mean, that we should well consider what we are about to do; and then, when we have acted, we shall not be exclaiming: "What a pity! what a pity! I did not see this before." In all our plans, we should contrive to let the pities be outside, like the vents for sewage gas.'

Josephine knew that her father was thinking of her and what she had done. 'We cannot always help ourselves; the pities will come.'

'They may come, where forethought has been exercised; where it has not, they will come.'

'And when they are there?'

'We must get rid of them if we can.'

'That is easier said than done,' observed Josephine.

To which her father remarked in answer: 'Where there is a will there is a way.'

They walked on together for some little way without speaking; but presently, Mr Cornellis said with a tone of voice that conveyed a sneer: 'Among the many pities that occur, there is one strikes me with peculiar force at this moment—that the Wadi el Arabah is dry.'

'Why so?'

'Because, if there were water-communication between the Gulf of Akabah and the Dead Sea, that intelligent and adventuresome sailor, your good husband, might be sent in the yacht to Jericho.'

'Papa!' Josephine sighed.

'As there is not,' pursued Mr Cornellis, 'might he not be induced to attempt the north-west passage? There would be, to be sure, the chance of his getting crystallised in an iceberg—like a mastodon.'

Josephine shrank from her father; she unlocked her arm from his; his tone offended her.

'One thing is certain,' said he. 'Richard is reduced to abject misery; he is weary of life among us. I give him his due. He knows he is out of his element. He wants but a touch to convert his rotary orbit about you into a parabola, with a perihelion at remote intervals.'

He waited a few minutes for her to speak, but she said nothing. Her face was troubled.

'It is said,' continued Mr Cornellis, 'that if you give a man rope enough, he will hang himself.—You, my dear'—he looked at her out of the corners of his eyes—'you have been given plenty of Cable, and are beginning to throttle—in self-defence, you must cut your Cable.'

This was all that passed between them, but it sufficed. Her father had shown Josephine the only way out of her present difficulties. The alienation must be made complete; she and her husband must separate without scandal, with mutual consent. Each was in a wrong position, and felt uncomfortable. But would Richard as readily agree to this arrangement as herself? He loved her, and she did not love him. He had his nice notions of duty, which might keep him dangling about her. But there was a greater impediment than this—his children. Would he be induced to leave them? Would he be persuaded to depart with them? How could she even suggest to him that he should do this? For the first time, she felt an impatience of the children boil up in her. 'Little cumbersome pests!' she said, as she put on her bracelets, but she did not allude to the bracelets.

She was beautifully dressed at dinner—a creamy white silk with orange flowers and lace; round her neck was a chain of pearls. She looked strikingly beautiful. Her clear olive cheek was flushed with excitement, and her large brown eyes were full of light. By day, the white would not have suited her complexion; but it was otherwise at night. She was taken into dinner by the baronet, and she exerted herself to be agreeable. Sir John was a very old friend, whom she had known since she was a child, one who had humoured and encouraged her, and laughed at her sharp speeches. Not a word did he say about Richard. He expressed no regret that he was not present. He asked her about her voyage, about Heligoland and Bremerhaven, and Hamburg and the Danish Isles, which she had visited on her wedding tour. He had a yacht of his own, and at one time had gone about in it a good deal; but of late years he had felt his age, and given up the boat to his son. As we get old, we do not lose our love of the amusements of our youth; but we feel the labour that attends them, and the effort we make in taking our pleasure neutralises the pleasure itself.

On the other side of Josephine sat Captain Sellwood, who had taken into dinner a heavy young lady. The captain made a few cumbrous attempts at conversation, which fell dead, and were followed by periods of silence.

'I hear the discharge of minute-guns,' said Josephine in a low tone to him. 'You and your convoy make no way. I am a fast clipper, and have come to the rescue.'

She was in good spirits. She was sorry for the captain, whom she had affronted when he proposed to her, and she was eager now to make all the amends in her power. Accordingly, when not engaged with Sir John, she threw herself with energy into the difficult task of waking up and maintaining a conversation with Captain Sellwood and his partner. She was only partially successful. She was like a boy trying to fly a kite when there is little wind. When he runs and lugs at the string, up goes the kite; when he desists, it heads downward and lies inert upon the grass. As the captain was at her side, Josephine was not subjected to the gaze of his solemn ox-like eyes. This was a relief to her; she could not have endured the scrutiny. With some, when they look at you, you can see in their eyes what ideas they have formed, favourable or otherwise, concerning you. There is a certain amount of satisfaction in that; but with Captain Sellwood it was not possible to do so; there was no reading anything in them.

Josephine was playing an unreal part. At the bottom of her heart lay a leaden burden of care and mortification, but she gave no token of it in her conduct. Her face was full of smiles, her eyes of humour.

'When are you going back to India?' she asked of the captain.

He did not know exactly—he had a long leave of absence, on account of ill-health.

'General torpidity?' asked Josephine.

'A torpid liver—yes. Perhaps I may have to leave the army.'

Then she turned to Sir John Brentwood, and noticed Lady Brentwood bowing; so she rose, and the ladies followed her into the drawing-room. As she passed her father, she caught his eye; it said plainly: 'You are queen here now only because Richard is absent.'

The drawing-room of Brentwood House was a long room, occupying the entire garden front of the mansion. It was lit with tall Queen Anne windows, now covered with pea-green curtains embroidered with yellow and brown heart-fashions. The room was panelled and painted creamy white, the mouldings picked out with gold. All the furniture was in white and gold and pea-green. The ceiling was remarkably rich with wreaths of plaster-work flowers and fruits in the style of Grinling Gibbons. Between the windows were full-length family portraits, some of great beauty—giving colour and depth of tone to a room otherwise pale in its decorations. There was one famous painting there, by Gainsborough, of a Lady Brentwood seated by the seashore under a tree, listening to the murmur of the waves in a shell that she held to her ear. She was in white satin, with a black lace scarf thrown lightly over her head. Blue bows adorned her dress. Gulls fitted over the deep-blue sea in the background. The expres-

sion of the sweet face was one of melancholy; and a look of yearning for something far away was cleverly depicted in the eyes. That something far away was her husband, Sir Beaulieu Brentwood, who hung between another pair of windows—a gorgeous figure in crimson satin. He went by the name of Red Ruin in the family, because of the disasters he had brought on it. The picture had been painted in Italy. The dress was fantastic, worn at a masquerade, borrowed or hired from the *garde-robe* of some theatre—red stockings, slashed trunk-hose and jacket, a hat with a crimson feather.

'You are looking at Red Ruin,' said Lady Brentwood. 'Fortunately for the family, he fell abroad in a duel. He had eloped with a Roman princess, and was run through the body by the husband. If he had lived a year or two longer, the Brentwoods would now be nowhere, the estate sold, the family irretrievably impoverished.'

Josephine studied the Gainsborough.

'His poor wife,' said Lady Brentwood, 'looks like patience on a monument, smiling at grief. He deserted her, treated her shamefully, hardly allowed her enough to live upon; and yet she forgave everything, and was, I believe, the only person who wept true tears at his death. I do not think I should sigh, and look so longingly for his return, had Sir John played me these tricks. I am cast in another mould. Some folks would be glad enough to be rid of their husbands. You, my dear, have not been married long enough to know what a relief it is to be quit of them for a while.—Bless me! what is all that noise in the hall? What a clatter the servants are making.' Just then, a footman entered. 'Thompson,' she said, 'what is the meaning of this? Are you all gone mad?'

'Please, my lady, might I speak to your ladyship a moment outside?'

'What is it? I insist on knowing. What has happened? Speak out, Thompson.'

'My lady, there's—a man, a fellow got into the house in his shirt sleeves and without his hat.'

'Well, turn him out.—Is he tipsy?'

'We can't make out, my lady, exactly. The butler has had a deal of work getting him into the housekeeper's room.'

'How vexing! Send for the gamekeepers, and have him expelled. Is he insane?'

'We don't know what to make of him, my lady. He says he's come after his wife.'

'Wife—wife! She's not here. He must be tipsy.'

'He's very hot and excited, my lady; he says as his name is Cable.'

Lady Brentwood started.

Josephine's blood rushed in a wave to her heart, and then poured through all her veins, like the bore in the Severn. For a moment the room spun round and she saw nothing distinctly; but she speedily recovered herself, and with crimson brow and eyes that flamed with anger, she said: 'Let me go, dear Lady Brentwood. I will see him.' Then she left the room, with firm foot but bounding heart, and pulses in her temples that smote like hammers. 'Lead the way, Thompson!' she said

haughtily. 'The man desires, possibly, to speak with me.'

The footman conducted her along a passage and down steps to the parlour of the housekeeper, a room that smelt of preserves. She was followed by her hostess, ready to retire if need be, but desirous to be at hand to prevent scandal.

In the housekeeper's room was Richard Cable in an armchair, the butler and the housekeeper by him endeavouring to compose him. He was in a condition of great agitation. His face hot, his hair wet, he was panting for breath; his sleeves were unbuttoned at the wrist, his tie twisted to one side of his neck. His collars were limp and crumpled.

'If you will kindly leave me alone with him,' said Josephine, controlling herself, and turning to the housekeeper and butler, 'I will send him away.' Turning round, she saw Lady Brentwood in the doorway.—'Dear Lady Brentwood,' she said, going a step towards her, 'I am ashamed and grieved that you should have been disturbed. Let me manage this matter. I will dismiss him very speedily.'

Her hostess at once withdrew, and the servants disappeared. When she was left alone in the room with Richard, she stood opposite him, looking at him with angry brow and eyes that darted flashes of fire. Her teeth, her lips, her hands were clenched. Her eyebrows were contracted, so that they met above her nose. His breast was heaving; drops of sweat stood on his brow and rolled down his face like raindrops.

'Well,' she said at length, 'are you going to speak and inform me as to the reason of this new outrage? Are you bent on driving me to curse the day that I ever took your hand to raise you out of the gutter?'

He did not answer; he could not; his breath was spent; the blood boiled and sang in his ears. Perhaps he did not hear her words.

Why had he come? He did not ask himself this question. It did not occur to him to ask it. He had come, impelled by a natural instinct, not by any articulate reason. She was his wife, the one who stood nearest to him in the whole world. He had committed a crime; he was conscious of an agony of remorse and terror which filled him. To whom should he fly in such an hour of supreme pain but to his wife, to pour into her ear the story of his trouble, to ask her sympathy, her assistance?

He had not stopped to consider; had he done so, he might have hesitated; he might have doubted whether she was a person ready to meet him with open arms and comfort him in his sorrow. But he did not stay to think; he ran straight forward, thrust on by remorse. His mind was dazed with despair, incapable of thinking, and so he acted upon natural, unreasoning instinct. To whom other than a wife should he turn—the refuge of a tortured soul, the proper sharer in every sorrow, the only one who with a ray of love could enlighten the darkness which enveloped his brain and heart? Now his wife stood before him, with bare bust and arms, in white silk and lace and flowers, wearing pearls about her neck and sparkling brooches on her arms, with long white gloves, neatly buttoned, and a fan in one hand.

Richard Cable looked at her; and now, for the first time since he had started on his run, did the thought emerge out of the confusion and pain in him, that this beautiful, dazzling, stately creature was not one to solace, advise, and help him.

'What is it?' she asked in a hard tone; and as she spoke, there sprang up in her mind the recollection of her father's words, 'Cnt your Cable,' and she saw that the desired opportunity had arrived.

She waited a moment, and then said again: 'I have asked you twice, what is the meaning of this insult?' Then, with concentrated bitterness: 'Are you too tipsy to speak?'

He raised his hands and clasped his head: 'I have killed—or hurt!—'

'Whom?'

'Little Bessie! I let her fall—on the stone floor—little Bessie!' Then he broke down, covered his face with his hands, and sobbed.

She stood unmoved before him. She waited a moment for him to recover himself, then in the same hard tone she asked: 'What have you come here for?'

'For you.'

'For me? Why? Bessie is no child of mine. Go back!'

'Will you not come with me?'

'I—I go with you!' She laughed contemptuously. 'Ici je m'amuse parfaitement bien. You do not understand French. It does not matter—you can gather the sense.' She turned her back on him and left the room.

### A NIGHT WITH A VOLUNTEER LIFE-BRIGADE.

How many readers of this *Journal* have spent a night with a Volunteer Life-brigade on a rocky coast during a storm? Probably few. Yet good, humane work is done on our shores by these Brigades, and it is well that their self-denying labours should be more widely known and acknowledged. All are more or less familiar with the work of fire-brigades; indeed, the London fire-brigade has gradually won by its promptitude, its daring, and its achievements, a national position, and Englishmen speak of it with feelings of pride. Let us, then, try to interest our readers in another Brigade, not so well known as the band of brave men who rescue their fellow-creatures from a terrible death by fire, yet who have saved many lives from a watery grave during those tempestuous nights when people are most safely housed and wrapped in refreshing sleep.

The Volunteer Life-brigade was conceived on a stormy night in November 1864, at the mouth of the Tyne. The ill-fated steamer, the *Stanley*, was making for the harbour amid a blinding storm of wind, rain, and snow; but in the darkness, she missed the channel, and ran upon the rocks to the north of it. Here she grounded, about two hundred yards from the shore. Besides the usual crew, there were many passengers on board, and their cries for help during the night were heart-rending. The lifeboat was useless, since to come near those rocks with a raging sea dashing against them meant destruction. The Coastguard did their utmost to form a line of communication between the ship and the shore, but it was all in

vain. They were too few in number to fight successfully with the difficulties on that terrible night. Thousands of people, as the night sped, gathered on the shore, and all were willing, nay, anxious to help, but were powerless, since they did not know how to do it. There was the helplessness of ignorance, and also the confusion of ignorance. They ran hither and thither, or stood bewildered in their powerlessness, knowing, as hour after hour passed by, that the ship was slowly breaking up, and that the people on board, whose cries reached them only too plainly during the pauses of the tempest, were being swallowed up mouthful by mouthful by the angry, ravenous sea, and all the time they were powerless to give any assistance.

When the morning came, and the storm had somewhat abated, and the tide gone down, the remnant of the ship was there; and dead bodies were picked up, to be sorrowfully claimed and reverently interred. And what else? The minds of a few gentlemen who had been present during the night were stirred to do something, that such a disaster should not take place in the future, if any means could be devised to prevent a similar loss of life. In a few days, a small committee was established; and it was ultimately resolved to form a Brigade of Volunteers, whose self-imposed duty should be to render skilled assistance to the Coastguard. Volunteers from all classes came forward willingly; and soon four companies, of thirty men each, were formed, with a captain to each company, elected by the members.

The duty of each volunteer is to become as efficient in using the life-saving apparatus as the Coastguardmen whom they are to help. For this purpose, the Brigade is drilled at regular times all the year round in rocket-practice; for, be it remembered, that when a ship runs aground, the one great object is to establish communication between the stranded ship and the shore by means of a line or rope. Of the numerous plans devised, the rocket-apparatus is the most successful, partly because the rocket-stand is so light that one man can carry it on his shoulder, being simply a triangular framework of tubular steel, and from it the rocket is fired. The apparatus can be fixed on the rocks, or beach, or cliff, or pier, or, if need be, a boat. The rocket has a light line attached to it; and in the case of a ship, this line is sent, if possible, over the vessel between the masts. If the shot be successful, and the stranded crew know how to work the apparatus, they seize the rocket-line, haul it in as rapidly as possible, for attached to it is an endless line called the 'whip.'

(The seamen on board some ships do not know the use of the rocket-apparatus; for not many years ago, a French vessel came ashore at Hartlepool, and every man could easily have been saved, but only one was, and that by drifting ashore. When questioned about their apparent negligence in not seizing the line thrown over the ship, the man said they did not know what it meant, but thought that the English were firing upon them. A similar occurrence took place near the mouth of the Tyne.)

Well, we will suppose the 'whip' is secured to the mast, well up; the next step is to carry to the ship, by means of the whip, a strong three-inch rope, called the 'hawser.' The hawser is fastened

to the mast also, a little above the whip. A travelling block is placed on the hawser, and upon this travelling block is suspended the 'breches-buoy,' which is an ordinary cork life-buoy, with the addition of a bag of tanned canvas, with two holes in the bottom, so that the persons to be rescued may pass their legs through. When the whip is secured, 'clove-hitched' to the traveller, all is ready to carry the breches-buoy backwards and forwards along the hawser between the ship and the shore. Great care must be taken—and it is the greatest care at this stage—that there are no 'turns' in the whip, so that the travelling block may pass to and fro easily.

Having thus prepared the way, let me give my experience of a night with a Life-brigade. I am a landman, and was staying with a friend living on the north side of the mouth of the Tyne. He was a member of the Life-brigade; and on a December evening, when he came home from his daily duties, he remarked that the wind was strong from the east and steadily rising, and that a friend he had met on the way home told him the sea was 'making' fast. Showers of rain and sleet had fallen through the day, and the bank of clouds to the east gave every appearance of a 'nasty night' at sea, as darkness closed in.

We partook of tea; and in the well-lighted, comfortable room, my friend, his wife, and family were enjoying the evening, when about seven o'clock the conversation and laughter were brought suddenly to an end by a loud report. 'The guns! Listen!' said my friend Frank. A second report. 'Two; but wait for an answer, and make sure,' he said. In about a minute's time, two cannon were fired in quick succession. A short pause was made, and then little Jack broke silence eagerly with: 'On the north shore, father; you will have to go.'—'Yes, my boy. I hope we shall have a successful night, and that no time will be lost.' And at once he went to prepare for his duties as a Life-brigade man.

During his absence from the room, Mrs Holmes explained to me that a battery placed on the cliff at the mouth of the river fired two guns if the man on the lookout gave notice of a ship in danger on the north side of the harbour; and three guns on the south side. And to make sure that the Brigaden men throughout the whole of the borough should know, Her Majesty's ship *Castor*, anchored in the river, and used for the purpose of training the men of the Royal Naval Reserve, answered back with two or three shots, as the case might be. Nothing stirs the hearts of the people at the mouth of the Tyne so much as 'the guns.' Almost every one has friends aboard ship, and a vessel in danger may mean the life of some friend, near and dear, in peril.

In a couple of minutes Frank returned to the sitting-room in his flat-topped sailor cap, a blue jersey, and a strong, light-coloured, worsted belt round his waist, with the initials of the Brigade worked upon it. The belt is worn in order to enable the men to get a good grip of each other when clambering the cliffs, and so on. I expressed a wish to go to the shore; and Frank agreeing, I got ready, and we set off for the Life-brigade watchhouse on the cliff. In a blinding storm of sleet and rain, we hurried on, and in twenty minutes came to the Brigade-house. This is a comfortable wooden house, with a watch-tower

at one end—tables, chairs, and seats in the main part of the building; and snug, half-closet beds arranged at the other end, where a good fire was blazing. Some sixty or seventy men had already arrived, and each was told off to his post. A doctor had made his appearance, and was prepared to give every assistance to drenched and perishing seamen. The chief-officer of the Coastguard at this station had the rocket-apparatus ready to distribute to the different divisions; all ropes and tackle were in due order; and the word was given to march to the end of the north pier, as the men in the lookout tower were confident a ship was in distress there.

As an outsider, I could only look on and hang about the outskirts of the Brigade. I admired the earnestness with which everything was done, and the cool way that the captains kept their younger members from losing their heads. In a short time, a move was made, and rapidly the Brigade with their apparatus took the best road, although a little about, to the pier. I followed as closely as I could; for, although I knew the ground fairly well by daylight, I found that on a dark stormy night I should soon be lost, and go over a cliff before I was aware of being in danger. A lantern here and there among the Brigade showed where they were, but seemed to make the darkness still darker. There were many onlookers besides myself, and keeping together, we seemed to be a protection to each other. All turned down the dip under the castle rock, and hurried along the pier, the wind driving the rain and sleet against us; and the flakes of spume or sea-foam which were whirling about occasionally made a dab against our faces.

The vessel—which afterwards proved to be one of those iron screw colliers so common on this coast—had struck on the end of the unfinished pier, and as it was low water at the time, it was some distance off. Mr Brown, the chief of the Coastguard, with his men, led the way, and had charge of the rocket-apparatus. Soon all was fixed, and the rocket rushed with its hissing kind of roar towards the stranded ship; but what with the darkness, the sudden gusts of wind driving the sleet and rain, the doubts as to the precise position of the vessel, and the difficulties experienced at night, which all Life-brigaden men know so well, it was not till the third shot that the crew got hold of the line and secured it to the mast. With reasonable promptitude they drew in the whip, and got a hawser made fast, when the steamer gave an ugly lurch. She was, in fact, fast settling down, for the hole made in her iron side was a large one. The breches-buoy was sent off, and two passages made successfully; but the rescued ones told the men to make all haste, for the ship could not hold together as she was for long. The cradle went a third time to the vessel; but there appeared to be some negligence at this point. My friend, who told me all this afterwards—for I could only guess at the time what was going forward—was of opinion that the ship was filling so fast that the seamen were trying some other and more rapid means of safety, for no response was made when the buoy went across the third time. Of course all this was only guesswork, since it was pitch-dark, with sleet and rain driving all the time. Frank told me that the minute they waited seemed like half an hour,

when in a moment the vessel heeled over, snapped the whip, and a parting shout—so it appeared—from the mariners told the Brigade that some other means must be used to save them.

The body of the Brigade now broke up at the end of the pier, and came rushing past us (the spectators), and disappeared in the darkness, while shouts here and there from comrades were heard telling of each other's whereabouts. It appears they thought that the crew would take advantage of such lifebelts and other floating articles as they possessed, and try to drift ashore; and being ebb-tide, the water on the inner side of the pier just covered the blocks and large stones visible at the foot of the masonry at low water, and the men mostly clambered down there, hoping to find some of the crew drifting towards them. They did manage to rescue three men, but it was almost as dangerous for the rescuers as the rescued. Two of the men picked up were exhausted, but conscious. They were carried to the Brigade-house, and the ordinary means were quite sufficient to put them right. But the third was found apparently lifeless; and one of the doctors of the Brigade, with help from some of the members, laboured for half an hour before they were rewarded by signs of animation.

When the ship went down, I made my way back to the watchhouse, and on the outskirts picked up this information; and as I had been about two hours exposed to the pitiless storm, with little means of shelter, I returned to the home of my friend. I sat comfortably over the fire, chatting with Mrs Holmes, and thinking over the experience of the evening, with the words running in my mind:

Ye gentlemen of England,  
Who sit at home at ease,  
Oh, little do you think upon  
The dangers of the seas.

I envied the members of the Brigade the feelings they must have when they succeed in saving lives on such a night as that now passing; and my imagination began to picture scenes of seamen greeting anxious wives and families, who, but for the philanthropic labours of the Life-brigade, would be bereft of their bread-winners.

But my wandering thoughts were recalled about midnight by the arrival of my friend Frank. Supper now appeared on the table as if by magic, for Mrs Holmes knew well enough that Brigade-work in real earnest on a 'nasty night' is no child's-play; and although warm coffee is provided in the Brigade-house for the members, some substantial refreshment is needed on returning from duty. During supper, my friend confirmed the impressions I had received of the night's events, and added: 'When I came away, no other bodies had been found; and we shall have to wait till morning to know the exact state of the case. I heard in leaving, however, a rumour that Robson, of Number Three Company, was missing by his friends. He was last seen climbing down to the rocks, and it is feared that a large wave suddenly came upon him and washed him off. Out of a crew of eighteen men, we have rescued four or five, so far as we know, and probably lost one of our own men. The lifeboat was useless, for it would have got entangled

among the rocks. At anyrate, we must wait till morning to know how things really are. A sufficient number of men remain on duty for the rest of the night to render any assistance that may be needed.'

In a few days I returned to my inland home; but when the storm is raging, especially from easterly quarters, I live over again the two hours I spent on the sea-coast with the Volunteer Life-brigade; and next morning I cast an eager glance over the newspapers, to learn what has taken place at the different stations where I know Life-brigades are placed; and with the brief accounts thus given, I can easily fill up the outlines and make the scenes on the shore overnight my own.

'And is this desirable?' says some one.

Certainly it is. To enlarge one's sphere of existence, to widen our sympathies, is to live more truly and fully. Look at old men who have lived in a narrow sphere, and have passed year after year in a routine of work which was simply mechanical, how stunted in mind they have become! How different they are from those philanthropic, active men who have tried to bless others in various ways! The world teems with interest to such in every quarter; it is to them an ever-moving diorama; and as the scenes undergo transformation, you will find they pass away from the canvas in brighter and happier colours than they came on, for the handiwork of kind-hearted labourers will tell where they have been. Human sympathy is the sunshine of the world.

## CHECKMATED.

### CHAPTER II.

THE fear which had haunted Chester, despite of all Mr Ernest Gadham's kindness, that the gentleman would lose sight of him in more important business, proved groundless. He was at Chester's almost daily, meeting Geoffrey there, but only once or twice, as the young man came in the evening, Mr Gadham usually leaving earlier. He was very patronising to the young fellow, was quite magnificent in his offers of assistance, or rather in his promises to speak to divers eminent firms in his behalf. Yet Geoffrey did not take to him; and the more he was patronised, the less he liked his patron.

Not so was it with David; he was never tired of talking to Geoffrey about the friend they had made; and when, one afternoon, Gadham offered him the use, as he phrased it, of twenty pounds, he was more than ever ready to admire 'young Mr Ernest.' 'I do not mean to give it you,' said that gentleman, as he shook twenty sovereigns from his purse on to the table with an air of supreme indifference, as if such sums and such coins had, from excessive familiarity, ceased to interest him; 'but you shall pay me when you have been with my friend Sir Peter's firm for a year. I say this, because I know you were always of an independent turn. If you do not get the situation, of course you will not think of paying it. I will just take a "memo." of it.'

The 'memo.' was on stamped paper, and already drawn out. Chester signed readily enough, because there was the money, sufficient to put

him 'to rights' once more, and he had known nowhere where he could turn for such a sum; so why should he hesitate or criticise? The bill he had signed said nothing about any situation, it was true, and it was made payable to some strange name; his clerical habits enabled him to note these points; but if Mr Gadham preferred this form, why should he object?

The landlord and the baker, David's only creditors, were at once dealt with in a manner satisfactory to all parties; and the better raiment in which David now appeared was due to a visit paid to the poor man's banker, the pawnbroker, who had held charge of David's 'Sunday clothes' for some months past.

Mr Gadham on this day prolonged his visit considerably, and on the next called for Josie and Minnie, to give them a drive round the parks, the latter having obtained a half-holiday. The girls were delighted with the excursion, which to them seemed to be reaching quite the apex of fashionable life, and they came home all blushes and exultation at the remembrance of the aristocratic circles in which they had been moving, and, it is possible, in belief of the admiration they had attracted.

What Geoffrey thought of the matter was hardly made plain by his remarks; but the reflections of Mr Chester, as he sat apart and smoked his pipe in the twilight, took a strange colouring. 'It seems hardly possible,' thought the old clerk; 'but if Mr Ernest's attention to our Josie don't mean something, I am no judge. It is hardly fair to Geoffrey; and though this is, of course, a fine chance for Josie, yet, somehow or other, I don't quite like it. I would rather see the girl left in her own circle.'

David was not the only member of the family who had a suspicion in this direction, for Minnie was continually launching jokes and mysterious innuendoes, which told on her sister, confusing her and flushing her cheeks and brow, yet pleasing her, beyond doubt. She infinitely preferred Geoffrey, but what girl of nineteen could be insensible to such a conquest?

On the day after this excursion, David received a letter from Mr Gadham, desiring him to be at a certain office in the city, where he would meet the writer, who wished to see him *on a matter of the highest importance*. This was trebly underlined.

'A situation for me, and a better one than he had expected,' thought David.

The office appointed was not exactly a mercantile office, such as he had expected to find. It was a dull, gloomy house, let out in floors, as the inscriptions at the door clearly showed, to lawyers, and on the ground-floor were 'Ellitt and Barrable, Solicitors'—the names he had been given. 'I hope it is nothing in the man-in-possession way, or the serving of writs, or anything of that kind,' he muttered; 'I am sure I shall not like that.'

The room he entered was dull; a few heavy leathern chairs were in it, and a large table strewn with bundles of writings and the like, after the fashion of a solicitor's office; and at this table was seated the only occupant of the room, Mr Ernest Gadham. That gentleman started up and welcomed David, congratulating him upon his punctuality.

'I have preferred to speak to you personally, Mr Chester,' he continued, 'rather than allow my solicitors to open the matter to you, although it is, of course, in their way of business. I thought you would rather talk it over with a friend, in the first instance.'

'You are very kind, sir; I am much obliged to you,' said David, as the other paused.

'An extraordinary discovery has been made,' resumed Mr Gadham.—'The fact is, Chester, my father's will—his true, his proper will—has been found. It is witnessed by yourself and Sperbrow, your fellow-clerk; and the whole of the property is left to me—it is mine!'

'Good-ness me a-live!' gasped the clerk; 'this is news indeed! And how was it found, sir, and where has it been all this time?'

'Both turn out to be the simplest matters possible,' returned Mr Gadham. 'The will was made, as you know, and as you can swear so far as your own signature is concerned.'

'To be sure I can,' exclaimed David; 'and glad I shall be to do so.—But I beg your pardon, Mr Ernest; please go on.'

'A Mr Harrison, a solicitor, was sometimes employed by my father in legal matters, although not his regular attorney. A short time before his death, he sent to the solicitor a packet of papers referring to some hopeless debts; and my father dying soon after, they were thrust into a room devoted to such rubbish. After a time, Mr Harrison also died; and then nobody knew or cared anything about these papers, which were indeed as a whole of no value to any one, and the only wonder is that they were not burned or sold to the paper-mills. But lawyers are a careful race; and on the chambers being let, when Mr Harrison's affairs were settled and the business transferred—only the other day—a man was employed to examine these papers, and among them he found my father's will! Whether the old man had thought to hide it there, and afterwards forgot it; whether he fancied it would be safer there than elsewhere; or whether it was merely an accident, will now, we may be sure, never be known. The document is in the hands of my solicitors, who will lose no time in reclaiming my property. We have sent for you, David, to know if you can unhesitatingly swear to having witnessed such a will?'

'Swear! I should think I could! I forget the date, but yet I remember the day as well as if it was yesterday. I remember Sperbrow making a little joke over our fees.—He's dead, poor fellow, you tell me?'

A few more questions were asked by Mr Gadham, all of which were answered by David in a manner which evidently gave satisfaction to the gentleman. The latter then proposed a glass of dry sherry, so drew a decanter and glasses from a cupboard and poured out a liberal measure.

David made quite a neat speech in proposing health and success to his patron. Gadham shook hands with him, and declared that as soon as he should be settled in his rights, he would see that his old friend David should be placed above the necessity of seeking any more situations—no more toil for him and his.

'Him and his!' thought David; that was Josie. He hardly liked the idea of behaving unfairly

to Geoffrey; but even if he made up his mind, could he be sure of Josie? The tempers and whims of women were so unreasonable, that she might— But surely, with such a chance she would not be perverse!

'And now, Mr Chester,' said Ernest, 'I will call the gentleman who has charge of my affairs, and settle your part of the business at once.' He rose, and going into the next room, returned almost directly with a gentleman, whom he introduced as Mr Elliott. This was a stern-looking man, with bushy black whiskers and beard, no moustache, but thick penthouse-like brows, which added markedly to the harsh character of his face.

'This is Mr David Chester,' said Gadham, introducing the old clerk, 'the witness to the will; Mr Elliott.'

The lawyer looked keenly at David for a few seconds from beneath his overhanging brows, during which scrutiny David, although he knew there could be nothing to find fault with in himself, felt very uncomfortable.

'A very suitable man, I should say, for a witness,' said Mr Elliott, which even at the moment appeared an odd form of expression. 'Then we will take your affidavit, Mr Chester. Here is the will. You remember it, I have no doubt; and here is your signature. The signature below it is of course Sperbrow's.'

'I do not remember the will at all,' said David, 'for I saw nothing of it, except where I signed. That is my signature, and that is Sperbrow's; but—'

'But what, my friend?' asked Mr Gadham, with a smile. Before speaking, however, he had interchanged a glance with the solicitor, in which neither of them had smiled. 'But what, David?—Speak out.'

'It does not matter. I must have been mistaken; but I fancied Sperbrow signed above me. However, there it is.'

'Yes; there it is; and, as you correctly say, you must have been mistaken,' interposed Mr Elliott. 'The material point is for you to swear to your signature. Here is the affidavit. I will read it over to you.'

The solicitor accordingly read a good deal of what sounded like so much jargon to the clerk; but among it all there was, he could distinctly understand, his declaration that he had witnessed the will of Mr Peter Gadham, at the latter's request, and, of necessity, in his presence. Then, observing certain formalities prescribed by the solicitor, he signed, and the business for the present was over. David thereupon left, both gentlemen shaking hands warmly with him.

'Surely, Mr Ernest means to marry Josie,' said old David to himself as he walked home, thinking of what Gadham had said. He unconsciously held up his head rather more than usual as he walked along. As he turned into his street with an air which was positively buoyant, whom should he meet but Geoffrey Coyne!

The young fellow coming up with his usual friendly smile, and speaking in his usual cheerful tone, much of the effect of David's recent meditations vanished at once, and he found himself treating Geoffrey as heartily as though no visions of a more influential son-in-law had ever crossed his mind.

'Can you spare me one minute before going

in?' asked Geoffrey. 'I have a few words of some importance to say to you.'

'With pleasure, my boy,' replied David; but as he uttered the words, he seemed to hear the faint echo of the trouble which had but recently left his mind.

The young man was silent until they had turned into a half-finished, little-frequented square hard by.

'I thought I would tell you at once,' began Geoffrey. 'I believe you will be pleased at what I have to say; I am sure I hope you will. It is only to say that we—I mean, of course, Josie and myself—are engaged; and I hope to be able to marry within the year. That is all.'

'Oh!—That is all, is it?' said Chester. He made such a pause before answering, and spoke in so queer a voice, that the young man looked round in some surprise.

'That is all,' he returned; 'excepting that I am happy to tell you of a promise I have had from our principal. I saw him at his house yesterday. He gave me a promise which I think justified me in asking Josie to be my wife.'

'And she accepted you, I suppose, as you say you are engaged?' returned David, slighting the reference to the important interview with the principal, and still speaking in a lethargic manner.

'To be sure she did!' exclaimed the young man. 'Have we not been sweethearts, so to speak, ever since we were children at the same day school! I daresay I told her a hundred times, before I was ten years old, that she was to be my little wife; and now, you see, it will be true, after all.—Come, Mr Chester; rouse yourself!' A friendly shake of the arm accompanied this speech. 'Say that you are glad to hear my news, and that you wish us joy. I am sure you do.'

'O yes!—no doubt, I do,' replied David, with a desperate gulp. 'But you must make some allowance for my astonishment. I was thinking of—of a subject so totally different, as I came along, that I could hardly bring my mind to—to understand such a surprising announcement.'

'I was in hope that there would have been nothing of a surprise in it; I thought I had made my feelings pretty clear. But I am forgetting all about my chief's promise. We will walk round the square once more, while I tell you my good news and what my prospects are. If there is one man in the world, above all others, who will rejoice to hear it, that man is yourself.'

David heard the explanation of his friend, and parted from him in as friendly a style and with as good a grace as he could assume. It was but a brief parting, as Geoffrey told him he should be round again in the evening. His ship was to sail soon, so he could not afford to lose any time. It seemed certain that this would be his last voyage, for the promise given by his chief included permanent and profitable employment on shore as his own private clerk, a post much coveted by a person in the position of Geoffrey.

On entering his house, the clerk noted the brightened eye and heightened colour of his daughter, who was evidently nervous and excited while getting his tea, and looked wistfully at her father ever and anon, expecting him to speak, as he could see plainly enough.

He had been sadly disappointed by hearing, in all the flush of his new hope and new ambition, Geoffrey's announcement; yet he did not blame the young people for this, knowing that only a short time before it was the news which he would have been delighted to hear. So, with an effort, he mastered his feelings, and said: 'Well, Josie—I met Geoffrey Coyne up the street, and what do you think he told me?'

'I believe I know, father. I hope it has made you as happy as it has made me. We have known Geoffrey so long, and he is so good and so truthful.' This was evidently cold, tame praise compared with what her heart prompted, for her eyes were moist as she spoke, and her colour deepened.

'Did you never have any ambition to rise above his—I mean, our sphere?' said David. 'Did you never fancy you might make a—a loftier match? Not a better, as regards the young man, certainly not; but that is, you see, I mean a wealthier—a—a'—His speech faded out here, while he was conscious that he was not doing very well, and that Josie was staring at him in amazement.

'Wealthier and loftier!' exclaimed the girl. 'Not I, father, even if I could have had the chance. But the days are past for fairy princes, or kings' sons and Cinderellas. We shall be quite happy as we are; and we shall live close to you, of course.'

Josie ran on in this strain for a good while. Her heart was so full of her new happiness, that she did not dream of watching to detect in her father's face anything which might appear like a shadow of trouble in the midst of all this brightness.

The week which elapsed before Geoffrey sailed was, in one important respect, a very quiet one; no news reached Chester about the impending lawsuit, and no visit from Mr Gadham was made. But it so happened that on the very next day after Geoffrey had sailed, Mr Gadham called upon David. The visitor was all good temper and compliments.

'A treat now and then for you and your young people, I may promise,' said Gadham. 'I have thought of one or two little excursions which I am sure would please Miss Josie, who, I find, has seen scarcely anything of the world. With your permission, then, I will call for her now and then, and we will try to see the best of the country outside London. I used to think myself a pretty fair guide; I must polish up my memory.'

Josie was out when this speech was made, at which David was glad; but Mr Ernest prolonged his visit until the girl returned. When Josie came in, Mr Gadham was more loquacious than before, offering all sorts of treats to her and to Minnie, and Josie recalled, with a little shudder, what her father had said about a wealthier lover. She knew at once what the speech had meant. It was impossible for a young feminine mind not to feel a trifle dazzled by such a preference, about which Minnie had so often jested with her. Now, however, there seemed no jesting; and now, too, she did not admire Mr Gadham so much as at one time she had persuaded herself she did. This change of feeling may have been due to Geoffrey's influence.

The discovery had one good effect—it put her on her guard, and prevented her from committing herself by various promises which, in the heedlessness of her ignorance, she might have spoken. David was silent as regarded his visitor when he left; so was Josie; but Minnie made up for their taciturnity by chattering about the numerous trips they were to make, the sights they were to see, and the general outshining of all their friends which was to follow.

Josie and Minnie were going out to make one or two small purchases—an event not quite so rare, since the loan of the twenty pounds, as before—and were standing at the parlour-window with their bonnets on, saying a few words to their father, when a tap was heard at the door. Supposing this to be the landlady, or one of the family, for the reader has no doubt divined, much earlier in our history, that David was not a householder, he gave the usual command of 'Come in.'

The tapper complied. It was a tall gentleman, whose broad shoulders, black beard, whiskers, and heavy brows, David recognised as having recently seen, although for the moment he could not remember when or where.

'I must apologise for my abrupt appearance,' said the gentleman, lifting his hat to Josie and Minnie; 'but on coming to the outside door, I saw an elderly lady, who, in answer to my inquiry for you, directed me to knock here. My name is Ellitt.—You remember me, Mr Chester?'

'Oh, certainly!' exclaimed David, who now recalled the solicitor at whose office he had sworn his affidavit.—'Pray, come in, Mr Ellitt. These are my daughters—Josie and Minnie.'

'I am pleased to see them,' returned the solicitor, who looked at the girls with a glance keener than ever—so David thought; unpleasantly searching and harsh, the girls felt it. The latter went out at once, supposing, as Minnie said, that the gentleman had come to talk business.

'I daresay he has,' said Josie, as they turned out of the little garden; 'but who do you think he is? Why, he is the man who came up to Mr Gadham at the theatre, just as he was going to speak to us. I did not like his look at all.'

'And I am sure I don't like it, and never shall,' said the outspoken Minnie, and the sisters discussed Mr Ellitt unfavourably as they pursued their tour.

'My errand here is a business one,' said Mr Ellitt to David, 'as you may suppose, but I am glad it has had a pleasant cast given to it by my seeing your daughters. I have heard of them—at least, of Miss Josie, the elder. I had heard of her good looks, but had no idea she was so strikingly handsome.'

'She is pretty,' returned the clerk, who was easily led to talk upon this subject, as well as on many others. 'Everybody thinks so. Too many think so, I may almost say.'

'Cannot be too many, Mr Chester,' said the visitor cheerfully. 'She will find a rich husband some day.'

'She is engaged to be married to a very nice young fellow,' replied David. 'As for a rich husband—Well, who knows?' said the old man in his simplicity.

Mr Ellitt laughed heartily at this, as at a good jest; then displaying more interest in the subject

than might have been expected, he followed up his inquiry; and, ere he left the theme, David had given a number of tolerably clear and strong hints as to Mr Gadham's attachment.

If this introductory discussion could scarcely be called business, the same could not be said of that which followed. Another discovery had been made, slight enough in itself, yet of value as bringing out strongly the fact that Sperbrow knew he had signed his employer's will. Among the miscellaneous papers stowed away with the will, a brief note had turned up, addressed to Sperbrow, and the presumption was that this had been written by David. 'Here is the document,' concluded the solicitor, laying a letter on the table. 'It is only signed D. C.; but of necessity it must have been you who wrote it, and you will no doubt remember doing so.'

'I don't remember it in the least,' said Chester, after putting on his spectacles and examining the document.—'It is certainly like my writing, and I do not believe there was any other D. C. about the place; yet I never wrote that letter.'

'Would it not be more feasible to suppose you have forgotten it, Mr Chester? You will recall it, I am confident, on reflection. We must prove it, if possible; the death of Sperbrow makes it important.'

'I shall not recollect it, if I try for a week,' returned David, shaking his head gravely. 'I never wrote to Sperbrow on that or, I should say, any other subject.'

'You ought to make an effort, you really ought, when you think how generously Mr Ernest intends to behave to you. I have seen the figures; but, as a professional man, I cannot reveal them. Besides'—he paused ere continuing this sentence, and gave a peculiar smile—'there are your other expectations. All may depend upon the identification of this note.'

'How can I identify a note which—which I can't identify?' said David. He felt that this was hardly a neat form of speech, but he could not help stumbling.

'You are making a difficulty where none should exist,' persisted the lawyer. 'You know that you must have written this note—that no one else could have done so. You have indeed owned that there was no other D. C. in the firm. Use your memory, Mr Chester!'

'I am doing so,' responded David, growing a trifle dogged in his manner under this pressure; 'and the more I think of it, the less I believe I wrote that letter. That is my answer, and I should say that was enough.'

There was a great deal more said on both sides; but at last Mr Ellitt smilingly observed that he supposed nothing more could be done that night, and left.

### TAKING THINGS COOLLY.

OUR neighbours across the Channel are fond of relating humorous little incidents of *sang froid* in which an Englishman usually acts the rôle of chief character. As, for instance: A man entered a furniture-shop and said: 'Have you any old furniture?'—'No, sir; but we can make you some!' This reminds us of the Englishman in a restaurant who called for stale bread. 'We have none, my lord.'—'Make some, then; I will

wait,' was the calm reply. Instances of remarkable coolness and assurance amongst adventurers 'out West' are only to be expected. To begin with a small example. A boy who comes of a chronically borrowing family, went to a neighbour's for a cup of sour milk. 'I haven't got anything but sweet milk,' said the woman pettishly.—'I'll wait till it sours,' said the obliging youth, sinking into a chair.

But in many of the cases now under consideration, foreigners of several nationalities will be found to have figured conspicuously in the matter of taking things coolly.

It is related that a lady and gentleman came to a ferry, and the boatman deputed his grandson to row them across. 'Why do you not manage your boat yourself,' asked the lady, 'instead of letting this child do it?'—'Oh, don't you be afraid, ma'am,' answered the ferryman; 'the lad can swim.'

Equally indifferent to the fate of others was one of the sufferers by a late railway accident. He was seen rushing anxiously about, when some one asked if he was hurt. 'No; but I can't find my umbrella.'

About a year ago, when the upper part of an hotel was on fire, one of the servant-girls was directed to awaken two gentlemen who were asleep in an up-stairs room. She knocked at the door, and, with the greatest simplicity, said: 'I beg pardon, gentlemen, for disturbing you, but the house is on fire.' This case of what may be called ludicrous politeness brings to mind another. 'Hi! you dropped a brick up there!' shouted a pedestrian on whose shoulder one of those articles had fallen from a three-story scaffold.—'All right,' cheerfully responded the bricklayer; 'you needn't take the trouble to bring it up.'

'What is the matter?' asked a lawyer of his coachman. 'The horses are running away, sir.'—'Can't you pull them up?' 'I am afraid not.'—'Then,' said the lawyer after judicial delay, 'run into something cheap.'

Lawyers remind us of judicial matters, and the latter have often to do with the career of burglars. To one of these nocturnal visitors, who had entered a gentleman's bedroom, and was seen standing in front of the bureau, the question was put by the roused sleeper: 'Well, what do you want here?' 'I want money and bonds,' hissed the burglar through his clenched teeth, 'and quick about it too.'—'My friend,' returned the occupant of the bed, 'I've been looking for those things for the last twenty years without success. But go on with your burglary; I'm sleepy.'

Another cool business character, on leaving the city for a trip to Paris with his family, placed a placard just inside the hall door, couched in the following language: 'To Burglars.—All my plated jewellery and other valuables are in the Safe Deposit Company's vaults. The trunks, cupboards, &c., contain nothing but second-hand clothing, too bulky to remove, on which you would realise comparatively little. The keys are in the left-hand top drawer of the sideboard. You will also find there a cheque to bearer for twenty pounds, which will remunerate you for your loss of time and disappointment. Please, wipe your feet on the mat, and don't spill any candle-grease on the carpets.'

The facetious writer of such a notice must surely have been a relative of the gentleman who, on being told by a beggar whom he refused 'to tip,' that he would commit suicide with a razor, asked him to do it outside, and not spoil his floor.

There is a probably well-known little humorous account of an Irishman who went to the theatre for the first time. Just as the curtain descended on the first act, an engine in the basement exploded, and he was blown through the roof, coming down in the next street. After coming to his senses, he asked: 'An' what piece do yez play next?'

A Danish officer is pictured to us making observations in regard to the deviation of rifle bullets. One day, when walking on the ramparts at Düppel, he saw a Prussian sharpshooter taking aim at him. While the soldier placed himself against a tree, in order to take a steadier aim, the officer raised his glass to watch his movements. 'This is all right,' said he; 'the musket is just on a line with my breast—we shall see!' The trigger was pulled, and the Danish officer quietly wrote down: 'At a distance of about five hundred yards, the deviation of a ball from a rifled musket is about one metre.'

A certain American sea-captain was a perfect philosopher, and no amount of ill-luck ever depressed his faith or good spirits. Coming into the harbour once with an empty ship, after a three years' cruise, he was boarded by a townsman, who inquired: 'Wal, cap'n, how many barrels? Had a good voyage?'—'No,' responded the skipper. 'I hain't got a barrel of ile aboard. But,' said he, rubbing his horny palms with satisfaction, while his hard features relaxed into a smile, 'I've had a mighty good sail.'

Another imperturbable character was the hero of the following little incident. A gentleman was travelling in a smoking compartment on the Midland Railway, and at a certain station a German entered the carriage and took his seat opposite him. When the train had started, the foreigner, noticing the other's Havana, inquired if he could oblige him with a cigar. The Englishman, astonished at the request, reluctantly pulled out his case, and saw with disgust the other select the best he could find, and take a match from his pocket and light it. After taking a few puffs with evident enjoyment, the German, beaming at his companion through his spectacles, affably continued: 'I could not haf droubled you, but I had a match in mein boggit, and I did not know what to do mit it.'

Blondin is said to have given the following caution to a nervous man whom he was carrying on his back across the Niagara Falls: 'I must request you to sit quiet, or I shall have to put you down.'

The wife of a Parisian returning home, rang at her own door. Nobody came, so she rang again. Still nobody appeared. Finally, at a louder and longer ring, the man-servant concluded to show himself. 'Pray, are you deaf?' said the lady.—'I beg pardon, madame,' said he tranquilly, 'but I heard only the third ring.'

That servant's remarkable composure was quite equalled by a countrywoman's of his employer's, who entered the house of one of her lady friends

on her usual day for receiving visitors. 'Dear me, what has happened? you look so pleased,' said the lady of the house.—'My dear,' replied her visitor, 'I am quite proud of myself. Only fancy, while driving here, my coachman, clumsy fellow, did not observe a gentleman who was crossing the street; the horses ran against him, knocked him over, and sent him rolling in the mud.—Well, would you believe it? I wasn't frightened a bit.'

A Spaniard can prove not a whit behind other Europeans in acting with provoking coolness when it so pleases him. A traveller, on reaching a Spanish country town, went to a shoemaker, as one of his boots needed repair. He found the honest tradesman reclining in the shade in front of his cottage and smoking. 'Could you mend me this boot at once?' he inquired. The worthy master looked at him, made no reply, but called his wife. 'How much money have we left?' he said. The wife pulled out an old leather purse and counted the money. 'Twelve pesetas.'—'That is enough for to-day and to-morrow,' observed the shoemaker; and added, lazily: 'No, sir; I cannot comply with your wish.'

The ladies, we should think, would not recommend the cool behaviour of a Danish bridegroom on his wedding day to be extensively imitated. A wedding was arranged to take place at a little church in the north of Jütland. The bride was there to the minute; but the indispensable bridegroom was long in making his appearance. At last he came, carrying a spade on his shoulders. The railway had been snowed up, and not wishing to miss the chance of earning an honest penny, he had helped to clear the line. Putting down the spade, he went into the church. At the conclusion of the ceremony, he escorted his bride to the church door, where he left her, as if nothing had happened, and walked off to the railway to indulge in the useful pastime of clearing away the snow. Reaching his home after dark, he expressed his satisfaction at having killed two birds with one stone.

But perhaps few instances in the way of treating the affairs of life with calm equanimity are more amusing than the one with which we conclude. Professor B—, of the university of Bonn, is a very absent-minded man. He was busily engaged in solving some scientific problem. The servant hastily opened the door of his studio and announced a great family event. 'A little stranger has arrived.' 'Eh?'—'There is a little boy.' 'Little boy! Well, ask him what he wants.'

#### FULFILMENT OR COINCIDENCE?

TOWARDS the end of the second decade in the present century, there stood, on the southern borders of Yorkshire, a fine old Elizabethan house, called Holyoake Manor, which for several generations had belonged to an old Yorkshire family named Holyoake. At the commencement of our story, the only surviving members of the family were Squire Holyoake and his son Harry, a highly promising young man of nineteen. Those who were intimate with the Holyoakes were often heard to say that two happier men than the Squire and his handsome son did not exist; and

their merry company, and in particular the younger man's, was sought far and near.

In his twentieth year, young Harry Holyoake was sent by his father to Cambridge, to complete a hitherto somewhat erratic educational career; and several months after his departure, the Squire was seized with a worse than usual attack of his old enemy, the gout. Now, the most amiable of temperaments will sometimes give way under the agonies of such a complaint; and the Squire, thoroughly good-natured and kind-hearted though he naturally was, proved, on this occasion at least, no exception to the rule. News was brought to him one morning, during a severe attack of pain, that a strange tribe of gypsies had encamped in the park adjoining the house, and that neither by threats nor by entreaties could they be induced to leave. This so enraged the sick man, that he determined he would himself drive out the intruders. He was well known as a man who, whether for good or evil, never violated his word; and accordingly, a few days later, he, with considerable difficulty, succeeded in reaching the encampment. The first person he encountered was a withered-looking old gypsy woman, who, seeing him approach, advanced with tottering steps to meet him, evidently bent upon conciliation; but the thought that, for the first time in his life, he was being bearded, on his own domains too, by a parcel of thieving rogues, as he called them, for the moment quite overpowered the Squire's better nature, and in a fit of irrepresible rage, and before any of the athletic-looking gypsies standing around could interfere, he seized the old woman by her straggling gray locks, and after belabouring her with a stout cudgel which he carried, flung her, with his remaining strength, bleeding and half-senseless, upon the ground.

After a few moments of dead silence, during which the Squire's better feelings had reasserted themselves, the woman slowly rose, and, with intense malignancy glaring out of her sunken bloodshot eyes, over one of which a thin stream of blood trickled, addressed him thus: 'A curse—the curse of the old gypsy queen alight on you and yours for ever! For this work of to-day, you shall live to see the last of your race and home, and then you will remember the gypsy's words.'

The Squire was momentarily appalled at the depth of hatred which accompanied the words; and before he had quite recovered his accustomed equanimity, the encampment, at a sign from the old woman, was being rapidly broken up; and a few minutes later the hindmost of the tribe was seen disappearing among the trees.

Some six months after these events, as the Squire was one morning about to sit down to a rather late breakfast, an important-looking letter, bearing the Cambridge postmark of that period, was placed in his hands. If the covering looked important, the contents, to judge by the pallor that overspread the Squire's usually rubicund face as he perused the lines, must have been infinitely more so. After gazing for a while in a vague, helpless manner, first at his faithful old attendant, and finally around the comfortable-looking room, he suddenly started to his feet, and in concentrated tones ejaculated: 'He, a Holyoake, to do it! Curse him! a thousand times curse him!' The old attendant was startled still

more immediately after to see his master, whom he had known and loved since a child, fling himself upon the floor and burst into uncontrollable grief, murmuring brokenly: 'My boy, my own dear boy! Even your death I would gladly have welcomed before this.'

The news gradually leaked out that Harry Holyoake had brought disgrace upon the old name—that he had long been suspected of cheating at cards; that one night, while heavy with drink, he had been undeniably caught in the act, and had in consequence been summarily expelled the university.

The day following the receipt of this announcement, another letter was received from Harry himself, stating that he could never again face his father after the disgrace, and begging the Squire to accept the care of his (Harry's) wife—to whom, it was now known, he had been clandestinely married at Cambridge—and little child. Before the Squire had decided upon his reply, the young wife and child arrived at the manor, and were kindly enough received. The child was several months old, and his endearing little ways quickly won the old man's heart.

Of Harry, nothing more was heard for many years.

Twenty years slipped rapidly by, and the incidents already related were well-nigh forgotten in the neighbourhood of the manor. Harry's wife had died shortly after her arrival; but the child had grown up into a stalwart, handsome young fellow, the darling of his grandfather's heart, and the pride of the whole country-side. The young Squire, as he was universally called, was first everywhere and in everything; there was no more fearless rider in the hunting-field than he, nor a more active partner in the ballroom. On his twenty-first birthday there were great rejoicings at the manor, which was wholly given up to feasting and merriment in honour of the occasion. It had been a long-standing arrangement that Everard—he had been named after his grandsire—should, on attaining his majority, spend a few months' holiday on the continent, in conjunction with a young man of somewhat similar age, named Dick Houghton, the son of a neighbouring Squire. Accordingly, the festivities over, the young men started, full of health and spirits, for their projected trip.

One wild, tempestuous night towards the close of January 18—, a man, closely wrapped in a great-coat, and wearing a full dark beard, might have been seen, apparently with no specific object in view, walking down one of the narrow, reputable-looking streets diverging from the Rue de S— to the river-side. Externally, there was nothing about this man deserving other than a casual attention; but could one have divested him of the disguise which he wore in the shape of the full beard referred to, and effaced the slight limp which showed itself as he walked, the consternation that would have been manifested by the criminal portion of the *quartier* would have been unbounded, for he was no other than Monsieur Jules Bertholot, the most renowned of the Parisian police of that day, and the especial fear and aversion of Parisian criminals; the man who was

indeed popularly supposed to be gifted with second-sight, so successful did his professional ventures generally prove. It was well known that a gang of more than usually lawless desperadoes infested the *quartier*, and it was more than suspected that their headquarters were situated in the narrow street down which Monsieur Bertholot was now limping. The master-spirit and leader of the gang, and by far the most daring and reckless of them all, was said to be an Englishman, who, thanks to a long residence in Paris—which had probably obliterated any insular eccentricities that might otherwise have betrayed him—had hitherto managed to elude a highly deserved punishment.

We need hardly say that Monsieur Bertholot was on the track of these men. Not many days previously he had visited, as usual disguised, one of the numerous drinking saloons by the riverside, where he had been struck by the general superiority of one of the frequenters over the rest of the *habitués*. The slight, indeed almost imperceptible foreign accent of the man further impressed him, and he decided upon cultivating his acquaintance. This he did, with the result that in a few days he, the prince of the Parisian police, found himself wholly hand-in-glove with the very man who had so long baffled him.

It had been arranged that this night the gang was to be taken. After limping some distance down the street, the detective halted before a large sombre-looking house, the door of which he tapped in a peculiar manner. After a pause, the door was cautiously opened, and Monsieur Bertholot entered, and followed his conductor some distance along a labyrinth of intensely dark rooms and passages, and finally stopped before a door, through the chinks of which a brilliant light was visible. After some more cabalistic tapping, the door was thrown open, and Monsieur Bertholot found himself—not for the first time—in a room with a long table running its entire length, around which sat some twenty or thirty men, intent upon a game of hazard. The new arrival, after a boisterous welcome, seated himself near to two young men, who, with eager flushed faces, were absorbed in the game.

The play had proceeded for some time with apparently varying luck, when one of the young men suddenly sprang to his feet, and directly charged the leader, a determined-looking man of near middle age, with foul-play. The words were no sooner uttered than a pistol report rang out sharp and clear, and the young man's body fell heavily forward upon the table at the instant the door was burst open, and a body of police filled the room and secured the ruffians, who were too much taken by surprise to make any resistance.

It transpired at the trial that the murdered man was one Everard Holyoake, of Holyoake Manor, Yorkshire. From the moment this was known, the demeanour of the accused underwent a complete change; his callous indifference disappeared; and he seemed as one overwhelmed with remorse and grief. That night he managed to commit suicide in his cell, and a piece of paper was found upon him in which it was stated that the dead man was his own and only son!

The terrible news nearly killed old Squire Holyoake. But his cup was not even yet full. One evening, after the inmates of the manor

had retired for the night, it was discovered that the house was in flames; and though all escaped with life, the structure by the next day was a mass of smouldering ruins. Some of the neighbours had seen a tribe of gypsies in the vicinity on the night of the fire, and one man had detected two members of the tribe lurking near the house. Nothing, however, was definitely proved, for the gypsies had disappeared as mysteriously as they had come.

The Squire did not long survive this last blow; he died soon after, bitterly regretting his harsh treatment of the old gypsy woman, and firmly persuaded that his misfortunes were due solely to her execration.

#### OUT AT SEA.

I know that I am dying, mate; so fetch the Bible here,  
What's laid unopened in the chest for five-and-twenty  
year;  
And bring a light along of you, and read a bit to me,  
Who haven't heard a word of it since first I came to  
sea.

It's five-and-twenty year, lad, since she went to her  
rest  
Who put that there old Bible at the bottom of my chest;  
And I can well remember the words she says to me:  
'Now, don't forget to read it, Tom, when you get out to  
sea.'

And I never thought about it, mate, for it clean slipped  
from my head;  
But when I come from that first voyage, the dear old  
girl was dead.  
And the neighbours told me, while I stood as still as  
still can be,  
That she prayed for me and blessed me as was just  
gone out to sea.

And then I shipped again, mate, and forgot the Bible  
there,  
For I never give a thought to it, a-sailing everywhere;  
But now that I am dying, you can read a bit to me,  
As seems to think about it, now I'm ill and down at  
sea.

And find a little prayer, lad, and say it up right loud,  
So that the Lord can hear it, if it finds Him in a crowd.  
I can scarce hear what you're saying for the wind that  
howls to lee;  
But the Lord'll hear above it all, for He's been out at  
sea.

It's set in very dark, mate; and I think I'll say good-  
night.  
But stop—look there! why, mate, why, Bill, the cabin's  
turning light;  
And the dear old mother's standing there as give the  
book to me!  
All right; I'm coming! Bill, good-bye! My soul's  
going out to sea!

## THE INFLUENCE OF THE STORY-BOOK.

IN all ages and in all lands, the art of narrating a story by word of mouth or by the ready pen has been practised; and a few individuals among the rest of mankind have been gifted with this faculty, which they have exercised in preparing food for the fancy of their hearers or readers in fable, epic, or the modern novel. These few are akin to the artist who differs from the mere portrait-painter. The last-named can produce a resemblance which may be perfect in light and shade, and even in expression; but though this may give us pleasure, it does not stir in us the admiration that we award to one who can produce a situation calling forth our emotions. The faculty which is able to produce this is much more rarely met with.

A well-told tale is as rare as a perfect day; it is the result of happy influences, and, like a well-developed man or woman, requires favourable circumstances for its development. It owes much of its interest to the language used in telling it, and the skill with which it is illustrated, as in the plays of Shakspeare. The plots of many of these plays are not original; but the way in which the author has made, from what were originally but phantoms, galleries of life-like figures, is a striking proof of his power. A similar effect is often produced by writers of tales.

It shows great merit in a story when the incidents of it linger long in the memory. *Silas Marner*, by George Eliot, is a remarkable instance of this quality. Any one who has read this tale must have noted the ease with which each incident may be recalled, even a long time after it has been read; and this characteristic seems to result from its being free from superfluous matter, from the way in which the main incidents are grouped, and from the beauty and simplicity of the *tout ensemble*.

Love and war, with the troubles resulting therefrom, form the materials of most of the ancient stories; while the situations of the modern novels are the results of complicated difficulties

incident to a more advanced stage of civilisation. Life abounds in incidents for the modern tale-writer. There are many people who confine their generosity to what they consider their own class, and who spend time and money in deeds of charity, yet think nothing of wounding the feelings of those a little beneath them in rank. They are kind after their own fashion, but would sacrifice their dearest friends rather than lose an inch of their hard-won social station. Such people are common both in real life and in novels, and when the story of their doings is well told it excites in the reader much interest.

To read a good story has a similar effect to spending a few hours in pleasant company; it cheers and relieves the mind; the small troubles that may have vexed us lose their hold upon us; and when we return to them, we are so refreshed and invigorated by the action of change, that they weigh but lightly upon us. Sometimes an incident recalls to our memories some of the pleasures and pains of that brief season of early youth of which we all like to prolong the remembrance. Stories from other lands have a great charm for young people and children; there is for them the novelty of learning about foreign customs, and seeing that human nature is alike in its deep experiences, under very different outward ways and manners.

The beauty of many simple stories, some of them of a past age, yields us as much wonder and admiration as the more lengthy and artistic compositions of to-day, from which they differ as the wild-flower does from the more gorgeous production of the hothouse. Thus the bloom of the common furze, with its outer petals protected with down, and its brilliant yellow colour set off by dark prickly foliage, well repays close inspection. So does a homely story. We have many of them in the world's literature. We will mention a few, without regard to order of merit. There are the English *Vicar of Wakefield* and *Robinson Crusoe*; some of the American tales by Nathaniel Hawthorne; the German *Undine*;

and for the young, *Elizabeth, or the Exiles of Siberia*; and numberless others that blossom in every language.

Among modern novel writers, we sometimes meet with one who can sketch out the plot of a story, but cannot fill in the finer details. A story, like a statue, may be rough-hewn, or it may be carved and finished by the patient toil of the skilled artist. There is nothing to object to in a rough-hewn story; we know of one or two that we should be sorry not to have read. Our objection is to one in which the details are not filled-in in a consistent manner, and in which the characters are made to act as we feel no real persons would act. This kind of tale is often hastily produced by the fashionable novelist; but it is soon forgotten, and cannot take a lasting place in literature. They please in some cases, before the taste is acquired for better productions; as a youth, before he has learnt to draw, may be attracted by a gaily painted picture, in which, after he has gained some knowledge of art, he finds many defects.

We meet in books with all sorts of people pictured for our amusement. Almost all classes of society have had among them some one who has portrayed the incidents and characters that grow out of different social conditions, as most of our best stories are the results of the writers' personal experience of life. Thackeray, who had lived among the aristocracy, has dispelled many an illusion as to their freedom from vulgar faults, in pictures that we feel are almost as truthful as reflections in a mirror. Dickens and Mrs Gaskell have shown us that there are subjects of interest even amid the flats and plains of humble life, and display to us as exciting scenes as we meet with among the great. Mrs Gaskell began to exercise her talent for writing through the want of an absorbing occupation to abate the feeling of loneliness caused by the death of a child. Exercising this talent benefits the writer as well as the reader, by affording scope for the higher faculties. In George Eliot's series of tales we see the different degrees of middle-class country-life drawn with skill both as to general effect and minute detail, especially in her earlier works; the later ones often contain too much philosophical matter; this sometimes breaks the interest of the story.

People in the country who have long uninterrupted winter evenings appreciate the sensation novel to an extent that those who live among the more real excitements of London or other large towns can hardly realise. To the latter, life is seen to be full of touching experiences, and they are familiar with the reverses of fortune. And sometimes situations in novels that are intended to rouse great emotion, do not appear to them to be so real: they are quicker to detect their extravagance and inconsistency, than the less experienced dwellers in country places.

Who that has watched a young girl absorbed in the reading of a story-book, her face beaming with genuine emotion; or a boy leaving for a time the rough games that boys delight in, for a tale of peril and adventure, is not thankful to the writer for providing our young friends with so much innocent amusement, to fill up what would be otherwise vacant hours, and to supply the need of the young for something different

from the ordinary every-day wants of life—we want that shows itself in their dreams of future travel and adventure—and to put before them heroic ideals for their imitation? And when sometimes we who are grown up have spent half an hour of an evening talking with a friend and recalling old favourite tales, are we not glad that we have a subject of such interest to talk about? We feel that impressions more lasting than perishable ink and paper have been left upon our minds; and we are thankful for the time that we have snatched from the more practical duties of life, to indulge our love for that fascinating class of literature which comes under the head of fiction. We learn to value the presence of the novelist amid life's scenes, as we should the one guest at a party of pleasure to whom, among the many that contribute to our entertainment, we owe the most, and who gives enjoyment alike to old and young. To make another comparison: reading a story which depicts life in unaccustomed forms, is like a visit to a spot where nature displays rare and uncommon beauty, and wild-flowers bloom of varied hues, delighting us all the more because they do not develop their fragrance in the grimy town where our working hours are spent.

## RICHARD CABLE,

THE LIGHTSHIPMAN.

### CHAPTER XXX.—NOT TO BE RESPLICED.

ON the modern stage, when persons have to disappear or properties to be removed without interruption of scenes, a steam or smoke is raised, or veils of imperceptible gauze are let down, behind which the requisite operations can be performed unobserved by the spectators. Similar appliances have been in use on the social stage for many generations to disguise what we do not wish to be seen. It was so on this occasion. The movement of social entertainment went on uninterrupted; the gentlemen came from their wine; the tea was handed round; ladies sang and performed on the piano; Lady Brentwood had agreeable things to say to all her guests; the smoke of small-talk and the veil etiquette screened the unpleasant episode which had just been enacted, and which had created some disturbance.

The hostess herself knew no particulars, and she was careful to ask no questions. When Josephine reappeared, she covered her embarrassment cleverly by thanking her for having fetched her music, and insisting on her taking her place at the piano and giving the company one of her charming songs. Josephine went to her portfolio and took out the first piece that met her hand without particularly noticing what it was. She knew perfectly all the pieces she had put together, and there needed no choosing where music is used not as a delectation, but as a cover to the voices of talkers. When she took her place on the stool and unfolded the paper, she found that she had selected the mermaid's song from *Oberon*. She struck the first chords listlessly, and then regretted that she had taken this piece, for with the air came over her the recollection of the lightship and of Dicky Cable's whistle. 'I will never, never sing it again,' she

thought as she closed it. 'That is the last of the Mermaid.'

Next day, Lady Brentwood persuaded Josephine and her father to prolong their visit over another night. There was a garden-party that afternoon, and another dinner in the evening, when a very musical acquaintance, a man who wrote critiques in some of the papers, a man steeped in Wagner to the chin, was coming; and Josephine, said her host, would be sure to like to meet him and discuss Wagner with him and the merits of her favourite Weber. Josephine was a heretic; she despised Mendelssohn, thought him a great prophet of musical commonplace, and had shocked Lady Brentwood. 'My dear,' she said, 'we will refer the matter to Mr Wayland Smith; you must stop for dinner, and hear what he has to say about Mendelssohn. I daresay you may be right about these Songs without Words, but none but a master could have written the Scotch Symphony.'

So Josephine and her father remained; and at table her hostess managed to set Mr Wayland Smith next to her, though he did not take her in to dinner. Josephine was passionately fond of music, but she had not had extended opportunities of hearing much. Her father took her to town occasionally to concerts and the opera; but, after all, the circle of operas performed in town is a small one—*Trovatore*, *Roberto*, the *Prophète*, *Rigoletto*—now and then *Lohengrin*, *Trovatore* again, *toujours Trovatore*. Mr Wayland Smith had gone through a German course, hated Italian music, and had much to say about composers of whom the English musical world knew nothing, and whom, therefore, it despised—Marschner, Lorzing, Nicolai, &c.

Josephine spent a very enjoyable evening. She sang for Mr Wayland Smith, and very good-humouredly and frankly accepted his criticisms. He looked over her portfolio, and with a blue pencil scored some of her pieces. 'When you get home,' he said, 'tear these to fragments and strew them to the winds; it is worse than waste of time to play rubbish.'

Josephine quite forgot about Richard Cable and his injured child, in the interest she felt in the conversation of the musical critic. She made him write down a list of pieces for her to get and learn.

'I knew,' said Lady Brentwood, 'that you would enjoy yourself when I persuaded you to stay.'

'Dear Lady Brentwood, I have not spent such a pleasant evening for a long time. I forgot all my worries.'

'You have worries?'

'Like every one else. But—I am glad now to learn that I am not alone in my heresy. Mr Wayland Smith shrugged his shoulders over Mendelssohn, and said the Songs without Words were fit only for school-girls.'

Josephine had banished her worries from her thoughts while at Brentwood House; but when she returned to Hanford they returned with renewed force to disturb her peace. Her conscience, which had slept whilst away from home, now uncoiled and stretched itself. She felt qualms at the recollection of her treatment of Richard.

Her father had asked no questions about what

had happened; he seemed to have divined all. As she descended from the carriage, and he gave her his hand, he said: 'Take care—no respicing of cut Cables.' In no other way did he allude to what had occurred.

Richard was not at the house when they arrived. He did not come out into the porch to meet her. She hardly expected to see him, yet she felt disappointed that he was not there.

'Is Mr Cable about the garden?' she asked of the butler.

'No, ma'am; he's not been here for some time.

—There's been an accident, ma'am.'

'Is the child much hurt?' she inquired with a slight tremor in her voice.

'I do not know, ma'am, for certain. Shall I send the boy down to inquire how the young lady is?'

Young lady! Tiny Bessie, a young lady! What condescension of John Thomas to call the poor little child, the sailor's babe, a young lady!

'Never mind,' she answered. 'I daresay I shall step down myself and ask. The case is not serious?'

The butler bowed, put his hand to his mouth to cover a cough, and said in an apologetic tone: 'Certainly not, ma'am—only the spine is injured, and the child will be a cripple for life.'

Josephine shuddered and turned white. Then she went up-stairs; her hands shook as she removed her bonnet. What should she do? Ought she not to go at once to the cottage? She and her father had lunched at Brentwood, and did not return till the afternoon. As she sat and thought what line of conduct she should pursue, the first bell rang for dinner. She dressed hastily. It was too late for her to go then. Perhaps she would run down after dinner.

Josephine could not eat anything at dinner; she picked the food in her plate, and sent it away. She could not talk; she had lost her interest in Wagner, and her prejudice against Mendelssohn. Her aunt asked whom she had met at Brentwood, and how she had amused herself; and her father watched her; she changed colour during dinner several times, and complained of the heat, though the evening was cold. She was thinking of Bessie, the poor little blue-eyed, fair-haired child, that had put its little fingers to her mouth, and whose palm she had kissed. This little creature crippled for life—a whole future darkened! How had the accident happened? Richard was so careful, how came he to let the child fall? Josephine knew how his heart was wrapped about his little ones, how especially dear to him was that innocent babe, and she knew that he must be suffering acutely. He had been suffering whilst she had been enjoying herself. Whilst she had been discussing Mendelssohn with Mr Wayland Smith, he had been eagerly questioning the surgeon as to the life of the sufferer. Richard would never forgive her for her want of sympathy. She had cut her Cable indeed—through and through, with sharp knife and remorseless hand.

She could not remain with her aunt in the drawing-room after dinner; she went into the hall and threw a shawl over her head and wrapped it round her neck. Now she was cold, shivering. A moment ago she was hardly able to breathe, and was fanning herself because of the heat.

Her father came out of the dining-room. 'Whither are you wandering, my pretty maid?' he asked. 'After poppies and nightingales?'

'Papa,' she said, 'I must go. It is wicked not to make inquiries. I cannot send; I must go myself. Richard will never forgive me.'

'Well,' said he coldly, 'it is best as it is. Good words will not mend broken bones. You have missed the chance, if you sought reconciliation. It is too late now. I will go to the cottage and make inquiries. Let matters take their course. Penelope unstitched at night what she had sewn in the day. Do not you try to sew up what you have unravelled.' He took her shawl off her shoulders. She submitted, and went back into the parlour to her aunt. He was right; it was too late.

Josephine retired early to bed; she was too uneasy to talk or settle to anything. When in bed, she could not sleep. Her mind became restlessly active; every trouble doubled itself in bulk. Wrongs done her grew in grievousness, her own faults darkened in colour. When she thought of the annoyance Richard had caused her by his ill-considered action in coming to Brentwood, her veins glowed, her head throbbed, and her eyes burnt in their sockets. She could not forgive this—this humiliation, to which he had subjected her before her hostess and the servants of the house. If he took offence at her conduct, it was unreasonable of him; the aggravation had been excessive. If he refused to be reconciled, it was well that it should be so; she could be happy without him; it was abundantly proved that she could not be happy with him. Next moment, she thought of Richard running to seek her, to pour out his grief into her bosom. She saw him, under the starlit sky, in his shirt sleeves, running with the sweat streaming from his face, and his breath issuing in snorts through his nostrils. Why had he come for her, instead of going straight home to his child? He had run to her in perfect reliance on her goodness of heart and ready sympathy. She was ashamed of herself; she had wounded his heart where it was most susceptible. She resolved, in spite of her father's advice, to go to the cottage next morning, acknowledge her fault, and make her peace with Richard. Then she saw rise up before her in the darkness of her room the white form of Gainsborough's Lady Brentwood, with the shell to her ear, listening to the roar of the sea, with a far-off, wistful, longing look in her eyes. Would she—Josephine—ever feel such a longing for her husband as Lady Brentwood had for Red Ruin? No—that was not possible. A woman might lose her heart to a rake in satin and velvet, might forgive infidelities; but she could not love a common sailor, and pardon a lapse in grammar. Red Ruin had deserted his wife, but he did not put his knife in his mouth; he had eloped with a princess, but he had held fast to the letters *h* and *v*. Therefore, it was quite permissible and possible that Lady Brentwood should feel tenderness for Sir Beaulieu; but she, Josephine, could never experience such a yearning of the soul for her husband, were he to be absent and become indifferent. The clock struck four before she fell asleep.

When she woke, she had come round to her father's opinion—that the breach having once been

made, it must not be filled in. She regretted that she had appeared unfeeling in the matter of little Bessie; but we cannot pick our occasions, and if Richard came to interrupt her with unwelcome news when she was engaged—she very naturally lost her temper and spoke unsympathetically. A rupture with Richard was inevitable; the occasion had come; it was not quite such as she would have chosen, but having come, she must take advantage of it. It would pave the way to a separation, and Richard might be induced to leave Hanford. If he would not go, she was resolved to depart herself; they could not live together in the same place in different houses and moving in different social spheres.

In this mood she abode the whole forenoon; but after lunch, she sat in the garden by herself. Aunt Judith had gone up-stairs to take a nap; her father was away with the agent who had called. Then a reaction set in, and she felt that she had been heartless. Her better self prevailed. Her pride stood in the way for some while, but went down at last. She tried to stay it up with the thought that Richard could not care much for her, or he would have returned to the Hall; but her efforts availed nothing.

She rose from the garden seat, went through the gate, and walked to the cottage, without saying a word to any one.

The elder children were at school, to be out of the way. Mrs Cable had gone to the surgery for medicine; and when Josephine entered the house, Richard was there alone in the kitchen, watching and soothing the baby.

He looked up as she entered. He was on one knee by the cradle; the afternoon sun streamed in at the little window on his face and dazzled him, so that at first he was unable to distinguish his visitor. Josephine noticed a change in him. His cheeks seemed to have fallen in; his eyes were hollow, and his hair had lost its spring and curl. The temples stood out, but the flesh had sunk into pits beneath them. He looked ten years older. But she saw that there was change of another sort in his face as well. The expression was altered. The light, the trust had vanished from it; its frank kindness had disappeared. Across the brows lay deep furrows, and the mouth was contracted. The man was not so much oldened as embittered.

'Richard!' said Josephine, 'I have come to know the truth about dear little Bessie.'

He started at her voice; the furrows on his brow became deeper, and his teeth clenched, giving his jaw a heavy look it never had worn before. He put up his hand to shade his eyes from the sun, and he looked steadily at her for a minute without answering. In the shadow of his hand, his eyes looked large and threatening. Presently, in a strangely altered voice, he said: 'Bessie is no child of yours, and concerns you not.'

'I beg your pardon, Richard,' said Josephine, after a constrained pause. She was hurt by his rebuff, though she acknowledged to her heart that it was deserved. 'I am sorry that I spoke petulantly the other night; but you must acknowledge that you did a very unwise thing—certain to exasperate me. You put me in a most awkward dilemma.'

She waited for a reply. None came. 'Tell me, Richard, is poor dear Bessie gravely injured?

I have heard no particulars. Tell me how it happened.'

'How it happened!' he repeated hoarsely, and rose to his feet, because he could not bear the sun on his face as he spoke with her. 'Ay! I will tell you how it happened.—Stand off! Do not come near the child. Away from this side. The shadow of you has fallen on her and fallen on me already. Your shadow blights.'

In truth, she had stepped into the sunbeam and had intercepted it. Now she moved on one side; she was humbled, not greatly, nor had she changed her determination, bred of her father's advice, to separate from Cable; but she was touched and pained by the sight of the suffering child, and its equally suffering father.

'I will tell you all,' he said in a tone charged with suppressed thunder. 'You were right when you said at Brentwood that I was drunk. It is true I was drunk when I did it. It was because I was drunk that I let my Bessie fall. I had rather, ten thousand times, have broken my own back and lain a crippled, tortured creature thus—through an eternity—than have hurt her. That God knows—if—if He knows and cares for aught that goes on below.' He did not salute, as he named the Almighty, as in the former times.

'I am very, very sorry, Richard.'

'I do not want your compassion,' he retorted fiercely. 'I loathe it—I despise it. It was your doing that my poor baby lies here'—

'Richard,' interrupted Josephine, with a flash of anger at what she conceived his injustice, 'because you forgot your self-respect and drank, and let Bessie fall, am I to be blamed? This is too much.'

'I do blame you,' he said. 'It is all your doing. Was I ever drunk before? Never—never! My mother can tell you that. And why did I drink at the *Anchor*, but because you had stung and insulted me past endurance! I forget my self-respect! I had none. You had kicked it and trampled it in the dirt. You had killed it. I always held up my head and could check myself. I never did anything that could bring shame on my face, and tears in my mother's eyes before, because I respected myself. But you would not rest till you had beaten my self-respect down and ground it into dust. I drank because of the pain in my heart, and to forget what you had done to me. Then—after poor Bessie was hurt—I ran to find you. Now, I see I was mad or drunk to run to one so heartless, so cruel; but in the moment of my despair, I forgot all the wrong you had dealt me, and remembered only the tie that bound us. I ran to you, because I was burning with thirst, as a man in a desert runs when he sees, far away, green leaves that promise a well. I ran to you for pity and love, and you mocked and drove me from you.' His breath came with a hoarse rattle from his labouring lungs. 'And now you have come to see the wreck you have made; not of my sweet baby only—but of me—of me.' He came up to her with every muscle in his face and throat distended, and with clenched hands and nerves that stood as knots in his wrists and arms.

Josephine stepped back. 'Are you going to strike me, Richard?'

'No,' he said; 'I do not touch women. I almost wish I could seize you by the throat and wring your venomous tongue out, as I might tear out the sting of a wasp.—I love you no more. I loved you once, loved you!—you stood far above me as the silver moon. I thought you the most beautiful and holy and pure of beings; and now I see your soul is full of ugly pits and scars and blemishes; and your light has no warmth in it—it chills, it drives a poor stupid man like me crazed—so crazed that I have crushed and nigh killed my child. So crazed am I, that I have lost all I had once that made me happy—my content, my peace of mind, my trust. I have looked up at you, and been blasted; and now—I cannot look up at all.' He clasped his hands over his head, and stood with widespread feet and elbows, glaring at her.

'I pitied you with all my heart,' he continued, 'when you once told me that you could not look up—and then, in my folly, I thought I would take you by the hand and hold you, and put my finger under your chin, and speak to you of love and faith and the trust of a little child to a loving Father, till your tossed heart grew still, and its fret passed away, and you raised your eyes to what is above us all. But I never, never supposed that you would drag me down and blind me, so that my power of looking up should be taken from me.'

He trembled with vehemence as he spoke, and Josephine was silent; she quailed before his indignation. Then he was silent, standing looking at her; and she glanced at him, to see if there was any softening in his face, any forgiveness in his stern eyes.

'Can you not see, Richard,' she said, 'that you tried me beyond endurance? I may have lacked consideration for you, but you also failed in thought for me. Forgive me.'

'No,' he answered; 'never—never!'

'Then,' she said, 'if that be so, it is best for us to part—to separate. We both of us made a mistake. I did not know what I was about when I took you; and you over-estimated your powers when you accepted me.'

'Very well,' he said. 'We part; we see each other no more. But the past can never be undone; it can no more be repaired and made straight than the back of my poor baby, who is crippled for ever.'

'You blame me unreasonably,' remonstrated Josephine; 'you are blind to the wrongs done to me. Nothing is easier for a man who has made a mistake, than to toss the responsibility on to the back of another who is too weak to defend herself.—Let me kiss little Bessie, and then I will leave you.'

'No,' he answered; 'you shall not touch her, nor go near her.'

Then in at the door came his little troop of girls, returning from school—six, and as they entered, the sunbeam lit one golden crown after another. The sun's ray lay along the floor. Richard pointed it to his children. 'Mary, lead the way; all of you follow her; keep along in the sunbeam, and so come to me.—Leave the lady in the shadow, in the dark; do not step out of the sunbeam to her—do not let her come near you.'

The docile children obeyed, walking in line, bathed in pure light, taking care not to put one little foot into the shadow.

Richard waited till they had all come to him and were gathered round the cradle, looking lovingly, expectantly, somewhat wonderingly, up at him. Then he waved his hand to Josephine, and said: 'Go out! Hanford Hall is your home, and this cottage my home. I banish you from my roof, as you have driven me from under yours.—Go!—Would to God, when I shut the door on you, I could drive the thought of you out as well, and be rid of the evil you have brought on me and mine, as I rid myself of your presence!'

### PEARLING.

WHEN Shakspeare makes Clarence talk of seeing at the bottom of the sea

Wedges of gold, great anchors, heaps of pearl,  
Inestimable stones, unvalued jewels,

he gives expression to the old-world idea that the ocean concealed strange treasures in its depths. Probably this idea had its origin in exaggerated accounts of the eastern pearl-fisheries. Pearls are, in fact, the only gems drawn from the depths of the sea, unless coral shells for cutting cameos can be counted as such. The real treasures of ocean are those that are gathered in such marvellous abundance by the fisherman's net; and probably at the present time the Yarmouth herring-fleets bring in from the sea more valuable spoils than all the pearling fleets of the world.

But while herring-catching seems very prosaic work, there is something of romance about pearling; so at least it seems to us; but doubtless, to those engaged in the actual work, it soon becomes as monotonous and matter-of-fact a business as any other. There is, however, always just the chance of a big 'find;' but even here the popular mind is full of exaggerations. Thus, the author of *Festus* talks of the 'two points in the adventure of a diver'—

One, when a beggar, he prepares to plunge;  
One, when a prince, he rises with his pearl.

But pearls are not diamonds, and single pearls that are in themselves a fortune are rare indeed; what is more, the case is rarer still where they would become the diver's property. Pearling has now been organised into a regular business, in which the diver works for a fixed wage, and what is found in the shells he brings up belongs to his employer.

The oldest pearl-fishery in the world is that which has been worked from time immemorial on the shores of Ceylon and the opposite coast of Southern India; but at the present day the region where the pearling business is carried on most systematically and successfully lies more to the eastward, in the seas between the north-western coast of Australia on the south and Borneo and the Philippines on the north. Visitors to the Indian and Colonial Exhibition of last year will remember the great pillars glittering with mother-of-pearl shells that decorated one of the Australian courts. These were some of the 'exhibits' of the north-west Australian pearling industry. The pearls themselves were to be seen in the same

department of the Exhibition, the gem of the whole collection being the curious natural cluster known as the Great Southern Cross Pearl. Mr Streeter, the greatest living authority on such subjects, thus describes it in his recently published work on *Pearls and Pearling* (George Bell and Sons, London): 'So far as is known, it occupies an absolutely unique position in the history of pearls. It consists of a group of nine pearls, naturally grown together in so regular a manner as to form an almost perfect Latin cross. Seven pearls compose the shaft, which measures an inch and a half in length; while the two arms of the cross are formed by one pearl on each side, almost opposite to the second pearl, reckoning from the top downwards. The component pearls are of fine orient, and would be of good shape, were it not that, by mutual compression during growth, they have become slightly flattened on their opposed sides; while some of them, though round in front, are distorted into drop-shapes at the back.' The owners of the cluster value it at ten thousand pounds; but experts hold that this price is much too high. It was found in 1874 at Roeburne, near the headquarters of the Australian fishery.

Pearling began on that coast not quite twenty years ago, and, like many great and successful enterprises, it began in a very small way. At first, the shells were simply picked up on reefs left dry at low water; then rowboats with a few native divers began to work in the shallows near the shore. Now, the work is carried on in deep water by a considerable number of schooners and other smaller craft which can venture out of sight of land in search of shell-bearing reefs. The work can be carried on for only about six months of the year. The stormy season, with its occasional hurricanes, puts an effectual stop to pearling, and at that period of the year the pearlers find some work on shore, generally sheep-farming. In the fine weather, the pearling fleet is at work at various points along the two thousand miles of coast from the North-west Cape to Torres Strait. The day's work on board a pearling schooner is a hard one. Her crew usually consists of a few white men—made up of the owner and his partners, and perhaps some hired hands—and a much larger number of black men, these being generally native Australian divers, though, on some of the ships, Malays, Soolorese, and other natives of the Indian Archipelago are employed. The day begins at six A.M., when the pearl-shells collected on the previous day are examined. The shells are opened and cleared out, the body of the fish being carefully examined for pearls, the best of which are usually found wholly or partly imbedded in its soft substance. The shell itself is carefully scrutinised for pearls adhering to it; and if there are any suspicious-looking blisters on its surface, it is split up with a chisel, the result sometimes being the discovery of a pearl imbedded in the coats of the shell. Pearl-finding is of course very uncertain work; sometimes, hundreds of shells may be opened without finding anything. But the pearler has the consolation of knowing that even in such a case his work is not labour lost. As the shells are cleaned, they are piled up on the deck, to be packed, later on, in big barrels, to be sent to England and sold by auction at Mincing Lane.

And here, as in so many other things, slow and sure gains ultimately bring in more than chance strokes of good-luck, and the pearl-shells pay better than the pearls. Thus, in 1883, while the value of the shells raised was thirty thousand three hundred pounds, the value of the pearls was only six thousand pounds.

After the work of cleaning and searching the shells has been completed, there is a substantial breakfast, and then the day's fishing begins. The boats are manned, the full complement for a schooner being half a dozen. Each boat carries a white man and a number of black divers. The white man sculls the boat and superintends the day's work; the divers plunging in, coming up with the shells held in their hands, or grasped with the toes, or sometimes under the arm. They climb into the boat, rest a while, and then go down again. The day's work lasts eight hours. Each diver's shells are piled apart in the boat, for they are paid by piecework. The diver works well if one dive in eight produces a pair of shells—that is, one shellfish; and his day's take will range from ten to twenty-five. A man has been known to bring up a hundred in a day, but this would be exceptionally successful diving.

Late in the afternoon, the boats pull back to the schooner; perhaps they have been as much as six miles away from her during the day. The shells are piled on the deck, the number brought by each diver being noted to his credit. The boats are cleaned and secured for the night, and then there is dinner, after which the blacks set to work to clean ooze, mud, &c. off the shells. The opening of them is done by the white men in the morning.

Mr Streeter, whose book on *Pearls* contains a rich store of information on the modern fisheries, keeps a number of schooners employed in pearling on the Australian coast. His little fleet was specially built for the purpose, under the superintendence of an English naval officer, who also directed its first operations. Mr Streeter's vessels have not only worked on the old fishing-grounds, but they have made successful prospecting voyages for the discovery of new haunts of the pearl oyster. His agents have also introduced the use of the diving dress, one of the chief advantages of which is that it completely does away with the peril from sharks. But notwithstanding this, the old methods seem still to hold their own in the fleet, and most of the work is still done by naked native divers.

In the Torres Strait, where there is tolerably good weather at all seasons, the pearlers work all the year round. (So they nearly all do along the coast now, but are compelled to use diving dresses.) But this fishery depends almost entirely on the shell for its profits, for though pearls are found, they are of very inferior quality.

Some of the best divers employed on board of Mr Streeter's ships come from the Sooloo Archipelago, between Borneo and the Philippines, where there is a very successful native fishery. Here the natives employ several ingenious devices for getting the oysters out of water too deep for diving. One of the simplest of these is a kind of wooden rake with long curved teeth, which is sunk to the bottom by means of a heavy stone, and then towed after a canoe, and hauled up occasionally to be examined. The oyster lies on

the bottom of the sea with his shell slightly open, which closes with a grip like a vice on anything that is put into it. Thus, if any of the teeth of the rake enter the opening of a shell, the oyster seizes it immediately, and holds on to it till he is forcibly pulled off in the boat. Young pearl-divers not unfrequently come up with oysters gripping their fingers in this way. The older men know better how to handle the shell with safety. Among the Sooloo divers are some of the best in the world. Mr Haynes, Mr Streeter's agent, on one occasion saw a diver reach the bottom at seventeen and a half fathoms (one hundred and five feet), and many men can do fifteen fathoms, or, as they sometimes call it, *thirty*—that is, 'fifteen down and fifteen up.'

America possesses pearl-fisheries in the West Indies and the Gulf of California; but at present the best pearling-ground of the world is the sea-bottom to the north of Australia. Most of the pearls now supplied to the European market come from there. The supply from India and Ceylon seems to have fallen off; it is largely absorbed by India itself, where the numerous native courts alone absorb a considerable quantity of pearls. The old fisheries of the Red Sea and the Persian Gulf produce but little now. The north-west Australian coast and certain portions of the Indian Archipelago will probably long be the happy hunting-ground of the pearler. A pearl weighing forty grains was found in the Montebello Archipelago on December 26, 1884. This magnificent pearl is of the finest quality ever seen. It is perfect in shape; and it may be added, came from a very inferior shell.

## CHECKMATED.

### CHAPTER III.

DAVID's incensed visitor, Mr Ellitt, took a road very different from that which led either to his office or to his private residence. Late as was the hour, he had yet an interview to hold with Mr Ernest Gadham, who was awaiting his arrival with a great deal of uneasiness.

'Well, have you made it all right?' began Gadham. 'I suppose you have. Old David would not be a difficult man for *you* to get over.'

'Old David is a fool! He is either a fool who cannot see what is wanted of him, or he is going in for the heavy virtuous business; whichever it is, he is not the man for us.'

'His evidence in respect to this letter is not indispensable, is it? He has said and sworn enough already. I do not see the good'—

'Indispensable! Not indispensable!' angrily interrupted Ellitt, who clearly was in anything but the best of tempers. 'We may be able to do without it; but I attached a great deal of importance to the moral, if not the legal effect which the production of this letter would have. You know that as well as I do.'

'Perhaps I do,' replied Gadham. 'However, we need not quarrel about it.—What did you try as an inducement?'

'Try!' contemptuously echoed the other. 'I dangled some thousands of pounds before his eyes, and told him that he would insure them by doing this trivial service. If that will not lead him on, I do not know what will.'

'With most men, this would be enough; but he requires careful treatment. I have been thinking a good deal about him and his affairs, while I have been waiting for you.'

'I daresay you have; it is a common amusement of yours, I believe,' retorted Ellitt, the irritation of his previous speech being heightened almost to insolence.

Gadham looked at him as in wonder at his persistence in this tone; then he demanded what his companion meant. 'You appear,' he continued, 'to be seeking a quarrel. If you want one, or are tired of your share in the game, say so plainly, and I am not the man to balk your wishes.'

'I am tired of your share in the game; and since you invite me to do so, I will speak plainly. From time to time, on various pretexts, you have put off your marriage with my sister, which was an essential part of our agreement, and but for which I would never have consented to help you.'

'Ha, ha, ha!' broke out Gadham, an interruption even more offensive in its tone than the lawyer's had been.—'But I beg your pardon, Mr Ellitt; pray, go on.'

'Laugh as you like; you know it is true; and you may take this for granted as well. I mean to keep you to your bargain, and will go with you on no other conditions. Now, I learn from various sources that you are on the verge of proposing marriage to the daughter of the old fellow I have just left—to Josephine Chester. They expect it of you; the father has hinted as much to me to-night. If you mean any shuffling, you had better understand that it will not do. I will not have it, Ernest Gadham; make up your mind to that.'

The face of his listener while these words were delivered was not an agreeable study; some shades came and went upon it which, to a less excited observer than Mr Ellitt, might have worn so boding an aspect as to demand some inquiry, but he was composed when the speaker ceased.

'And this I hear from you!' he exclaimed; 'from the man who is never tired of vaunting his superior judgment and penetration! How much influence do you fancy you can bring to bear on David Chester, compared with the chance he thinks he has of seeing his daughter mistress of all my recovered wealth? You talk of dangling a thousand or two before his eyes. Why, without any pledges or sacrifice, I tempt him with the whole.'

'Oh, well! If that is your motive, I do not find so much fault with it; but you might have taken me a little into your confidence. If you had'—

'If I had,' interrupted Gadham, 'I must have done exactly as you have now forced me to do, and which I tried my utmost to avoid. Why should you or Miss Ellitt be parties to any such plan, or even know of its existence? With such a prize in view, our honest, conscientious friend will take care not to pry too closely, or even to heed any hints, should they reach him. He can afford also, as you have just found, to be superior to all minor temptations. They are not temptations to him; you are only offering him a part of his daughter's possessions.'

'There is something in that.'

'He only wants managing, and I can manage him,' continued Gadham. 'You know how near we were to a difficulty about the place where he signed his name as witness. We might easily have had a stumble there; but I had previously smoothed him over, had lent him money, and had already hinted at the greater benefit in store, so he could not be obstinate—conscientious man!—when such a friend's interest was concerned. Now you know why I proposed a slight delay in the marriage; that must not be hurried, you can see. Then, knowing all this, I hope you will keep silence on the subject, not only to others, but to me. These discussions are not pleasant.'

Ellitt was silenced, although perhaps hardly convinced; and when, after a prolonged sitting, they parted, it was with more of friendship in their words and manner than at their greeting.

'It is a narrow chance'—so ran Mr Gadham's reflections, as he went back to his room—'a near thing, but I shall pull through. When I do, Mr Ellitt, we shall see which of us will be the cat's-paw.'

Mr Gadham, indeed, was possessed of other professional friends besides Mr Ellitt, and profound as was the confidence which, as we have shown, he placed in the latter gentleman, yet he did not feel it necessary to mention to him all those whom he found it desirable to consult. It would have added to Mr Ellitt's surprise if he had known of his client's visits to certain gentlemen, and that these visits were always connected with the raising of money. Mr Gadham was supposed to have the command of a considerable sum, the result of various successful speculations abroad; a respectable fortune, in fact, although not vast enough to make him disregard the chance of securing his father's property.

The visit he paid on one particular day—destined to be a busy day with Mr Ernest—was to a person who knew better than to entertain any belief in such a fortune. Much argument on the applicant's side was required, and many references to amounts already advanced were made by the lender; but the interview may be supposed to have ended satisfactorily, as a cheque was handed to Mr Gadham, who put his name to a document which contained an acknowledgment for a sum very different from that shown on the slip of gray paper. However, his end was gained, and Mr Gadham left the office in a more cheerful mood than he had entered it.

On returning to his house, he found a telegram awaiting him from Mr Ellitt, requesting his attendance at the office of the latter as soon as possible.

'Something fresh, I suppose!' muttered Mr Gadham. 'I saw him yesterday. What can have happened since then?' He lost no time in obeying the summons.

Mr Ellitt was as prompt in his explanation.

'What I have been a long time expecting, has at last come off!' exclaimed the latter. 'I have had a call from old Seares, the manager of the firm which is against us. He began with a flourish to the effect that he was not empowered to make any offer, was not acting for any one, and all that; but having known the parties to

the suit so long, and being so sorry—disinterested old soul!—to see a fine property wasted in litigation, especially between relations, it had occurred to him that something in the way of a compromise, satisfactory to both parties, might be arrived at. It was possible, he thought, that if he proposed an equal division, his clients might be brought to listen to it.—What did I say? Now, I know old Seares as the hardest, bitterest old fellow in London, who would not lose twopence to save the fortune of any man, woman, or child within ten miles of this place. I know him, and I am sure the game is nearly up, or they would not offer to give away half of the property.—You will not listen to such an offer, I may take that for granted?

‘Do you think it amounts to an offer?’ asked Gadham, who had listened with the deepest attention to the attorney’s narrative. ‘I should like to be sure of that.’

‘Oh, it means an offer, there can be no doubt on that point. But you do not mean to say you will listen to the idea of taking half, when the very offer proves they have no real hope of saving anything?’

‘I do not know,’ said Gadham reflectively. ‘You see, I hate law—no disrespect implied to you, Ellitt—and I am not in the position of a man who has no other resources. If they mean the ready-money half for me, I might discuss the proposal; they might have the business.’

‘Have the business!’ echoed the lawyer. ‘Why, that is a fortune in itself! There is not such another connection in the city of London—so sound, and so easily managed. You would be mad to think of such a sacrifice.’

But mad or not, Ernest did think of such a sacrifice, and made his sentiments so plain, that Ellitt was at last obliged reluctantly to promise to follow up the negotiation.

‘And mind,’ was Gadham’s final instruction, ‘I want this settled. Tell them that prompt measures, handing over quickly, means an easy settlement. Every day of law will make it worse.—Now we leave that matter—and I will ask how long the notice has yet to run?’

This question was understood to refer to the notice at the registrar’s office, which had been given in for the marriage of Mr Ernest Gadham to Miss Dora Ellitt, which it appeared had expired and been renewed.

On the solicitor’s reply, Gadham explained that directly the business was settled—say the day after—he should marry Miss Dora, and so keep his word.

‘I shall go to old David’s,’ he concluded; ‘and come from his place to your private house. We shall not want him many days longer, I hope; and I am sure it will be desirable to keep up the delusion he already labours under; so you are warned.’

The pair smiled at this. If there was not much heart in the smile on either side, yet it served as well as the most genial of its kind.

The day had waned so far, that it was twilight when Mr Gadham reached David’s house. He found the clerk at home, as also Josie and Minnie, and there was a pleasing flutter of excitement in the little mansion. A letter from Geoffrey had been received that day, sent on by the mailboat, which touched at a port where his vessel called.

It said that he had some splendid news, but he meant to save it all till he came home, which would be in a few days after they read these lines; and then, good-bye to the sea! The excitement, and the speculations about these mysterious tidings, can easily be understood.

To Mr Gadham this intelligence was not altogether pleasurable, and while he had tact enough to pretend to rejoice in the news and to refrain from any marked attentions to Miss Josie, he was yet more confidential than ever with David. He confided to him that the suit was about to be settled in his favour; he perhaps strengthened his account of what had taken place somewhat more than the facts justified, and certainly said nothing to indicate that any division would take place; but this pleased David, which was the aim of the narrator.

The result of a long conversation was to leave the old clerk once more in a whirl of confusion. It was clear to him, even in the midst of this whirl, that Mr Gadham only required the slightest encouragement, to make a formal offer, and should he, David, be doing his duty as a father, if he did not exercise his influence to secure such a position for Josie? As for Geoffrey—well, really Geoffrey could not be so unreasonable as to expect anything else, when he came to know the facts.

It was twilight, as we have said, when Mr Gadham arrived at old David’s, and it was dark when he left the house; otherwise, he might have noticed a man under the shade of some trees which stood in a little enclosure on the other side of the way. When Mr Gadham came out, the man drew himself up against the railings, where the overhanging branches made the gloomiest shade, and did not move until he had seen Mr Gadham pass under the light of the most distant lamp-post in the street. Then hurrying across the road, he knocked sharply at Chester’s door, and was answered by the clerk himself.

‘Are you Mr David Chester?’ asked the stranger, and on David answering, continued: ‘Then I want to have five minutes’ talk with you upon business—on rather important business, as you will find.’

‘More business,’ thought David; ‘and with a stranger too!—and my head in such a whirl.—Come in, sir,’ he added aloud; ‘I am at your service.’

The man followed Chester into the little parlour, where David handed him a chair, and then seated himself opposite to him. The stranger was shabby, his coat-cuffs and collar frayed, his boots, as could be seen while he sat with crossed legs, were broken; but worse than this was the evil expression of his grimy face.

‘Well, sir,’ began the clerk, ‘you said you had some business to speak of; will you be good enough to say what it is?’

‘Yes, governor, fast enough, as you will find. But I have been waiting pretty near a couple of hours over the way, to see the coast clear, and it makes me feel almost done up. If you have a mouthful of anything to drink in the house, I should really take it as a favour to have a drop.—I can see you don’t much like my looks, and I don’t wonder at it. But you will find I mean well by you, and you won’t grudge half a glass of something to cheer a fellow.’

A good deal against his inclination, David rose, and produced a bottle of spirits with a wine-glass, which he placed before the stranger.

The latter's idea of 'half a glass' seemed to be the filling the vessel to the brim with neat spirit, which he drank off with great gusto, smacking his lips in approval. 'Thank ye, governor; that was very kind of you, and I shall not forget it.—Now to business. You are in the swim with Ernest Gadham and Tom Ellitt the lawyer, about old Peter Gadham's will. They are as pretty a pair as you could easily find in all London; but I suspect you don't know much about them.'

'I have nothing to do with those gentlemen,' began David; but he was interrupted by his visitor exploding into a coarse laugh, and echoing the word 'gentlemen!' with an expression still coarser.

'I have nothing to do with those gentlemen,' repeated David, with an emphasis intended to be very severe, and calculated to rebuke the offensive tone of his visitor, 'beyond testifying to my having witnessed the will, which you know I am bound to do—it is my duty.'

'Now, look here, David Chester!' said the man, suddenly changing his tone for one of greater earnestness, and unexpectedly bringing his hand down upon that of the clerk, which was resting on the table. 'You are said to be an honest man, and so I think you are; but for an honest man, you are in the queerest business I ever heard of. Now, speak openly, and tell me what share of the property they have promised you?

'Share!' echoed David. 'Why, what right have I to any share? Mr Ernest has been most generous in his intention to befriend me, knowing how long I was with the firm; and I am sure he will help me; but when you talk of a share, why, that is all nonsense.'

'Just as I expected; I'm blessed if it isn't!' exclaimed the man. 'Then you have no agreement or settlement, but are simply trusting to the generosity of Ernest Gadham; backed up, of course, by the generosity of Tom Ellitt? Ha, ha, ha! I have come to-night to alter that, and to put five thousand pounds—not a penny less!'—he struck his clenched fist on the table with a force which made the bottle and glass rattle—'I mean to put five thousand pounds in our pockets. I can't do this without you, because they have the pull on me; for I am a ticket-of-leave man, and the police want me for a lot of things.'

David, who had drawn his chair a little farther from the table and from his visitor, on hearing the avowal made by the latter, stared at the man, unable to guess at what he was driving, and half inclined to think him mad.

'You have sworn to your signature,' pursued the stranger, 'but you have sworn to a lie in doing so.'

'A lie! What do you mean by such an assertion?' cried David. He was angry with the man, and yet there was a dim, half-visible something in his mind which filled him as much with fear as anger.

'Don't get into a passion, governor. You have meant all right, I daresay; but you never signed that will. There wasn't a will—not that Ernest Gadham or Tom Ellitt knew of, anyway; but

there *had* been one, and that was enough for them. The other witness was dead, and so there was only you to deal with; and you will excuse me if I say they did not take you into much account as regards sharpness. They made lots of inquiries about you, and didn't drop down on you so accidental as you fancied. Having got ready, they wanted a man to forge a will. Any lawyer's clerk could do the thing itself; it did not matter what was there, for they well knew you had not read a line of the genuine one; but it was the signatures which puzzled them; so they got me to do it. Yes, mister, they got me, knowing I was the cleverest hand out at such work. There was plenty of samples to be had of your writing, and Sperr-brow's, and the old man's too, so there was no difficulty about that.'

'But I recognised my own writing,' argued David.

'No; you did not; you recognised mine. But better judges than you have been taken in before now in the same way. Well, you see how it is. I daren't come forward; and the swindlers—for they have no principle in them—gave me a pound now and then, just to keep me from starving, or getting so desperate that I should not care what happened. But with you it is different. Do you just go to them, tell them you know all about it; that, as a respectable man with a character to lose, you must have five thousand pounds down, or secured, and you can't take a penny less. Tell them that if they don't do this, you will go to the police and blue the whole lay. As a respectable man, you can do this, and you ought to.'

'How can I say these things, or believe a word you tell me?' asked the bewildered David, 'when I have actually signed the will, and have recently sworn to my signature, which, I repeat, I am certain is genuine. I shall keep to that belief.'

'No; you won't,' said the man, with a cunning grin, which made him appear even uglier and more repellent than before. 'I have been a little too clever for them, with all their sharpness. I thought they might try to best me, so I was first with them.—Did you see the date of this new will, or was it mentioned in your affidavit?'

'It was mentioned; and I remember it very well; it was the 20th of May.'

'I put in the 20th.—Now, where were you on the 20th of May in that year?'

'I—I don't know, except that I must have been at the office, or I could not have signed the will.'

'I thought you would say so. I knew you had nothing else to go by,' continued the stranger. 'Now, I will tell you better. Do you recollect going down to Liverpool with old Gadham's lawyer, you taking down some papers and books, to prove a charge against Andrew Whitman, alias Andrew Long, alias Fly Scotty, alias fifty other things?'

'Yes, of course I do! But when we got there'—

'You wasn't wanted,' interposed the man. 'There was charges enough against him without yours. That was the 20th of May, as you can easily prove, and as I know, for it was just before the Derby, which I had made up my mind to see run; and I am Andrew Whitman.'

'You!' cried David.

'I got five years that time, so I ought to remember when it was. I saw my way to having a pull on them two by putting in a date when you could not possibly have been in the office. So, you see, we have got them beautiful; and you as a respectable man can stick it into them to what figure you like.—Now, what do you think of it, governor?' I should say: "Lose no time; go to work at once." I should be at them to-morrow. Don't you agree with me?'

'I cannot talk to you to-night; you had better go,' gasped David.

'I see; you want a little time to think, I suppose.—Here is an address,' handing a piece of paper to his host. 'I can be heard of there, or a letter will find me. If I don't hear in three days, I shall look you up again. So good-night, governor. You will find me right as the day, square and sound; and don't forget my tip. Five thousand is the very lowest you ought to ask. Ride the high-horse; they must knuckle under. Good-night, governor, and good-luck.' With this the stranger left the house.

#### A DESTRUCTIVE FLY.

It is only within the last few months that attention has been drawn to the great loss caused to farmers, breeders, and graziers by the depredations of the Warble Fly. It is mainly due to Miss Ormerod, the Honorary Entomologist to the Royal Agricultural Society of England—from whose Report on the subject we derive the facts for this article—that attention has been called to the matter at all. When we state that the annual loss is estimated at between six and seven millions sterling, many will no doubt think it is very much exaggerated; but if they will procure a copy of the Report and carefully study the figures, they will, we think, come to the conclusion that the amount is rather under than over estimated. The fly in appearance is not unlike the common humble-bee, and is about half an inch in length. The female is provided with an egg-laying tube (ovipositor); but it is a moot-point whether she really deposits her eggs on the hide, or, by means of her ovipositor, pierces the skin and leaves the eggs underneath. From the mad way in which the cattle gallop about when the fly makes its appearance, we are inclined to think she adopts the latter mode. Egg-laying generally takes place during May, June, and even July; but is slightly varied by the weather, or by the cattle being on high or low pastures. The egg is oval-shaped, of a white colour, with a small brownish lump at one end. Having safely deposited its eggs, the fly's mission is finished. In a few days the egg brings forth a small maggot, which at once commences eating its way through the hide to feed on the juices beneath. About Christmas, lumps—small at first, but gradually increasing in size until they attain that of a walnut—will be seen on the backs of the cattle. These lumps are caused by the growth of the maggot, which, when full grown, is about an inch in length, and the thickness of the tip of one's little finger. Strange to say, by many farmers these lumps—called warble-lumps—were considered as showing that

the animal was in good condition, and were called 'health-lumps' or 'thriving-lumps.'

It is curious to note that the maggot, or 'bot,' lies head downwards, feeding on the sore under the tissues of the hide, while with its black-tipped tail—often mistaken for its head—it is drawing in breath from an opening in the 'warble.' When the maggot is ready to turn into its chrysalis stage, it presses itself out of the opening tail foremost, and falls to the ground, where it finds shelter under a clod or stone. This, in a few words, is the history of the ox warble fly.

Now, let us turn to the injury it does in its brief career. We have already said that the appearance of these flies causes the cattle to gallop madly about as if for their very lives. It is, we suppose, known to every one that feeding-cattle cannot grow in flesh without rest and quiet; and milch cows suffer doubtless to a greater extent than most people are aware of. To irritate or excite a cow reduces both the quantity and quality of the milk; so, when a cow gallops in mad terror several miles a day, the loss must indeed be something considerable. Then, again, just fancy the agony these poor animals must suffer when these huge maggots are feeding upon them, many even dying in consequence. When the hides have been taken from young cattle which have so perished, the back has been found to be one mass of sores, the discoloured blood and matter showing how intense the inflammation has been. 'This leads to the important point,' says Mr D. Byrd, 'what is our loss in the cheese-tub caused by the warble and gad flies?' The delay caused in the growth of the cattle from these tormenting flies and the presence of the maggot is estimated at a loss of two pounds per head. 'In the dairy cows,' the Report goes on to say, 'the loss will be greater. The daily loss of milk may make a difference of one hundredweight or three-quarters of a hundredweight of cheese per cow per annum. Half a hundredweight, or twelve and a half per cent. of milk less in a dairy making four hundredweight, at seventy shillings, comes to thirty-five shillings. But twelve and a half per cent. is too low an estimate; it may in some cases be put at three pounds per head; and in a dairy of one hundred cows would show a loss of three hundred pounds.' These figures, we think, are instructive, and deserve to be carefully studied by every dairy-farmer.

Now, let us see what damage it does to the hide. Here the loss passes in a degree from the farmer to the butcher. We have seen how the warble-lump is in every case perforated, which means, that for every warble-lump there is a corresponding hole in the hide. As these lumps range in number from ten to one hundred, a hide that has fifty or sixty holes in it becomes practically worthless, or, at any rate, the value of it is enormously depreciated. In some districts, any hide that shows more than half-a-dozen warbles is considered a badly warbled hide, and fetches a correspondingly bad price. To give some idea of the amount of loss, it may be noted, that a deduction of three farthings per pound on a hide of ninety-five pounds-weight means a loss of about six shillings on the hide. As a matter of fact, the loss on hides is often ten to fifteen shillings a-piece.

We stated at the beginning of this paper that the annual loss is between six and seven millions sterling, and we think, taking all things into consideration, this is no exaggeration.

It is somewhat cheering to see that this enormous waste—for waste it is—can be easily and cheaply done away with. When the maggot is in the warble, it is entirely at the mercy of the farmer. It cannot get out of the warble until it is ripe for the chrysalis stage; and before this stage has been reached, every maggot should have ceased to exist. The question naturally arises—How? We answer—in a variety of ways. It may be squeezed out by the fingers; it may be stabbed with a needle; it may be poisoned; and last, and perhaps the most effective way of all, it may be suffocated. Squeezing them out would be a tedious affair; stabbing them, uncertain; poisoning them, dangerous, for it would be easy to poison the animal as well. Mercurial ointment was first recommended to be placed on the opening of the warble in a small quantity; but mercurial ointment in unskilful hands has already proved dangerous. Applications of tar, cart-grease, sulphur, &c. are also efficient, but in a lesser degree. Carbolic acid is also recommended; but, from what we know of this acid in its raw state, we should fear it doing as much injury to the animal as to the maggot.

Messrs M'Dougall's Cattle-dressing and Sheep-dip, which is non-poisonous, has proved very effective for the destruction of these maggots. A small application of this Dressing to the opening in the swelling has the effect of coagulating the maggot and causing its entire disappearance. What becomes of the maggot, one cannot say.

It is curious to note that human beings have also been attacked by this fly, its eggs deposited, and the usual symptoms followed, so far, at least, that five or six of the maggots were squeezed out from the throat, varying in size from one-half to three-quarters of an inch.

### THREE LINKS IN A CHAIN.

NEITHER the brush nor the pen, but the lancet and the scalpel are properly my tools, and yet for an hour past I have been occupied in delineating on the canvas of memory certain scenes that belong to the past. The reverie-painted pictures are three in number, and each is vivid, sharply defined, and stands conspicuously out in its setting of trivial or exciting circumstance. Have they anything in common, despite their seeming dissociation? I begin to think so. A more dubious problem: If there is indeed a hidden secret link between these events, will the discovery thereof aid or hinder the realisation of my dearest hope? I have at present no answer to this question.

The first scene imagination has conjured anew before me with all the exactness of realism reveals the interior of a jeweller's shop in Renford, my native town. It is a fine large business apartment, with its walls lined with cases displaying through their polished glass costly articles of vertu—for Mr Huntley magnifies his trade, and is a collector—and its counters spread with more cases, holding in dainty nests gold and silver and precious stones, fashioned in many forms of use

and ornament. Mr Huntley's shopman is busy in the front rearranging a portion of the stock; his employer and I are discussing in the office, semi-partitioned off at the rear, a question of local politics having no sort of connection with the present narrative. My father is vicar of Renford; and Mr Huntley, as long as I can recollect, has been vicar's churchwarden—hence the intimacy between us; and although I have commenced the study of medicine, and look speedily to sever the tie of residence in the quiet western town, I am still interested in local affairs. Suddenly, the shop doors—there are wisely two—open one after the other—the inner one with a sharp little jerk that betokens nervousness or haste on the part of the prospective customer. The austere young man who is polishing an enamel brooch deftly replaces it, slides back the case bottom with a subdued click, and waits in an attitude of deferential attention. Standing at right angles to Mr Huntley's desk, I am facing the shop and the street, and however incurious, am compelled to see and hear what passes.

It is a young girl—she may be fifteen, she may be older—who has entered, and there is something about her that I find curiously attractive. She is a stranger to me, and therefore, perhaps, I observe more particularly the slim shapely figure, fawn-like in its timid yet graceful movements; the pretty piquant profile; the clear complexion, with the pink spot, telling of excitement, in the centre of the beautifully moulded cheek; the wayward golden curls, that defy the restraint of the simple sun-hat; and the dress of soft creamy white, which so admirably suits both its owner and the pleasant summer weather. Erect, energetic, with an evident sense of humiliation playing the foil to a touch of unconscious hauteur—the vision comes back as I write.

'You wish to see the principal, miss? Did I understand correctly?'

The girl gives a quick gesture of assent; the assistant calls his master, and I am left with only the occupation of the onlooker.

From a small threadbare reticule I see produced a bracelet, a ring, and one or two other articles, which seem to have formed part of a fashionable lady's outfit of jewelry. The colour has deepened on the maiden's face, and I am fancying that she is at once proud of her possessions and anxious as to the result of her present enterprise. She has reason for her anxiety, of which it is charitable to believe she suspects nothing. I will be bold to say that one cannot watch the changing lights and shadows of her countenance and think her the originator or wilful accomplice of fraud.

'These—what can you give me for these?' she asks in a low quivering voice. 'You do buy gems, I believe; these are very valuable, I am told.' She does not appear to have the smallest appreciation of the fact that a respectable tradesman will hardly make a random offer for jewels that can be thus described, without inquiry not only as to the *bona fides* of the applicant, but as to the authority also for the sale.

But this stage is never reached. Mr Huntley has taken up one by one the gleaming wares, and one by one laid them aside after an inspection which has its result in making him phenomenally grave and chasing a storm-line across

his forehead. 'Have you any idea of the worth of these articles, or of either—any one of them?' he dryly asks.

I think both the assistant and myself instinctively pick up our ears. The girl, too, is startled by his tone. 'I have been assured—papa said it—that the stones in the bracelet alone cost two hundred and fifty pounds.'

The glance with which she meets Mr Huntley's keen look is as open as the day, and the expression on the jeweller's face turns to one of pity. 'I could not give you as many shillings, miss. The stones are clever imitations, and that is all. There is not one genuine amongst those you have shown me.—Mr Skirrow, let me have your opinion.'

The assistant confirms the unflattering judgment, and does it with a sneer that I felt disposed, though with no valid reason, to resent.

The crimson tide has ebbed, and the girl's cheeks are blanched; her lips quiver, and at first no sound comes from them; her eyes slowly fill with tears. I fear that she may drop in a swoon, but this woman's weakness she does not seem to share. There are seconds of intolerable suspense for us all. At last there is a half-stifled cry: 'Jack! how could you!'

It is plain that she accepts the situation, and that her thoughts are even now busy with the solution of her dark enigma. For the moment she has forgotten her environment, and she murmurs her vain protest against the—to us—unknown culprit whose duplicity, however exercised, has plunged her into an abyss of shame. Then she stammers an apology, accepts mechanically at Mr Huntley's hands the shabby bag into which he has gathered, by her permission, the dishonoured treasures, and retires. I question if in all Renford there is a heavier heart; and I wonder, with eager palpitating interest, who is 'Jack,' and what is the precise nature of the nefarious trick he has perpetrated.

Mr Huntley can explain little—only that Miss Raine and her father (who is said to be an artist) are the new people at Bristol Cottage.

The second of these pictures, imprinted so indelibly on the retina of my mind, is widely different in *motif* and in detail. The place is an ambulance tent, pitched, literally enough, as some of us think, in the wilderness. The Egyptian troubles that began with the riots and rebellion at Alexandria have culminated in the Soudan War. Gordon—bravest of the brave—has reached Khartoum. El Teb has been fought, and our troops are on their way back from Tokar to Trinkitat. I am with them in the capacity of army surgeon, and there are times when I satirise bitterly the longing for adventure and idle dreams of distinction to which I am indebted for the appointment I hold. But self-reproaches are useless. The tent is tenanted by four men, three of whom have been wounded in a surprise skirmish—a mere outpost affair; the other is the victim of a camp accident. The most serious case is that of a private called Eastleigh. He has been badly dealt with by a dying Arab spearman, has lost much blood, and himself believes that his last hour is near. I have done for him what is possible, have attended to the needs of his companions in misfortune, and have

lingered by Eastleigh's side to test yet again the security and sufficiency of his bandages. What it is in the poor fellow's face that strikes me with a sense of familiarity, or at least of previous acquaintance, I cannot guess. But even in these dubious half-lights, I am persuaded that some reminiscence should answer to the impression thus created. Only—it fails to do so.

'Doctor!' Eastleigh faintly moans.

'Well, my lad?' I respond.

'Tell me plainly. Have I a chance?'

'I decidedly hope so,' I reply evasively.

'And hope isn't expectation,' he says, with a curious smile.

I am silent. I dare not equivocate in such a case as this; and I recognise, too, that though but a private soldier, Eastleigh is a man of education, and quick to seize the meaning of accents as well as of words.

'I take it, you and I form the same opinion, doctor,' he says, between two terrible paroxysms of pain; 'and the world won't lose much if I do go; but—but—I wish you'd do me a favour. I can depend on you?'

'Anything that is in my power, Eastleigh.'

'I've a father living in England, and he and I quarrelled. I was to blame. I was a sad scape-grace. But he thinks to this day I robbed him. I didn't; it was my cousin Dick. Find him, and tell him that. The address!—'

But the exertion is too much; the patient relapses into unconsciousness, and is restored with difficulty. I forbid further talk.

'I quite understand what it is that you wish of me, and I will do as you request,' I say. 'The address I shall find, if I require it, with your kit. I hope it will be unnecessary for me to search, and that you'll live to explain to your father face to face.—Now, silence! Dickson will watch, and send for me if wanted.' And I go out into the darkness of the plain, and muse over a solitary cigar until joined by a couple of regimental comrades. I cannot forget the face of the wounded soldier.

In describing the third of these mental pictures, I must explain that I am now no longer half a civilian and half a soldier. Military stations and barrack hospitals know me no more. A slender inheritance has come to me from a dear old maiden aunt, the cheer of whose gentle encouragements I would to this day rather have had than her money, and with it I have bought a partnership with an ancient college friend of my father's. Dr Hildreth has treated me generously, for the sake of auld langsyne; he and his wife—they have no children—are delightful people; and Great Gamble is a quaint, healthy, well-behaved East Anglian town, with many another humorous incongruity about it beside that of its name. Existence here is humdrum—granted. But I am content—more than content, since I have been honoured with the friendship of Mrs Bristowe. Margaret—she is Mrs Hildreth's kinswoman, many degrees removed, and thus I have learned the name—is a widow, and I had heard her sad and romantic story before I met her. Her husband bore that title scarce an hour; he fell in a fit at the bride's feet as he was leaving the church door, and was a dead man before succour could arrive.

The medical evidence showed that he was the victim of heart-disease, to which the excitement of the day and the hour had administered a fatal impetus. So grievous a shock would abundantly account for the gravity which seems a marked feature of Mrs Bristowe's character. Not that she is gloomy; her age forbids that, for she is young still—not five-and-twenty, Mrs Hildreth says—and youth has a recuperative power which will struggle back to the sunshine, however crushed by sorrow. Yet there is a seriousness in her mirth. At least I think so, and it suits well with her stately beauty.

The current of an emotion which I recognise as love hurries me on. Will Mrs Bristowe consent to be my wife? I propose to put the question to the test this very evening. It may be that I shall end the present narrative with Margaret's reply.

Now for my third reverie picture. The scene is a metropolitan railway station. The place is thronged with very various sorts and conditions of men, for detachments of the brave fellows who marched to relieve Gordon—and alas! marched in vain—are arriving, and the London crowd is there to welcome them. I am ten minutes early for the train I wish to catch, and the departure platform seems almost deserted, by comparison with the stir and bustle elsewhere. I stand idly by, and watch a body of the bronzed heroes file past on the opposite side of the narrow cutting. Those round me set up a cheer, in which I hesitate to join; for do I not belong to those who are the subjects of the ovation? Their dangers and privations I have shared. I am not quite alone in my silence. There is at my left hand an old man, who stands rigid as a statue, but with eyes blazing with a strange, fiery eagerness, as the men gather into military order and tramp away through the station gates in the track of their earlier comrades; and hanging upon his arm is a woman in black, closely veiled.

'Perhaps it was a mistake, and it was some one like John at a little distance, but not John himself,' says the father, as I instantly elect to believe him. The tones have in them such a depth of sadness and vain regret, that I unconsciously fall to studying the speaker's face. It is a striking and a noble one, though there are signs that both pride and passion have done work thereupon with their ruthless graving tools. As I watch, there comes to me the conviction that these lineaments are not wholly strange; yet I am baffled to discover any basis for the curious fancy of familiarity.

His companion murmurs something which the shriek of a whistle causes me to lose (as if I had the remotest right to play the eavesdropper).

'Ah, John! Can he not trust me to forgive him everything?' the old man answers.

'This is your train, sir.—Any luggage?'

I saunter leisurely off in the rear of the porter I have tipped, and the episode—scarce worthy of such a designation—is at an end. But that fragment of conversation comes back at this hour as if it were even now ringing in my ears, and I am trying to account for the enduring nature of these recollections as I weave them together.

I paused at the preceding paragraph three

hours ago, and took my hat and overcoat—for it is a stormy October night—and went to Mostyn, as the Hildreths' home is called. Mrs Bristowe's visit draws to a close. She has a father staying with friends in a southern cathedral city, and she has but fulfilled an old promise by thus invading the Fen country. Parent and daughter return simultaneously, or as nearly as they can contrive it, to their London residence. Further delay on my part might have been disastrous. By which hint I have perhaps revealed that I do not now write as a disappointed man. Yet there was hazard and uncertainty.

Mrs Hildreth had more than a suspicion of my errand, and contrived, with womanly dexterity, to leave Margaret and me to a *tête-à-tête*, a service for which I shall ever owe my partner's wife a debt of gratitude. Hildreth was attending old Sir Lucas Gannithorne at Gamble Manor for gout. I had counted upon this; though, had he been at home, my friend and colleague, I make no doubt, would have caught a peculiar twinkle in his wife's eyes—or have practised the art of divination for himself—and have remembered a neglected call.

I am not going to enter into details. Let it suffice that I offered my hand to Mrs Bristowe—my heart was hers already—and was refused. But she admitted that to some extent she reciprocated my feelings of regard and affection; whereupon I plucked up courage to inquire into the reasons of her decision.

During the course of the conversation that ensued between us, it was borne in upon me more and more that Margaret was the girl who had suffered so crushing a discomfiture in the jeweller's shop at Renford. I was determined in some way to have this question resolved before wishing her farewell. But she forestalled my purpose.

'Our acquaintance has been agreeable to me also, I confess,' she said. 'Have you any idea, Mr Bruton, that it was not in this room that we met—or rather were thrown into accidental proximity for the first or the second time?'

I started at these last words. Was Margaret the veiled lady of the railway platform? 'I must acknowledge that I am prepared to hear it,' I answered. Our eyes met, and there was the bond henceforth of a mutual understanding between us. But how full of hopeless pain was Margaret's glance! And then, bit by bit, she confided to me the story, which, in her view, constituted an insurmountable obstacle in the path of my happiness. She had a prodigal brother, who had only escaped condign punishment for his misdemeanours by opportune disappearance. The burden of vicarious shame lay heavy on her soul, and she most resolutely purposed to bear the load alone.

'We know nothing of Jack's whereabouts or mode of life now,' she said; 'and it is my daily dread that some new disgrace may yet come upon us. I will not expose another to this irksome risk.'

My temerity surely transgressed the bounds of courtesy. 'But you married Mr Bristowe?' I said.

The delicate oval features were mantled with a vivid blush, and I construed the sign as chiefly one of anger. It had a very different and, for me, a less awkward explanation.

'Poor Dick! I will not say one harsh word of him,' she murmured. 'But—I did not—girl as I was—care for Dick as a woman ought to care for the man she marries. He was my father's choice for me; and he had a knowledge of my brother's escapades, which we wished buried in silence.'

'And you were the sacrifice.'

There was no denial. 'If Jack would come home and reform, father would forgive him even the affair of the jewels. You saw me try to sell the sham ones, wickedly and cleverly put in the place of the real gems,' Margaret murmured. 'It was a cruel trick, for money was wanted then. Father was ill, and there were Jack's other defalcations to make up.—I thought I saw my brother once in uniform, as a common soldier; but probably I was mistaken. It was at a railway station.'

'And I was there too?'

'Yes.'

It was the opportunity for giving an account of private Eastleigh and of his request; and in a voice consciously vibrating with excitement, I unburdened myself of the recollection. All the colour fled from my love's face.

'Dick the guilty one! And we both were blinded!'

'But, Mrs Bristowe, can you be certain of this soldier's identity?'

'I think so,' Margaret answered. 'Eastleigh was my mother's maiden name; it was natural for Jack to assume that. But, oh, tell me—what became of him?'

Suspense approaching agony was in the tones. Jack Raine was loved still in spite of his faults. I hastened to relieve the tension.

'He was much better the next morning, and I believe recovered,' I said. 'But he was not properly in my charge. I had duties elsewhere; and I have not seen him since. But it is nearly a certainty that you saw him on the occasion you have mentioned. If I find him for you, and there is a reconciliation, and Jack makes good his statement of innocence, of which I have no doubt—will you then grant me my desire, Margaret?'

Sweetest of monosyllables was my girl's low 'Yes.'

Postscript, a year after, by Mrs Margaret Bruton: 'Amongst some old papers that Frank has brought from his den in Great Gamble High Street to our nest, so prettily named Woodbine Villa, there was the above. Frank says that as far as he is concerned it is a complete and veracious history, ending, as he had suggested it might, with my reply to a certain question. Veracious it may be, but complete it certainly is not. But he is obstinate, and refuses to add a single line of sequel. There is a spare half-page, however, and I am toiling to make good Frank's indolent neglect.'

'Private Eastleigh was indeed my long-lost brother. Frank had very little difficulty in finding him, knowing so well in what quarter to apply. Jack was ignorant of my first marriage and of his cousin Dick's death. It seemed that pride and a mistaken notion that my father's resentment was implacable, kept him from communicating with us. He has now made it very

clear that he was rather sinned against than sinning, though he was too noble to accuse Dick at the time. It was unnecessary to purchase his discharge, as his time of service was nearly expired, and he has now settled down in a mercantile appointment, sobered and repentant of his past follies. And this, and more, much more, we owe to my self-willed, provoking, noble-hearted husband.'

## THE ELECTRIC LIGHTING OF MINES.

### A SUCCESSFUL METHOD.

THE desirability of illuminating mines has long been felt, and scientists have given much attention to the subject; but the difficulties which presented themselves have hitherto proved insurmountable, and nothing practical has therefore resulted from the various suggestions and experiments which have been made. To enable the collier to follow his daily task, he is provided with a safety-lamp; but to light up the main roadways of a mine with a number of these lamps would not only increase the working expenses of a pit, by the additional labour which would be necessary to keep them properly cleaned and trimmed, but such a system would also augment the chances of an explosion. When the Davy lamp was introduced, the ventilation current in mines did not exceed a velocity of five or six feet per second, and in this the lamp was practically safe; but within recent years, great improvements have been effected in this respect, and the current now moves at four times that rate, the result being that, in the presence of coal-dust or firedamp, the lamp ceases to afford security to the miner, inasmuch as there is always the danger that the swiftness of the ventilating current may drive a point of flame outside the gauze, when, of course, the lamp would practically become a naked light, and all the disasters attending an explosion would ensue. Besides this, in case a mine were illuminated by safety-lamps, there would have to be faced the risk of their being accidentally knocked down and broken, and so a catastrophe occurring in that way; whilst there would be the further drawback, that to light up an extensive mine, some thousands of them would be required, as the flame of each would only be about a half-candle power. It is, therefore, clearly impossible that such a system could ever be adopted.

Some time ago, electricity was proposed as a light-giving agent in mines, and within late years attempts have been made to introduce it as such, but without much success; for, although it was found quite possible to illuminate the bottom of a pit and the adjacent roadways, yet, when a system of conductors and lamps was extended into the workings, some serious difficulties were presented. Consequently, darkness has hitherto remained a characteristic of the mine; and toilers in the bowels of the earth have continued to lose their lives to the number of something like four hundred and sixty a year by the roof or sides of their working-places falling upon them, their

safety-lamps not giving a sufficiently good light to enable them to see defects and protect themselves against accident from them. Almost a like number of deaths takes place among miners every year from miscellaneous causes (exclusive of explosions), and no doubt many of these are due to deficiency of light. Such a death-roll is indeed awful to contemplate; and the fact that there is every probability of its being lessened will be hailed with gladness not only by the mining community but by the general public.

As has been already pointed out, electricity has been looked to, to solve the question; and although the first attempts did not satisfactorily accomplish what was desired, it is by means of this agent that it has at last become possible to illuminate mines, the inventor of the system being Mr Miles Settle, managing director of the Madeley Coal and Iron Company, North Staffordshire, who is also patentee of the 'water-cartridge' for blasting with perfect safety in the most fiery mines (see *Chambers's Journal*, March 6, 1886). One of the great difficulties which had to be overcome in electrically lighting a mine was the fact that, after the glass vessel containing an incandescent light had been broken, the film still remained at a white-heat, and would therefore ignite any inflammable gas which might happen to be near. This obstacle Mr Settle has surmounted; and his invention is of very simple construction. A small incandescent lamp is fixed in an air-tight glass globe, and this is placed in a larger vessel of the same pattern. By filling the outer glass with water, the air-tight globe and the lamp it contains are caused to float to a point where connection with the electric current is established. If the outer vessel be made air-tight as well as the inner, precisely the same result is obtained by blowing into it through a tube to which a cock is attached. Should any portion of the lamp get broken, the connection is at once severed, and the light instantly goes out. This system of illumination has now for several months been in successful operation in one of the mines under Mr Settle's charge. In this pit the electrical power is derived from a Gramme dynamo-machine, which is fixed in a passage in the main airway of the down-cast shaft at a distance of three hundred yards from the surface. From this the wires conveying the current run to the working-face of the coal—a distance of about four hundred yards; and, to prevent accident, they are incased in wood. At distances of thirty yards, a lamp is placed, and the light it affords—equal to sixteen sperm candles—is sufficiently brilliant to dispel the darkness and to enable the miner to see the nature of his surroundings.

Of course, the great question which has to be considered in connection with a lamp of this kind is, is it perfectly safe under all conditions? After the crucial tests to which Mr Settle's invention has been submitted, there can be but one reply—Yes. A current of explosive gas has been directed upon it for a period of twenty-four hours without producing any effect, and a lamp has been broken in a chamber charged with an inflammable atmosphere without the latter being ignited.

It would therefore appear that, so far as human agency can avert disaster, brighter days are in store for the mining population, for, with electricity to light the pit and to blast the coal, the

terrible annual death-roll must be greatly lessened. Those who live in colliery districts will feel that by Mr Settle's invention a great step has been gained, and they will hail with delight a contrivance which promises to decrease the risks of those who toil in the bowels of the earth, and who literally carry their lives in their hands, and which will tend to do away with those harrowing spectacles which ever attend an explosion—headless trunks, horribly charred corpses, broken-hearted widows, and weeping orphans.

#### A SPIRIT-GUARDIAN.

I THINK that through the dismal night  
A Spirit robed in purest white  
Is walking, veiled from mortal sight :

A figure which I cannot see,  
And yet its hand all tenderly  
Is in my own, and leadeth me.

I cannot see it, yet I know  
The Spirit by my side ; and lo,  
Its light is with me as I go !

An inward light of love and peace  
That follows me, and will not cease,  
But strengthens with a fond increase :

A light that sometimes, when my fears  
Are blinding me with mist and tears,  
Like an unclouded east appears.

And though I stray in lands unknown,  
That Spirit-hand within my own  
Will never let me feel alone.

For, when the way is dark and long,  
And spectre-forms around me throng,  
To still my laugh and hush my song—

When through a weary desert land  
I falter, and can scarcely stand,  
I feel the comfort of that hand.

What though there spreads a mist to hide  
The figure walking at my side,  
The gulf is neither deep nor wide ;

But when at last my journey done,  
Shall bring the setting of the sun,  
And end of labours now begun,

I think the close of life will be  
A sundered veil, when I may see  
The Spirit-Guardian leading me.

## HOW A NEW WORLD WAS FOUND AND LOST.

IF, in any average assembly, the question was asked, 'Who discovered America?' probably the great majority would unhesitatingly reply, 'Christopher Columbus.' Nevertheless, the opinion of the majority would hardly be correct; Columbus did not discover the New World—he merely *recovered* it. At the time the bold Genoese planned his scheme of reaching the Indies by a westward route, documents were in existence giving particulars of several visits to the North American continent five hundred years before. Whether Columbus knew of these voyages is a point which never can be determined; but, judging from the course he steered and the object of the expedition—to reach the East Indies, the *El Dorado* of the Middle Ages—it seems very unlikely he had derived any information whatever from this source.

All honour is due to the man who first resolved to penetrate the unknown secrets of the West by boldly steering his barque for the regions of the setting sun, and who carried his attempt to a triumphant termination despite of his many difficulties and discouragements. Still, the fact remains that Columbus only regained a world well known to Europeans five centuries before his day, a world with which a continuous intercourse was maintained for upwards of three hundred years, and which was then inexplicably abandoned, and its very existence ignored or forgotten for well-nigh a couple of centuries. How and when the North American continent was discovered, previously to its re-discovery by Columbus, it is the purpose of this paper to relate.

When the Roman galleys circumnavigated Britain, the farthest land they descried to the north was named by them *Ultima Thule*—the end of the world. This has been supposed by some authorities to have been Iceland, by others the Shetland Islands; but it was not until the year 874 A.D. that any settlement was made in Iceland. It seems to have been first visited by

Naddoir, a Norse pirate, who was driven thither by a storm in the year 860; and Gardar, a Swedish mariner, sailed round it in 864.

Not long after the colonisation of Iceland, Greenland was reached, and in the year 986, Eric the Red founded a settlement there, named *Eric'sfiord*, after himself. One of his companions was an Icelander named *Bardson*, who had a son, *Biron*, then absent in Norway. On the latter's return to Iceland, he, finding his father had gone to Greenland, at once resolved to follow him. Contrary winds drove him far out of his proper course, and for many days his ship was enveloped in dismal fogs, so that he lost all reckoning as to his whereabouts. At last the fogs cleared away, and he perceived land a short distance off. The nature of the coast, however, not corresponding with the description he had got of Greenland, *Biron* concluded he was not on the right track, and steered his ship to the northward. Two days afterwards, land was again sighted; but being flat and covered with trees, it was evidently not the land they sought, and was accordingly left to windward. Still sailing on before a south-west breeze, in three days' time they came to a mountainous island covered with ice. This also was passed without landing; and in four days more, the coast of Greenland was sighted, and *Biron* had the satisfaction of rejoining his father. To *Biron*, therefore, belongs the honour of being the first European to discover the shores of North America. There is no reason to doubt the truthfulness of the accounts of this voyage; and it is evident, from the duration of the trip and the description of the lands sighted, that the ship, after departing from Iceland, was carried far to the southward until the coast of America was reached. No landing was made on the continent, and *Biron* contented himself with making all possible speed to his destination, coasting along the shores of Newfoundland and Labrador on his way thither.

Several years after this, *Biron* was again in Norway, and gave Earl Eric an account of his voyage and of the new lands he had discovered.

The hardy Norsemen at this time were the most daring of mariners, and the earl desired that more should be learned about this strange and hitherto unknown country. Accordingly, on Biron's return to Iceland, it was determined to make a voyage of further exploration. Leif, a son of Eric the Red, took the command of the expedition; and in the year 1000 he sailed with a crew of twenty-five men. In four days' time they came to the last land discovered by Biron, which they named Hellaland, from the shores being composed of slate, *hella* being the Scandinavian word for that substance. What part of America this was, is disputed, some authorities maintaining it to be Newfoundland; but, from the description of the land, it is more likely to have been Labrador. Leaving here, they stood to the southward, and came to a land covered with woods, probably Newfoundland or Nova Scotia. This they christened Woodland; and, still running before a north-east wind, in two days more they again sighted land. Here they sailed between an island and a promontory running north-east, and casting anchor, went on shore. Discovering a large river issuing from a lake, they brought their vessel into it, and resolved to winter there and explore the neighbouring country. Huts were accordingly erected, and the settlement received the name of Leifsbuthir. A German named Tyrker was one of the party; and having reported that, in one of the exploring expeditions, he had come across great abundance of wild grapes, the country was called Vinland. The whereabouts of this settlement—the first on the American coast—is of course a matter of conjecture; but, judging from the description of the climate and products of the soil, it is probable it was somewhere on the coast of Massachusetts or Rhode Island.

In the spring, Leif returned to Iceland; and the accounts of his discoveries had the result of stimulating others to prosecute the work of exploration. Another expedition sailed in the year 1004, under the care of Thorwald, who seems to have profited by his predecessor's experiences, and steered a more direct course for the American coast. Coming to a peculiarly shaped headland, opposite to another with a fine bay between, he named it Keel Cape. This is supposed to have been Cape Cod. Doubling this, Thorwald continued his course until he arrived at a fine promontory, beautifully wooded, which so charmed him that he resolved to found a settlement there. On landing, they found three canoes, under each of which were three Indians, or Skraelings as they called them, the latter being their name for the Eskimos. This was the first meeting of Europeans and the aboriginal inhabitants of North America, and its result was a foretaste of the many bloody encounters destined to occur in after-years between the settler and the savage. The natives seemingly were in nowise alarmed at the advent of the white strangers, and stood their ground manfully. In the fight which ensued, however, the superiority of the white man was soon apparent, and eight out of the nine were slain. The other managed to effect his escape, and soon returned with a considerable company of his tribe. Thorwald and his men were compelled to retreat to their ship; but, unfortunately, the commander of the expedition himself received a mortal wound

in the fight. An arrow pierced him under the right arm, and he soon became aware that his end was nigh. His last words were instructions to bury him on the promontory he had thought so fair, and then make their way home as speedily as they conveniently could. After carrying out their leader's instructions as to his burial, the party sailed to Leifsbuthir, where they passed the winter, and in the following spring returned to Greenland.

The next voyage was a complete failure. Thornstein, third son of Eric the Red, embarked along with his wife; but after being driven about by tempestuous winds all summer, they quite lost their reckoning. The winter season was already come when they succeeded in reaching the western coast of Greenland, where they were obliged to remain. Here Thornstein died; and in the following spring his widow brought the ship back to Ericsfiord. The object of this expedition was to recover the body of Thorwald and bring it home to Greenland; but instead of succeeding in his purpose, poor Thornstein found a grave himself far from his home and kindred.

In the summer of the following year (1006) a much more important expedition was fitted out for the further investigation of the new continent. The expedition was under the command of Thorfinn, surnamed the Hopeful. He was a man of wealth, and was descended from illustrious ancestors, some being of royal rank. However, if the old manuscripts are correct, his blood must have been anything but pure, as among the more worthy of his 'forebears' are said to have been Danish, Norwegian, Swedish, Scottish, and Irish persons of high and powerful station! When the festival of Yule arrived, the customary festivities were observed in true Scandinavian fashion. Thorfinn was captivated by the charms of Gudrida—Thornstein's widow—and she, having evidently forgot her sorrows, became his wife before the expedition sailed. It consisted of three ships and one hundred and forty men. An attempt was to be made to found a permanent colony, and all sorts of necessaries were taken on board ship, including live-stock and domestic animals of every description. At last, everything was in readiness, and the expedition set sail. Hellaland was first touched at, then Woodland, where abundance of wild animals were met with. At these places, however, they did not delay, but pressed southwards to more favoured lands. Keel Cape was sighted and passed, after which they coasted along a great tract of sandy beach till they came to where a fiord or firth ran a great way inland. At the mouth of the firth was an island, and both here and farther up the estuary strong currents were encountered, which considerably retarded their progress. The island they called Straumey, or Stream-island; and the firth, Straum-fird. The island is conjectured to have been that now known as Martha's Vineyard; and the firth would probably be Buzzard Bay. Here they remained for some time, exploring the country round about, and found it to be of a very fine description. To men accustomed to the bleak shores and unkindly climate of Greenland and Iceland, the magnificent summer climate and luxuriant vegetation of this southerly latitude must have been charming in the extreme.

One of the captains, Thorhall by name, was

despatched with the smallest ship to look for the settlement of Leif, in Vinland; but a most untoward fate was in store for him. Westerly gales drove him right across the Atlantic to the coast of Ireland, where he and his crew are said to have been all made slaves. Consequently, if this story be accepted as authentic, Thorhall had the honour—though against his will—of being the first to sail right across the Atlantic Ocean from shore to shore. And still more remarkable is the fact, that this first voyage from the one continent to the other in a temperate latitude should have been from west to east, or, in other words, from the New World to the Old!

Meanwhile, Thorfinn, with the rest of the expedition, prosecuted his explorations by sailing farther to the southward. In due time they came to a land with great tracts of wheat growing wild, and also many wild vines. Here Thorfinn erected huts and passed the winter season. To the Norsemen, however, it would hardly appear winter, for no snow fell, and their domestic animals were able to procure their sustenance in the fields without any difficulty. Numerous parties of the natives were seen, and, in the beginning of the next spring (1008), they opened communications with the strangers. Their furs and skins, of which they had many, they eagerly bartered for cloth or any trifling articles new to them. At this time there happened a most interesting event in the history of America—Gudrida, the wife of Thorfinn, was safely confined of a son, who had thus the proud distinction of being the first native-born American of European parents. He received the name of Snorré, and among his lineal descendants are included Thorwaldsen the famous sculptor, and Magnussen the well-known Danish savant. After some further exploring expeditions, in which he experienced various adventures, including several fights with the natives, Thorfinn and his party sailed back to Greenland. Neither he nor his American-born son seems ever to have returned to the New World. They both settled in Iceland; and the grandson of Snorré, who adopted a clerical profession and was made a bishop, was a man of great learning. He it is who is supposed to have been the writer of the Sagas, or accounts of the voyages and adventures from which we derive our information of the Norse discoveries in America.

The next account we have is of a voyage in the year 1011; and after that there is a great gap of about a hundred years before we find any other expedition mentioned. Although there are no written accounts of any visits to the American coast during this period, we must not hastily conclude that no communication was kept up. There is an account of another voyage to Vinland in 1121, and doubtless many other visits were paid in the intervening years, although no written particulars are now extant. After this period, the intercourse with the New World would seem to have been suspended, and its existence even forgotten, as we are told a new land to the west of Greenland was discovered in 1285 by some Icelandic missionaries. Probably, this was Newfoundland; and the last voyage we have any account of is one from Greenland to Woodland in the year 1347.

Such is a condensed account of the contents of

the Icelandic manuscripts; and there seems no reasonable ground for contesting the truth of the documents. When we consider the character of the hardy Norse mariners and their other distant maritime expeditions, we need not wonder at their venturing so far to the westward. The distance from the southern point of Greenland to the coast of Labrador is only some six hundred miles, little more than the distance from Norway to England. The daring spirits of the north, with whom adventurous expeditions were a passion, and who carried their plundering raids into the Mediterranean, and ravaged its coasts even to the walls of Constantinople, would consider it mere child's-play to run a few hundred miles south-west from their settlements in Greenland. In fact, a greater wonder would have been had they failed to run their long keels somewhere upon the American continent. The most extraordinary circumstance in the whole affair is not their finding but their losing the New World. Their reason for abandoning such a magnificent heritage cannot be fathomed. Possibly, the occurrence of some striking event in Europe—such as the conquest by the Norsemen of that portion of France since called Normandy, and which formed a rich and convenient colony—distracted the attention of the home authorities, and drew their energies into different spheres of action. The absence of sufficient attraction in the shape of plunder would also deter the wild Norse rovers from troubling themselves much about the new countries. Peaceful colonising schemes were not to their mind, and they had full scope for practising their favourite occupation of raiding among the wealthier nations of the Old World. Had the Icelandic explorers only continued their efforts, and penetrated a little farther to the south, in all probability the result would have been different. There they would have found a nobler and more civilised race of men. Gold, silver, and precious stones would have been met with in abundance; and a country producing such commodities would certainly not have been so neglected and forgotten.

What might have been the results in shaping the destinies of both the Old World and the New, had the discovery of the vast extent and unbounded wealth of the Americas been made five centuries before Columbus lifted the veil, it is impossible to tell. One cannot help thinking, however, that had the subjugation of the native races been then attempted, the gallant warriors of Mexico would not have succumbed so easily as they did before Cortes and his handful of Spaniards. There would have been more of an equality in the contest, as firearms were not then known, and there is no doubt it was this advantage which gave the merciless conquerors their easy victory. The native empires of America would have had ample time to prepare for the struggle, and in the meantime the intercourse opened up with European nations would have accustomed them to other modes of warfare, and enabled them to profit in various ways from the more advanced civilisation of the East. Then, possibly, instead of being deprived of their lands by strangers, and they themselves doomed to practical extinction as a race or people, the native races of America might have retained

the greater portion of their vast territories in their own hands, and founded native empires in the New World unsurpassed in wealth and power by those of the Old.

## RICHARD CABLE, THE LIGHTSHIPMAN.

### CHAPTER XXXI.—GHOSTS.

A WEEK passed, and Cable did not reappear at the Hall. Josephine hardly expected that he would, but she half—more than half—wished that he would. He had loved her; she knew that, and it mortified her to think that his love had died so easily. She did not wish to live with him on the first footing; but she did not desire to part from him in anger and unforgiveness. She made no second attempt to see him. She nursed her resentment at the injustice she conceived he had shown, and hugged herself in her pride. It was not for her to step down to him. She had asked his pardon, and he had refused it. Now, he must come to her, and acknowledge that there had been fault on his part.

Mr Cornellis said not a word. Everything was progressing as best accorded with his wishes. He might spoil, he could not mend matters by putting his finger to them. Josephine's indiscreet marriage and this speedy separation were most convenient to him. She was married to a man who could not interfere with him. He was left with the Hall as his home, and Josephine's fortune pretty well at his disposal. A husband of her own class of life would have taken the management of her affairs into his own hands, and would have required him and Judith to find some other home.

He did not understand Cable. He had visited him without mentioning it to his daughter, and had made him a handsome offer to induce him to leave the place. His offer had been indignantly rejected. Why, Mr Cornellis could not see. He supposed that Richard wanted to make better terms, and he was ready to offer them, but waited to see whether, on reconsideration, Cable would not come to his terms. Like all unprincipled men, he was incapable of admitting the existence of noble springs of action in others.

One morning, he came into the parlour with real surprise and perplexity in his face. 'Josephine,' he said, 'what do you think has happened? That Poor Richard of yours has given us the slip; he has gone off with all his goods and chattels.'

'Gone, papa!'

'Gone, and joy go with him—gone in the yacht. He has kept the plan to himself. Last night, he cleared out, live-stock and all, his mother and all the litter; and the vessel sailed this morning early; she went out with the tide.'

'Papa!—you do not mean this! Gone! Gone whither?'

'That is more than I can say; let us hope, to explore the North-west Passage. We will send no expeditions after them. If the polar bears eat them, may they find the Cables great and small to their taste; they are not to ours.'

Josephine made no response. She was too surprised to speak, and not a little distressed. Richard gone, and gone without a farewell—gone

for how long? Gone, possibly, for ever. Something rose in her throat and choked her. It was well, perhaps, that he had departed; but it was not well that he had gone without taking her hand in both his, looking into her eyes, and then, with broken voices, asking each other's mutual forgiveness for the past mistakes and estrangement.

After remaining for some time silent, thinking, and half disposed to cry, Josephine said: 'Papa, do make inquiries. I must know whither he is gone; I cannot endure uncertainty.'

'You will not charter a vessel and sail after him?'

'No, papa; but I want to know where he is. Has he left no message, not a note, for me?'

'Not a word, which is perhaps fortunate: a word would have been pronounced, and a letter spelled, wrong.'

'Don't speak like that, papa—it—it pains me.'

'Indeed! You have become sensitive very suddenly.'

There is a kind of woman widely dispersed throughout the civilised world who not only eats nothing but veal, but looks upon it as her proper destiny to bleed calves and reduce their flesh to a condition of veal. To their minds, veal is the only allowable food: the woman who touches beef is to be shunned as a dangerous person. To suit the taste of these women, everything must be reduced to a condition of veal—the lifeblood, the colour, the warmth, be bled out of it. These women precipitate themselves, as by natural gravitation, into the arms of ministers of religion, because they find in their minds the nearest approach to intellectual veal, and listen in sweet complacency to their sermons, which are elocutionary veal. Their favourite reading consists of insipid and harmless novels, in which is neither fire of passion nor spark of originality. To feel deeply, to think independently, are to them tokens of a beefy nature, demanding the lancet and the letting of blood. They delight in pale colours, half-tints, weak morality, milk-puddings, and afternoon teas. If they could get their tea to draw without the water being raised to a boil, it would please them well.

A century ago, every man went to the barber in spring and was 'let blood;' and our grandmothers all underwent a similar veal-producing process, morally, spiritually, mentally; nowadays, a few dashing calves kick up their heels and frisk about the field and refuse to submit to have their jugular cut.

All respect to the good women who go about with their lancets and little measures for blood; veal is an excellent meat; we must be thankful to them for producing it; but they exceed their province, they excite our remonstrance, when they insist on our eating nothing but veal. The best meat may pall on us when we have no variety, and to some stomachs, veal is positively indigestible. But these veal-eating women are apt to be censorious, and to condemn everything that contains all but a modicum of blood.

Aunt Judith was a veal-eater; she was a worthy woman, of narrow intellect and commonplace mind. Her brother was somewhat of a trial to her; her niece, a very grievous one. The boldness of character, the independence of thought

in Josephine, frightened her. She could not understand her brother. More than half his sarcasms glinted off the surface of her mind, incapable of receiving them and feeling their point.

Josephine sat with her aunt in the afternoon, but was scarce conscious of her presence. Her mind was away on the sea, following the yacht over the blue waves and the foaming white horses. In which direction were the bows turned? What was the plan in Richard's brain?

It is a strange fact that a woman rarely appreciates the force of her own stabs. She regards the wounds she deals as light matters, to be easily patched over and quickly healed. That they should go down to the bone, be liable to fester—that they should leave permanent scars, never enters her head. So now, Josephine laid little weight on the provocation she had given; and she resented the conduct of Richard in leaving her without an interview, as an undeserved injury.

Aunt Judith broke in on her reverie by saying: 'I wonder when Mr Cable will return. Perhaps he has taken the children a sail for change of air. I feel a want of a change myself.'

'I do not think he will return,' said Josephine. 'He has taken the furniture of the cottage with him.'

'What has made him do that?'

'He is no doubt going to make a home elsewhere.'

'Why should he leave Hanford?' asked Judith.

'He has been uncomfortable in this house; he is not accustomed to the restraints of our mode of life,' replied Josephine.

'Uncomfortable! The dinner has always been well cooked. What more can he desire?'

'It was not the food which disagreed with him.'

'It is a pity that he should go, considering who he is,' muttered Judith Cornellis.

'Who he is? He has been a fish out of water.'

'I do not mean that,' said Aunt Judith. 'Considering who he is, he ought to be here. Of course he has told you about himself and his origin?'

'I do not understand. Of course I know'—

'Then you know that in common justice he ought to be in this house. I think Gabriel behaved very badly in the matter. I know I have not much cleverness; but I can see that Mr Cable has been hardly treated. Your father says that man is an intelligent animal, and woman also—intermittently. I suppose I have an intermittent interval of intelligence now and then; and it does seem to me very hard on Richard Cable that he, being the son of Gabriel Gotham, should not have this house and estate as his own; or, at all events, that he should not have been provided for independently.'

'Richard—Gabriel Gotham's son?'

'Yes, of course. He must have told you the story. Your father did not wish you to know it before you were married; but now that you are Mrs Cable, there is no objection to our talking about it.'

'Richard never said a word about this to me. I am quite sure he did not know who was his

father. Yes—I am positive—he told me that himself; and he never said what was false.'

'He did not know? Nonsense, my dear; of course his mother told him.'

'Aunt, I am convinced to the contrary. You do not understand Mrs Cable. She is very proud, as proud as if she were a lady. And Richard feels so delicately, that I know he would ask her nothing.'

'Mrs Cable always was a proud and reserved woman. She refused a very handsome allowance that was offered her by the family, when the marriage was annulled.'

'Gabriel and she were married?'

'Yes; they were married in Scotland. He ran away with her from Newcastle. It was an unusual course, and therefore very wrong, and it brought after it the natural consequences of all wrong-doing.'

'But, aunt, how is it, if they were married, that Mrs Cable did not live with Cousin Gotham and bear his name?'

'Because the marriage was annulled. By Scottish law, those who are married must have resided a certain number of days in the country. They had not been the full time by five hours, so that the marriage was declared illegal.'

'But—how monstrous!—why did not Cousin Gabriel come with her to England and get married again? That would have made all right.'

'He found that he had made a mistake; and he took advantage of the legal flaw to slip out of the marriage.'

'But—Aunt Judith—the child—I mean Richard?'

'My dear, of course, as the marriage was invalidated, Richard was illegitimate. The marriage was annulled before he was born.'

Josephine started from her chair and went to the window.

'When Gabriel married Bessie Cable, he was young and inconsiderate, and soon discovered they were an ill-assorted pair. His father and uncle used their influence, and he made no objection to a separation.'

Josephine's face flamed. She stood at the window looking out.

'You see now what I mean,' pursued Judith Cornellis. 'If it had not been for that slip of five hours, Richard Cable would be Richard Gotham and Squire of Hanford.'

'It was infamous—infamous!' muttered Josephine.

'I cannot say that it was right of Gabriel not to acknowledge him, or at least to leave him a provision in his will. But then—as you married Richard, all seemed to settle itself practically, and the injustice to rectify itself; but now, all is wrong again. You perceive, my dear, how wrong it is to take a course which is unusual; it lands in all kinds of difficulties.'

'It was infamous—infamous!' repeated Josephine.

'I would hardly use so strong a term,' said Miss Cornellis. 'It was inconsiderate, perhaps, of Gabriel Gotham, and a little failing in justice to Richard Cable. But perhaps Gabriel considered that as Bessie Cable refused everything that was offered her, she might influence her son to adopt the same obstinate and unreasonable conduct.'

'She comes out best—far, far the best in the whole ugly story,' said Josephine vehemently. 'How could Cousin Gabriel be so base—so shabby?'

'My dear, it was a most unsuitable match. If you and Richard had been married in Scotland, and there was a flaw of five hours, would you not be glad now to seize the occasion?'

'No, no! It was despicable; it was taking advantage of the poor woman's ignorance.'

'I am sure that Gabriel was equally ignorant at first. It was only when the matter was looked into, that the flaw was found.'

'Aunt,' said Josephine, crossing the room, pulling a withered flower out of a vase, then going to the window again, and then to the table to arrange the books—'aunt, I feel like a robber. I have driven Richard away out of this house. I have taken all the money, all the land, everything to myself, which by equity belongs to him.'

'I wish you would not dash about in the room like a bird that has got in and cannot find its way out. Sit down, and talk of this matter easily.'

'I cannot. I cannot keep my hands or my feet quiet. I am tingling in all my nerves. I feel as if I had committed a dreadful crime. If I tease you, I will go out. I must speak about this to papa.'

'My dear—on no account!' exclaimed Miss Cornellis, in a tone of alarm. 'He would be very angry with me for mentioning it to you.'

'But why was I not told before? How long have you known this?'

'Oh, for many years. It has been a family scandal, that has been hushed up.'

'I ought to have been informed of the circumstances. I would never have accepted Cousin Gabriel's estate.'

'You could not help yourself. It was left, not directly to you, but to trustees for your use.'

'It was wrong in you, in my father, not to tell me everything. I cannot remain still. I irritate you with my pacing about. I cannot help myself. I must see papa.'

'He is out now, and will not be in for some hours.'

'That is as well. I will go to the wind-strew and sit there. I am so agitated, so angry, so surprised. This is sprung on me. I have been shamefully treated. I ought not to have been kept in ignorance.'

She swept out of the room. She felt the necessity for being alone. This strange revelation was fraught with consequences not to be gauged in a minute. What was that which Mrs Cable had said about the cuckoo turning the little birds out of their parents' nest? She was the cuckoo; she had taken to herself the nest that of right belonged to Richard; she had done more—she had driven him, his mother and children, out of their own modest cottage, as well. Could she sit still and ruffle her plumes, and spread her feathers, and occupy the nest that was not hers by right, leaving them outcasts?

Why had her father kept the secret so closely from her? She shrank from the conclusion. Why, knowing what he did, had he counselled her to insult her husband and drive him away?

She shrank from the answer she made to herself. At once, with great determination, she resolved not any more to ask advice of her father and be guided by his opinion. She must think out the situation for herself, form her own resolution, and act on it, in defiance of every remonstrance from him or Aunt Judith. *He* would stand in the way of her doing what was just, and *she* would object to what was unusual. Josephine sat on the windstrew, her head spinning, hot rushes of anger sweeping through her arteries, followed by cold qualms of heart-sickness. As she thus sat, her fingers plucked at the breasting of bricks, peeled away flakes of velvety moss, scratched out scraps of mortar, picked away chips of brick, and flung them over the unprotected side among the broken potherds. She looked over and saw a mouldering collection of garden refuse—old geranium roots turned out of their pots, and half-decayed flower-sticks, the fragments of a shattered garden vase of terra-cotta, the accumulation of years of broken flower-pots—a home for the slug and the centipede and the wood-louse. This was the bed on which Gabriel Gotham had fallen, a bed that truly symbolised his mind.

Josephine could not shake the thought of Gabriel out of her head, now that she had looked on the place where he had fallen and met his death. As she sat on the windstrew, with the smell of decay steaming up from the refuse-heap, his feeble, shivering ghost seemed to rise out of it and shake its hands deprecatingly, and jabber an appeal for pitiful consideration. She had been throwing the bits of mortar and brick down where he had fallen, and with them had cast hard and reproachful thoughts at the dead man. She could not thank him for what he had done for her; he had enriched her at the cost of a gross injustice committed on his son. What an utterly mean, selfish creature Gotham had been! His roundabout way of compensating Richard through her had been on a par with all his tortuous methods through life.

She could not endure to remain on the windstrew surrounded with sights that brought Cousin Gotham before her; she would go to the cottage, to a healthier atmosphere, and satisfy herself whether her father had spoken the truth. It was possible that Mr Cornellis, in all things false, had deceived her in this particular also. So she went out at the garden gate and along the seawall. This was her shortest way, and it suited her best. She did not wish to be seen in the road; she thought that every one she passed would look reproachfully at her. She could not endure to encounter their eyes. She went along the wall to the sandy path that led from the village to the shore, then by the moat to the bridge, and over the bridge into the garden. All was there as if nothing had occurred. The beds were in beautiful order; the vine on the roof showed a hundred little bunches of swelling berries. This year, no little children would sit upon the stages of the ladder, looking for the purple fruit their father would pass down to them. She had spoiled that pleasure for them. There was the slope with the bed of thyme and marjoram and mint, where the little ones sat in the sun, and baby Bessie went to sleep

with fragrant herbs crushed in her little hands. She had spoiled that pleasure for them likewise. The scarlet-runners that Richard had staked were in bloom, in scarlet, and there were no little eyes to admire the lovely flowers.

She went to the house and tried the door. It was fast. But she knew how that there was a loose pane in the scullery window beside the back door, which could be removed, and the hand thrust in and the bolt drawn back. Cable had told her of this contrivance, by means of which he could enter his house at all times without disturbing the inmates. She removed the pane, and easily unfastened the door. Then she entered. The house was deserted, and almost wholly cleared of its contents; but it was unlike most abandoned dwellings, for it had been cleaned and tidied before it was left. The few things that remained, hardly worth removal, had been placed in order. There was a plain solid deal table in the centre of the kitchen that had not been removed. Against the wall, in the corner, was the cradle, reversed, the rockers upwards. 'How like Richard,' thought Josephine. 'He has turned the little crib over, that the dust may not fall into it.'

He had not taken the cradle away. Bessie was grown almost too big for a cradle, and he would never have another baby. A slight quiver passed from Josephine's heart to her fingertips.

The brick floor had been swept, the hearth tidied, the cinders were brushed into a little heap. Something white showed among them. Josephine knelt on the dead hearth, put her hand to the ashes, and extracted some scraps of card. They were her mounted cabinet photograph, torn twice across, downwards and sideways, with a firm hand. So had Richard taken the thought, the memory of Josephine, out of his heart and cast it from him for ever. A pang shot through the breast of Josephine, as though his hand were on her heart and were tearing it twice across, downwards and laterally. She threw the scraps of the despised portrait on the ground, then stooped and picked them up. 'He would not wish any scraps—even these—to litter about,' and she replaced them among the cinders.

There was no resentment in her bosom now; all her wrath against Richard had died away; her sense of wrong was swallowed up in the thought of the great injustice done to him.

She wondered whether she could find anywhere in the house a photograph of himself. She had never seen one. He was too modest to think of being taken; but it was not improbable that his mother had insisted on his being photographed when he was younger, and there was a chance, a poor chance, of a copy being left behind. She ascended the staircase and looked about the bedrooms. There were nails in the walls where little looking-glasses and pictures and texts had hung; but there were no photographs; nothing left but the nails, and one illuminated text, 'When all these things come upon you—then LOOK UP.'

The bedrooms were quite empty; the floor had been recently washed, and had not a foot-mark on it. The blinds had been removed from the windows. The rooms looked utterly forlorn. She came sadly down-stairs again.

In a corner of the kitchen was a shelf with drawers let into the wall—a fixture, therefore not removed. On the shelf was a bundle of old clothes of the children, neatly pinned together—rags, no longer fit for wear by them; and in the drawers was a small straw hat, tied up in Richard's blue pocket-handkerchief—that handkerchief at which she had sneered. The little hat had perhaps been forgotten; perhaps it was not wanted, and Richard had left purposely the handkerchief, which would remind him of one of his wife's sarcasms. She unknotted the ends of the kerchief and took it in her hand.

From the ceiling in the kitchen, depending from a crook, hung a fresh bunch of everlastings, pink-and-white flowers of that summer, not yet dried—hung head downwards, that they might dry expanded. Then Josephine's heart swelled up, and she choked. Hastily she drew the inverted cradle from the wall and put it near the table, under the tuft of fading everlastings, and sat down on the cradle, between the rockers, and put her face into her hands and wept. It was as though the spirit of Richard Cable rose before her out of the cold ashes on the hearth, from among the torn fragments of her own likeness—not the spirit of the wounded, angry, unforgiving, despairing man, as she had last seen him, but as of old, gentle, humble, full of divine trust and love.

She cried long; her own little white handkerchief was soaked, and she wept tears of bitter self-reproach into the great blue dishcloth she had so scorned; and when the fountain of her tears dried, then she held the kerchief to her aching heart, and presently again buried her face in it. There was naught ridiculous to her now in the blue handkerchief with its white spots.

## HOW MISERS LIVE.

MAN is, and always has been, a very curious compound. Some men seem born to spend, others to conserve. This has been the state of matters from the beginning, and the causes originate in the mind of man himself; he is their father; his affections and will are the faculties which become the obedient instruments of the nature we call thriftless or sordid.

The nature of the spendthrift is easily understood—at least so it is said; there is so much of simplicity and of recklessness in it, that we generally identify a spendthrift with a good-natured fellow. The miser, on the other hand, is an enigma and a mystery. He is one of the anomalies and absurdities of nature. Dickens with his pen and Angelo with his brush have portrayed to our minds their ideal miser. Money is his sole aim; the man within him and the world of humanity around him are but as dust and rubbish compared with his golden pieces; for the miser seldom takes paper in lieu of hard cash.

But we must not despise the miser indiscriminately; let us rather attempt to lift some of them at least from the degraded position they have always occupied in the public mind. It may

never have occurred to our readers that the desire to be philanthropic has induced some men to become misers. Nevertheless, this is the case, although we may not have had frequent opportunity of verifying this experience. Thus, when Bethlehem Hospital, London, was built, a wretched miser of the East End gave a subscription of one hundred pounds. When the collectors called at his residence, they found him scolding a servant for throwing away a match which had not been burned at both ends. To him, the waste of this match was a worse blow than the giving away of such a large sum. Gurgot of Marseilles was another confirmed miser; every one in the city knew him, and it is not exaggeration to say every one hated him for his sordidness. Yet, we know from his will that he scraped together ten thousand pounds in order to furnish the poor of his native town with a good and cheap water-supply.

Every class of the community supplies subjects for the miser list. This at first sight appears strange. Suppose we take the nobility and clergy—classes which we would fancy should be free of such sordidness; and we find that even amongst these the malady is very rampant; indeed, the nobility have supplied, and do supply, most of the miser tribe. There have been few soldiers like the first Duke of Marlborough, and yet he was a very sordid individual. To save a sixpence for carriage hire, he would walk, when an old man, from the public rooms in Bath to his hotel, in all kinds of weather. He died worth one million sterling, which he left to his grandson, Lord Trevors, his bitterest enemy.

There seems to be a certain irony of fate in the miser's pains to collect money, for generally the produce of his mean and sparing living falls into the hands either of thriftless sons or bitter foes. In spite of the knowledge of this, the poor miser grasps and gathers together all he can lay hands upon, thus adding day by day to his physical and moral ruin. The life of Vandille more than justifies this statement. This man's food consisted of bread and milk, with the addition of a glass of sour wine on a Saturday; his religious mite was one farthing per week, and at his death he left eight hundred thousand pounds to the kings of France.

One redeeming feature of the miser's character is that he generally suffers the effect of his sins himself. He does not punish others. One exception to this rule is the life of Audley, who flourished in England during the Commonwealth. This miser started life with two hundred pounds, which sum he lent out to the sons of cavaliers and to clerks at a high rate of interest. His whole life was one of cunning and disreputable craft, and by such means he accumulated four hundred thousand pounds, which, however, reverted to the government.

The keen and earnest craving for money does not belong to individuals only; it has often been characteristic in the life of nations. The South Sea Bubble in our own country showed what

thousands would do in the worship of mammon. But the tulip mania of Holland in 1634 surpasses every other illustration we are able to cite. Such was the rage for tulips that they rose to enormous prices. To possess tulips was to be rich. One of these flowers, named the Admiral Liefken, was worth at market value four thousand four hundred florins; and the Semper Augustus brought five thousand five hundred florins. If another mania should arise, would not there be found thousands of men and women thronging to swell the sordid contingent? Such incidents as these in the life of a nation show that running through the whole of society there is an undercurrent of sordidness, which becomes direct and strong when once the floodgates of public opinion open their folding leaves. There may be a difference in degree between the confirmed miser and those men who delude and are deluded by tempting baits, but the cases are of the same kind.

The miser is very often unconscious of his meanness, and even rejoices when he sees any other man display the same quality. The biography of Dicheus Dichæus shows this conclusively. This person was a descendant of the Byzantine monarchs; but their spirit of lavishness was in no way inherited by him, for during his lifetime he managed by niggardliness to raise the value of his possessions to many thousands of pounds. The great question of his life was, to whom should he leave his money? This problem was solved for him by means of a rather curious incident. A distant relative of his sent him a letter written on an inch of paper. This was enough; the miser seemed to see in his absent friend a fitness which fully warranted him in making this apparently thrifty person his heir.

The habits of the miser are peculiar in the extreme. The Rev. Mr Jones of Blewbury may serve us for a pattern. With a stipend of fifty pounds per annum, and blessed with a fortune amounting to two hundred pounds, he left at his death the sum of ten thousand pounds. For forty years he was rector of Blewbury, and during that long period only one person was known to have sat at his festal board. He never had a fire lit in his house, and as for servants, the very thought of them was enough. During winter nights, he used to go to the houses of his parishioners in order to keep himself from starving of cold, rather than light a fire at the rectory.

When the miser dies, his possessions are often found in the most out-of-the-way corners. Mr and Miss Dancer are reputed to have been the most noted misers of the eighteenth century. To tell all their habits would be interesting, but rather tedious; let the manner in which they kept their money suffice. Their fortune amounted to twenty thousand pounds, which sum was stored away thus: two thousand five hundred was found under a dunghill; five hundred in an old jacket nailed to the manger of their stable; notes amounting to six hundred pounds were stowed away in an old teapot; and many old jugs filled with gold and silver were hidden away in the stable loft. The chimney yielded two thousand pounds. In this dirty place there were nineteen holes, each of which held a sum of money.

There is without doubt a very complex nature

in the man or woman thus addicted to grasping; but the facts and phenomena are so varied that it is difficult to place them under any fixed principle.

## CHECKMATED.

### CHAPTER IV.

DAVID's strange visitor had not been gone many minutes, when a knock at the door announced the return of his daughters; and presently, Josie and Minnie entered, all full of pleasant excitement and merry innocent talk, with satire from the younger—a contrast positively awful to the interview and conversation he had just held. His daughters, however, were not likely to notice his embarrassment; there was so much to be said and thought in reference to Geoffrey's return. The friendly neighbour's utterances, too, were quoted, especially with regard to one point on which Minnie took great delight in dwelling.

'And so, father,' continued Minnie, 'Mrs Harper said: "It is quite plain that Josie has two strings to her bow." So she has, and she is fretting all day long because she does not know which to choose.'

'Minnie!' exclaimed the elder sister, in a tone of dignified reproof, calculated to repress all such levity, but which somehow missed its mark upon the present occasion.

'Why, you know, father,' persisted Minnie, 'we half promised to dine with Mr Gadham at the *Grand Rosary*, and then afterwards to go to the theatre. Perhaps this will come off on the very day that Geoffrey arrives. I tell her she ought to make up her mind at once. Don't you think so, father?'

'It was the 20th; I recollect it perfectly!' exclaimed David, who had been forcing himself to pay a little outward attention to his daughter's talk, but whose mind had been busy with his own painful recollections, until a ray of remembrance had enabled him to verify the statement of his visitor. 'I beg your pardon, my dear,' he continued; 'I was thinking of something else. You said you were going to dine with Geoffrey, I think?'

This produced a laugh from each of the girls; then Minnie had to explain what she did say, and again appealed to her father for his opinion. Josie, although she rebuked her sister for such giddiness, was evidently flattered at being supposed to occupy such an enviable position, and while probably as true and as much attached to Geoffrey as any sweetheart could wish, yet could not help a longing glance or two at the brilliant position waiting her acceptance.

There was the reader may be sure, a great deal more of this conversation, poor David being in agony while it lasted, and finally making his escape under a plea of headache and a desire to smoke his pipe in the open air.

His meditations, as he slowly paced to and fro in the quiet street, were no less bitter; even the chatter of his girls had helped to open his eyes more fully to the horror—it was nothing less to him—of his position. What did Ernest Gadham mean by his advances to his daughter and his intimated offer of marriage? It was impossible for David to decide which would now

be the most repellent, whether to find the man in earnest, or merely playing a part. Above all, what was he to do? That he would not remain a tacit partner in the conspiracy, was certain; but it was not so easy to decide upon the best way of going to work. He might go straight to the firm and expose the plot. Much as he disliked the new people, David was quite capable of acting justly by them; or, perhaps it would be best to go in the first place to Ernest and tell him and his lawyer of the discovery he had made. His last resolve, as he entered his house after a long saunter, was to do both these things next day. He should have some trouble about the borrowed money—he felt certain of that, but perhaps the firm would help him. 'And if not,' thought David stoutly, 'I would rather have the brokers in and be sold up, than go on with such people.'

The first post next morning brought old David a letter. He did not know the handwriting; but the address was written in a clear, legible, nay beautiful hand, such as he had seldom seen. He opened it. A glance at the signature was enough; he felt as though he was holding some reptile in his hand. The letter was signed, 'Andrew Whitman (Fly Scotty)!' It was addressed inside to

Mr

David Chester.

And underneath was written: 'What do you think of *that* for an imitation? I never forget a name on which I have once worked.' And the imitation was indeed perfect. Even in the shock of seeing how fully the convict was borne out in his story, David could not help admiring his skill. He was sure that he would have sworn to this also as being his own writing.

'I forgot to mention last night a little fact which will help us'—the letter went on ('Us!') The mere reading of this word communicated a fresh shudder to David)—'and I think when I tell you what it is, you will agree with me that we had better begin with Tom Ellitt. I have heard, and am satisfied it is the correct tip, that Gadham is to marry Ellitt's sister. If so, it is plain that this is a part of the bargain. Of course, if you know this, you can work Ellitt easily enough; he will not lose such a chance for a trifle. They may wonder how you got your information; you can tell them it was from me, if you like. I shall take care never to go near them again, so they may do their worst; and I know I can trust you in the money matter.'

The hail-fellow style of this epistle, the palpable confidence the writer felt in Chester's willingness to become his accomplice—these were enough at once to sicken the clerk and yet strengthen his resolve.

To do Mr Andrew Whitman justice, it must be owned that he had not the faintest idea of any wrong-doing being involved in the 'besting' those who were themselves dishonest and willing to 'best' him. Nor did he conceive for a moment that any man of business, especially when possessed of what Mr Whitman so sorely lacked, a good character, could hesitate to join him.

David looked pale and haggard from worry and sleeplessness; but his step was firm enough as he went towards the solicitor's office. Without

any regard to the counsel of Andrew, he had determined on commencing there. He was fortunate in his choice of time, for not only was Mr Ellitt within, but Mr Gadham was with him. The clerk who announced the visitor was told to show him in at once.

The two principals exchanged a meaning glance and smile on hearing the name. 'I told you so,' said Gadham in a low tone; 'I knew he could not resist the temptation; and here he is—prepared to recollect everything and to swear to anything.'

Ellitt laughed at this sally; and then David was shown in.

'Good-morning, Mr Chester,' began the solicitor. 'You asked to see me, I believe; but I thought you would not mind Mr Gadham being present, as he happened to be here.'

'On the contrary, I am glad to see him; it will save me some trouble, as my business is with you both.' He was obliged to moisten his lips with his tongue as he spoke, they were so dry and hard.

'You are not looking very well this morning,' said the lawyer. 'The weather, I suppose, is affecting you, like the rest of us?'

'No, sir,' returned David; 'if I look ill, it is from a more serious cause than the weather.' He not only spoke more firmly now, but there was something in his tone which instantly attracted the attention of the two men who confronted him, both of them crafty and suspicious to a degree.

'Ah! Then what is it, Chester? Speak out!' exclaimed Gadham.

'I mean to do so; I am here to do it. You are trying to pass off a fictitious will as that of the late Mr Gadham, and to aid your schemes, have forged my signature. I disown that signature, and insist upon its being cancelled—at once.'

Ellitt, after a glance at his confederate, bent a searching look on David, but did not speak. Ernest Gadham turned pale, and uttered a low whistle.

'Are you tipsy?' he asked, with an assumption of insolent swagger; there was no reality in it. 'If so, you had better go home and sleep it off, before you intrude upon two gentlemen who have business to attend to.'

'I am not tipsy, and I can see you know I am not,' retorted Chester. 'It will be better to avoid insult, and to understand, once for all, that I know your will is a fraud, and that you have deceived me.'

'Why, you scoundrel!' cried Gadham, who had plainly made up his mind to take a hectoring line, 'have you the assurance to come here and tell us that you have committed perjury?—and I can promise you penal servitude for it—have stuck to it as long as it suited you; and now, some one else having got hold of you, I suppose, who you think will pay you better, you are willing to try a little false swearing on the other side. Is that it?'

'I tell you,' replied David, in whose cheeks a little colour now appeared, as he smarted under these insults, 'that I can see you know better. Since you deal with me in this manner, I leave you to do your best and worst.'

'Our worst, you may be sure of it, will be sending you to the Old Bailey, and that will

be our answer to your first move,' said Gadham. 'Be off!—and move in the matter if you dare!'

'Stay!' exclaimed Ellitt, as David moved from his seat, the lawyer laying his hand at the same time on Gadham's arm, as a warning to him to be silent for the moment. 'This is not a chance shot. This man has not hit upon this means of blackmailing us from his own ingenuity. He has seen Andy Whitman. I am perfectly sure of it. I knew the villain would be up to some treachery, and now we have it.—I do not suppose you will own it, Mr Chester, but I am satisfied you have been in communication with one Andrew Whitman.'

'I have no wish to deny it. I have seen the person you mention, and from him have learned what I have just told you. Had I suspected it earlier, you would have seen me here earlier.'

'You are probably not aware, Mr Chester,' said the lawyer, speaking in a calm tone, yet with an air of superiority, as a person might speak who felt something like contempt at being compelled to discuss a subject so palpably trivial and absurd, 'that this person is a ticket-of-leave man, and, moreover, one who is sought by the police; that he is a man who has lived for years by every kind of fraud; a man whose oath would be of no value in a court of justice, and who is willing, as in the present case, to turn against those who have been his best friends.'

'I saw and heard enough in my only interview with this man,' returned the clerk, 'to convince me that I could have no intimacy with him; but if his account is true—and I have reason to think it is—you are the last persons in the world who should object to his character.'

'Then what are we to infer from your visit of this morning?' pursued the lawyer. 'Do you mean to repudiate your signature—to which, I must remind you, you have sworn—and, further, to declare the will a spurious one?'

'I do,' said David firmly.

'It will be a serious thing,'—began Ellitt; but Gadham interrupted him.

'You may finesse and beat about the bush for a week with such a man as this,' said Mr Ernest; 'I have seen enough of him to know better. I will go straight to the point.—Now, look here, Chester; we are just about to settle with the firm, and so our promises will be as good as ready-money. If you go straight with us, doing nothing, in point of fact, you shall have a thousand pounds in hard cash in your pocket before the week is out. That is the one side. On the other, I give you my word I will sell you up for what you owe me. I have taken the precaution to obtain a writ against you in case of need; here it is; and you shall stand in the dock at a police court on a charge of perjury and conspiracy, if you do go on.—Do not answer now, but take yourself off, and think about it. Come here the day after to-morrow—no, the following day; call about this time, with your final answer. That is all we need say.'

'And remember, if you act fairly by us,'—began the lawyer; but Gadham again interrupted him.

'No, Tom,' he said; 'I mean to manage this in my own way. He knows we shall be liberal. I think he also understands that we can hit hard, and mean to do it.—Good-morning, Chester.'

On this, David, who had looked very serious during these harangues, left the office, not having said anything to confirm the appointment made, although the others no doubt considered he had tacitly agreed to it.

'Let him do what he likes,' said Gadham as the clerk went out. 'The firm will settle to-morrow, thanks to my agreeing to halve the estate; and when once we have the cash in hand, we can laugh at the old fool.'

'It will be as well to keep him on the right side even then,' said Ellitt gravely. 'It may suit you to leave the country, but I do not wish to do so. Besides'—

'Oh, I know what you are going to say,' exclaimed Gadham. 'I will marry your sister the day after the settlement, so that need not trouble us.—As for Chester, he won't know anything of our arrangements. I can tell him we have altered our minds, and are not going on with the business. We may give him his signature back, for the new will must be destroyed, I expect. Anything will do when once we have the money.'

Mr Ellitt's countenance hardly expressed so much confidence as his coadjutor appeared to feel; nevertheless, as it was plain that nothing better might be done, he raised no argument.

Dejected as David had appeared on leaving the conference, his mind was in no degree shaken, although the prospect of a criminal prosecution—and he fully believed in the power of the two men to subject him to this—had more terrors to one of his timid, nervous temperament than to most men; but David, with all his faults and shortcomings, was an honourable old fellow. So he went straight from Mr Ellitt's office to that of Brisby, Gadham, & Co., where he had thought never to set foot again. His dislike to the firm was so great, and his sense of the injustice he had suffered at their hands was so keen, that no stronger testimony to his honesty could be adduced than his overcoming these feelings when he felt it was his duty to do so.

He saw his old friend the head-clerk, whose face assumed a lugubrious expression on recognising David, and who shook his head sadly ere his visitor began his speech. When he found that David wished for an interview on urgent business with Mr Gadham, his astonishment expressed itself in a low but unmistakable whistle.

'I am sure I do not know what to say about it,' he said; 'however, he is in his office, and I will take your message in myself; it may give you a better chance.'

So the kindly head-clerk disappeared; but returned in a minute with permission for David to enter the private office, a permission of which the latter at once availed himself.

'I hope,' muttered the head-clerk as the door closed behind the visitor, 'that he will mind what he says, for I never knew the governor in a worse temper than to-day.' This augured badly for the caller, but luckily he did not hear the comment.

The beginning of the interview was in keeping with the head-clerk's forebodings. 'Well?' said Mr Gadham, looking up from his letters with no very pleasant expression on his features. 'I

thought I had given you a sufficient answer, Chester; but it seems you have something to say to me again. What is it?'

'I am here on your business rather than my own. I am not biased by the treatment I have met with here, or I should not be in your office this morning. My visit has reference to the will of Mr Peter Gadham.'

His listener was evidently startled by this commencement, and in a moment was all attention—attention which did not diminish as his visitor went on with his story.

We need not follow this in detail, for the reader knows what David had to tell. As might have been expected, the recital made a great impression on his listener, who uttered an occasional ejaculation of wonder or indignation.

When David had finished, the merchant said: 'Of course you are prepared to adhere to this statement, Mr Chester. If so, I think I may promise to see you harmless, despite all Ernest Gadham's threats, joined to all his lawyer can do. You are in time, but only just in time, with your communication. Do not trouble yourself about the money you owe these men; I will see to that. You must be here to-morrow morning at twelve—no, a quarter to twelve. I have an interview with these people for that time, when I was to buy them off; but I need not enter upon such an explanation to you. You understand what I want of you?'

'Yes, sir,' said David. 'But you remember that I have an appointment with Mr Ellitt and Mr Gadham on the third day from this. If I meet them'—

'Oh, do not concern yourself with that appointment!' interposed the other impatiently; 'you will find that will shift for itself after to-morrow. If you are, as I firmly believe you to be, a truthful and honest man, you will and must be here to-morrow. Have I your promise?'

'You have, sir,' said David.

Mr Gadham continued: 'Then you had better leave by my private door, as I do not care about your being asked any questions relative to this interview.—Be firm, and fear no one.'

The merchant let David out, as he had said; and the expectant head-clerk, with one or two to whom he had spoken on the subject, were barked of a most interesting gossip, their wonder rising to a high pitch when it became plain that Mr Gadham must actually himself have let the clerk out by his private door, a thing scarce ever heard of.

In spite of the merchant's adjuration to keep up his courage and fear nobody, David was dispirited enough as he went homewards. It was not so easy as Mr Gadham seemed to suppose for him to throw off the dread of a criminal prosecution. He believed—partly from his old recollections of Ernest, and partly from recent revelations—that the two accomplices were capable of endeavouring, by any wickedness, to avenge themselves upon him, and although he might be acquitted, the ordeal would be terrible. Tired in body as well as in mind, he treated himself to a ride on an omnibus, and mounting outside, succeeded in securing the last and only spare seat on the crowded roof. Ere the vehicle had travelled any great distance, it stopped in order to allow a passenger to alight, and this

passenger, in reaching the rear, had to pass David. He was a weather-beaten, broad-shouldered fellow, and as the clerk looked at him, there was something, or so he fancied, unaccountably familiar in the man's face.

Their eyes met, and for a moment there came such an expression over the features of the stranger, that David actually fancied he was about to speak. Nothing came of it, however; the passenger descended the steps, and David watched until he was lost in the crowd of wayfarers who thronged that busy part.

David had been sitting alone for some time in the evening, trying to banish thought, but incessantly picturing all kinds of disagreeable incidents, when suddenly the sound of voices and laughter was heard outside. Then came footsteps crossing his little garden; his daughters' voices were there, but there was another, a man's voice. David hurried to answer the knock; everything, even these cheerful sounds, filled him with trepidation; but as he opened the door, a man sprang forward, seized him by the hand, and the friendly voice of Geoffrey Coyne exclaimed: 'Here I am again, Mr Chester, home, safe and sound, in Old England once more!'

'I am glad to see you, my boy—never more glad to see a true friend than now.'

'Yes; and the beauty of it is that there is no going to sea again for me,' continued Coyne. 'I have made something like a fortune, Mr Chester, and you do not catch me doing the gallant jack-tar any more.'

#### A WEEK WITH THE CORNISH FISHERFOLK.

THERE can be no greater relief and pleasure to persons of sedentary habits, weary of the dust and clamour of busy town-life, than to get away from the scenes and associations of their ordinary occupations. Following in the track of a young artist-friend in search of the picturesque, we found ourselves, after a somewhat tedious journey, snugly ensconced in a comfortable sitting-room at St Ives, an artist-haunted spot, perched on a rocky promontory some miles north-east of Land's End. The ancient little town is unique in the beauty of its situation and surroundings; and on a fine day—and all the days were fine—when the quaint gray houses are shimmering in the pure sunlight, and the silver and green of the sea lap the many-hued rocks and creamy yellow sands, it is especially charming. Standing on the 'island' by the little fortress of Pendinas, one sees to the right, point beyond point, the bold headlands of the Cornish coast. Before us is the broad Atlantic, its now peaceful bosom flecked with white or brown sailed fishing-boats; and to the left, or south-west, are the precipitous cliffs that terminate in Tol-Pedn (the holed cliff) and Land's End. St Ives itself is full of surprises, and abounds in the groupings and incidents which artists most admire. Narrow, steep, and tortuous streets, with flights of stone steps on either side; quaint gabled porches; mysterious-looking cellars filled with huge casks and hogheads; gray-green shingled roofs with corners splayed to offer the least resistance to the wild

west winds; swarthy fishermen with loads of tanned nets on their broad shoulders; tidy fishwives with jean bonnets flapping in the breeze; and groups of barefooted children; while every glimpse adown the straitened ways has for a background a vignette of sunlit sea. There are no architectural pretensions, no stucco, no gardens even, here in the old town—simply a mass of picturesque confusion, each little domicile seemingly anxious only to secure a lodgment on the rock, with just a peep of the bay from the open door or latticed window.

But more charming still is the little town and harbour 'tween the lights,' when the sun has gone down behind the purple moorlands. Then the fleet of fishing-boats, with taper masts cutting the sky-line, sway gently with the tide, like a bevy of ancient dames in a stately dance, while the harbour-lights dip down into the deep blue like moorings of golden chains. Middle August is the least busy season, as upwards of six hundred of the fishermen are away in the North Sea or along the Irish coast drift-fishing for herring. Nevertheless, morning after morning, except Sunday and Monday—not a keel moves on the Sunday—the little quay, constructed by the famous Smeaton, is covered with glittering spoil, laid out in rows to await the fall of the hammer, and be forthwith despatched to London, Bristol, and the great towns of the Midlands and north of England.

There are mostly a few boats employed in the drift-net fishing for pilchard; but the greater number are engaged in tackle-fishing for conger, cod, ling, skate, ray, &c. Judging from the size of the monsters captured sometimes, this line-fishing must be laborious work. The conger is not an easy creature to handle; it has a way of coiling itself round anything near, and it finds frequently the legs of its captor are most convenient; its grip is so tenacious, that the head may be entirely severed from the body before its hold is relaxed. It will even hold on to a knife in this way. A visitor standing by at a sale noticed one twitching slightly while lying on the quay, and foolishly touched its head with his foot, when the creature's mouth suddenly opened and seized it. He assured me that the recovery of his foot was a difficult, painful, and eventually a bootless task. On another occasion, a practical joker induced a black retriever to wag its tail in close proximity to a conger's mouth. The appendage was promptly seized, and the horrified dog scampered through the streets yelling piteously as the huge eel held on firmly behind. At this season, the conger finds the readiest sale, lots of forty to fifty, averaging a score pounds-weight each fish, selling for forty to fifty shillings. Skate are mostly consigned to Paris, where they are used extensively as food by the poor, and also at the restaurants to thicken soup. It is asserted by some, by the way, that both conger and skate are used extensively in the manufacture of 'turtle' soup. Of skate, we saw half a ton, fresh caught, sold for seven shillings. It must be remembered, however, that the small price would be increased tenfold ere it arrived at London, by carriage and salesmen's charges. Of the dogfish—apparently a species of shark—which follows the shoals of herring and pilchard, lots of forty or more, averaging eight to ten pounds-weight a fish, sold for half-a-crown. These are purchased by the poorest inhabitants, opened, salted, and

dried for winter provision. The ray, however, another species of flat-fish, is most commonly used as food by the fishermen's families. The visitor will note how frequently it hangs on the fronts of the cottages; it is always removed, however, during the hours of Sunday. A ray of six pounds may usually be purchased for three-halfpence or twopence. It is this seemingly inexhaustible and never-failing supply of 'bread' from the waters, cheap vegetables, and a mild climate, which render it possible for the poorest to live. Of fish, besides the foregoing, ling, cod, gurnet, and tub were most plentiful. The last-named is of a brilliant orange red.

The Cornish fishermen are a splendid race; sober, industrious, and God-fearing. The Sunday is invariably kept with decorum and solemnity, and their huge barn-like chapels are crowded. During my week's sojourn among them, I neither saw a tipsy person nor heard an oath. There is no 'larking,' no horseplay, no music-hall songs. The whole nature of the people seems to be chastened and subdued by their uncertain, hazardous, and laborious calling, and the ever-abiding presence of the great wide sea. For hours and hours they will stand in little groups on the quay or beach, talking gravely, in undertones; or gazing intently on the scene before them, speculating on the various craft that glide past as in the silence of a dream.

It is an interesting spectacle when the boats arrive in the morning after the night's tackle-fishing. Each boat is pulled quietly in, and put in place, without noise, hurry, or confusion, by the quay-side. There is no swearing or angry chiding; all is done earnestly and quickly, with a sober dignity of manner, and without the least affectation or seeming consciousness of being scrutinised by the groups of visitors, artistic or otherwise. The whole scene is a succession of charming marine pictures, every incident and figure in which is harmonious and true. In the spring mackerel season, when the great glittering heaps of fresh-caught fish are flashing with iridescent colours—silver and ultramarine, lake and purple and emerald green—the quay is busiest.

A few years ago, however, the principal branch of the industry was the pilchard-fishery, carried on by means of huge nets called seines, several hundred yards in length. The pilchard, or, as it is sometimes called, the gipsy-herring, is a fish differing but slightly from a small herring. For years it used to appear off the Cornish coast with great regularity in such incredible numbers that the shoals covered sometimes many acres in extent. There was a take last autumn; but in the previous year, none were caught. The pilchards usually appear about the end of September or beginning of October; but owing to some cause, at present not clearly ascertained, the pilchard-fishery is almost a failure. Some of the natives ascribe it to the disturbance caused by steam-trawling. The St Ives fishing seasons are the winter mackerel season, the spring mackerel and the pilchard season, the last-mentioned commencing in September and ending in December. These are the principal seasons, though fishing to some extent goes on all the year. Last year, as we said, there was a small take of pilchards; the year before, none were caught with the seine. The year before that, one seine was fortunate,

and brought to its owners and crew over four thousand hogsheads, worth about eleven thousand pounds. There are several Companies, each owning a seine; but latterly, by mutual agreement, only one has been out. As many as six thousand hogsheads have been taken by a single seine in the more prosperous times of the fishery.

We will describe the scene as witnessed from the little huer's hut by Pothminster Head, just beyond the town, though the immediate neighbourhood has been modernised, and therefore deprived to a great extent of its picturesque surroundings. There was a narrow path by the edge of the cliff, margined with cushions and thickets of gorse and heath and bracken. An old tarred boat, keel upwards, serves for shelter, and also as a receptacle for necessary gear, among which, hanging on the whitewashed walls, are the huge speaking-trumpets called into requisition by the 'huer,' or watcher—so called from the French *huer*, to shout. The huer is a stalwart man of sixty. His face is wrinkled and weatherworn; but his light-gray eye is as keen and searching as ever. For weeks he has paced that narrow path day by day, until well-nigh sick with the hope deferred. Below, to the left, on the sandy beach, there is a fleet of boats high and dry. A few fishermen lounge about, some watching by the low seawall; others are asleep. Two hundred yards out is a larger boat, manned by nine hands. There is a high square heap, covered with tarpaulin, in the front of it: this is the big seine, and the men are the seiners, who are paid so much a day, with a promised share in the take. Behind it is a smaller boat with two hands; this carries a second seine, to be attached, if need be, to the larger one. The huer paces the narrow path, pausing now and then on his beat to scan the wide surface of the rippling sea. He hesitates a moment, and passes on; then turns again, and shields his eyes with the brown wrinkled hands. One long earnest look, and he rubs his eyes and hitches his trousers with quick, nervous action. At last, his doubts are dispelled. Three miles away, by Godrevy lighthouse, there is a reddish purple streak like a sunken granite reef; and hovering over it, with discordant cries and flutter of white wings, a host of seabirds. The huer runs to his hut and takes from a nail one of the long speaking-trumpets through which he gives the summons to prepare. Was never call more welcome! The sleepers below are awakened as by an electric shock, and rush to their boats; the seiners bend to the oars, watching meantime, as they pull, the lonely huer. 'Heva! Heva!' resounds through the narrow streets of the little town; and with wild shrill cries of excited women and children, and hoarse shouts of men, the crowds throng to the beach. 'Heva! Heva!' is the cry of the people.

'What has happened?' asks the visitor, astonished, and somewhat alarmed. 'Is it fire? a wreck?'

'Heva! Heva!' is the only answer; and he also hurries to the cliff, but is warned away from the huer. Yes, there the latter stands, the observed of all observers, swaying in either hand a bush, cut from the neighbouring gorse or heather. The pale faces of an eager crowd are watching him from below; but the cries and shouting are hushed. Nothing is heard now but the measured

pulsings of the tide, and the mingled cries and clamour of the cloud of white-winged birds, as they momentarily dash into the sea and bear away their glittering prey. The pilchard army heads for the bay; the red streak lengthens and widens; and as the huge school comes closer in, one may hear the rush as of a mighty wind, and see the ripples caused by millions of fins.

Meantime, the great seine has been shot; the 'folyer' attaches the second seine; the 'blowers' make fast the ropes ashore; and the pent-up feelings of the excited crowd on the cliff and beach break forth into one long loud cry of delight; for with them, too, their 'bread is on the waters.' Then commences the operation of 'tucking'—that is, putting a deeper net within the seine, thus entirely surrounding the shoal beneath and around. As the seine is now close inshore, the pilchards can be taken out at leisure. Baskets, buckets, or any convenient receptacles, are utilised for the purpose of lading out the fish into the boats; and women and children are all employed in cleaning, salting, and stowing away the fish in bulk in the cellars. On the occasion we have attempted to describe, when six thousand hogsheds were secured in one seine, the fish were valued at eighteen thousand pounds; and reckoning the number of pilchards in a hogshedd at two thousand five hundred, we have the astounding total of fifteen million fish! A simple computation will show that to count this number at the rate of five a second would take a person very nearly seventy days of twelve hours each. Pilchards, for which there seems to be no sale in England except when fresh, are shipped to various Mediterranean ports, Italy being the largest customer.

### PRISONERS OF WAR.

ABOUT nine miles south of Edinburgh, on the main road to Peebles, and under the shadow of the Pentland Hills, stands the village of Penicuik, for the most part built on the high ground overlooking and sloping down to the valley of the North Esk. Passing through the village and down the slope leading to the bridge that spans the Esk and continues the road, we turn sharply to the left just at the bridge; and a short distance below are the extensive paper-mills of Messrs Alexander Cowan and Sons, called the Valleyfield paper-mills. In the early part of the century, Valleyfield mills were sold to the government for the purpose of being used as a depot for the reception of French prisoners, the large number of whom, taken in the Peninsular and other wars, necessitating extra provision being made for their accommodation in various parts of the kingdom. And here we may remark, although it will be readily understood, that the mills have undergone very extensive alterations and additions since they were repurchased from the government and again turned to their original purpose; but certain portions of them are still very much in the same condition as they were when occupied as a military prison. These portions are still pointed out to the visitor, as is also the spot in which those who died during their captivity were buried.

'Did many deaths occur among them?' we asked, on the occasion of a visit to the place.

'Yes; several hundreds; and there is a monument erected to their memory, recording the fact, within the grounds of Valleyfield House.—For many years,' went on our informant, 'a respectably dressed stranger used to pay it a visit once a year, always on a certain day, and generally early in the forenoon. Bringing his luncheon with him, he spent the day sitting beside the monument in silence. As evening drew on, he would take a parting look around, and then slowly disappear. Who he was, or why he came, no one knew.'

'And does he still come?' we eagerly asked, touched by this remarkable proof of a love stronger than death.

'No,' replied our guide. 'For some eight or nine years he has not appeared here, and the conclusion is that he has joined those whose memory he so fondly cherished while here.'

After listening to this simple but touching incident, we expressed a wish to see the monument, a wish that was cheerfully complied with. When it became apparent that we were deeply interested in this tribute of respect to those who died strangers in a strange land, and, by the force of circumstances, enemies to those among whom they died, much additional information was given us respecting it.

It was meet that those deprived of the last offices of friendship by the exigencies of war should not be allowed to lie unknown and unnoticed in a foreign land. And yet, how often has this been the case. It was not so here, however; for loving hearts, moved by the promptings of a sympathy which makes all the world kin, have given expression to their feelings in a manner as honouring to them as to those whose memory they intended to perpetuate. The thought recurred to us again and again: What brought this stranger year after year to revisit this spot? Was he a son mourning for the loss of a father, a brother for the companion of his childhood, or a comrade for one whose soul had become knit to his as Jonathan's to David? It must have been no ordinary influence that, magnet-like, drew him hither year after year as long as life and strength remained.

Standing before the memorial itself, we felt our interest in no way diminished by the great taste and tenderness displayed in the inscriptions. On the side facing the burial-place of the prisoners is an inscription in English to the effect that it was erected in 1830, to the memory of three hundred and nine prisoners of war who died between the years 1811 and 1814—an extraordinarily high death-rate. Underneath this is a quotation from the Italian poet Zannazarius, in which are embodied two beautiful thoughts, singularly appropriate to those who sleep below far from their native land, and of which the following is an almost literal translation:

Rest in one's native land is sweet;  
But for a tomb, all earth is meet.

Sir Walter Scott, who, it may be mentioned, selected the quotation, gave the following free rendering of it:

Rest in fair France 'twas vain for them to crave;  
A cold and hostile clime affords a grave.

The phrase 'cold and hostile' was not considered

altogether in keeping with the spirit of the memorial, and the translation was not inscribed upon it.

On the other side there is a similar inscription in French; but the writer, evidently in sympathy with those who at the call of their country died exiles, studiously avoids any reference to their nationality, and styles them simply 'prisoners of war.' This considerateness has not escaped the notice and appreciation of their countrymen; for, not long before our visit, two French gentlemen, who were visiting the mills, were shown the memorial. Standing before it with heads uncovered, and reading in their own language the phrase referred to, one remarked to his friend, with evident emotion: 'They have not insulted us.—Prisoners of war—not French. Very good.' It was not always so; 'Vae victis!' (Woe to the vanquished!) being of old the only regret expressed towards those against whom the fortunes of war had turned.

Beneath, is a verse in the same language, which we were inclined to attribute to Lamartine, but which we learned was from the gifted pen of the late Alexander Cowan, Writer to the Signet. Graphically and with true pathos, it tells the life's story of these unfortunate victims of war, as will be seen from the following paraphrase:

Born to bless the vows of mothers  
Growing old,  
Called away by fate, life's story  
Soon is told.  
Lovers, and in turn the loved ones—  
Still more dear—  
Husbands, fathers. Sad the ending—  
Exiles drear.

Long after the mills had ceased to be used as a military prison, and again resounded with the sounds of busy labour instead of the sighs of the captives, a member of the firm was sojourning in France. Paying a visit to a large military hospital akin to our own Chelsea, he got into conversation with one of the inmates who had seen service in his time, and discovered that, many years before, he had been in Scotland.

'How came you there?' he asked of the old soldier.—'As a prisoner of war, monsieur,' replied the veteran in broken English.

'And where were you taken prisoner, may I ask?'—'Waterloo,' was the brief rejoinder.

'Yes. And where were you taken after that?'—'Plymouth.'

'Yes. And where then?'—'To Leith.'

'Yes. And after that?'—'Into the country, monsieur.'

'Yes. And what part?'—'Valleyfield.'

'Ah! Valleyfield?' was uttered in surprise. 'I come from Valleyfield.'—'Ah, monsieur,' replied the old man in sorrowful tones, 'very cold country; no vines—large cabbages.'

The cold of our northern clime had evidently made a lasting impression upon him, especially when taken into conjunction with the loss of his *vin ordinaire*.

On being told that a monument had been erected at Valleyfield to the memory of his countrymen who had died in exile, a tear glistened in the old man's eyes, and he was deeply affected.

'Would you like to have a sketch of it?'—'Ah, yes, monsieur—very much.'

The sketch was accordingly sent; and a year or two afterwards, on a second visit to the same hospital, it was seen suspended in a conspicuous place in the veteran's little room.

## ETRUSCAN RELICS.

In a recent Italian newspaper there is an interesting account of excavations and discoveries in the Tuscan Maremma, conducted by Dottore Isidore Falchi. The site of a once famous city, Vetulonia, has been identified, and many curious relics of an ancient civilisation have been brought to light—amongst other things, a vase bearing a curious inscription in the language of ancient Etruria. This account brought to our mind certain notes taken at Volterra, a few years back, which may interest those persons who are curious to know something of the history and domestic life of a highly cultivated people, and of a civilisation anterior to the foundation of Rome. Volterra may possibly excite less interest than Vetulonia, in so far that its site has never been doubted, and all trace of its early occupants has not been swept away.

Volterra lies about thirty miles north-west of Siena, but is more easily reached from Leghorn. A railway from that place to Le Saline, a small town in the plain, is met by an omnibus, which tugs the inquiring tourist up the steep and difficult hill on the top of which stands Volterra. To reach it from Siena, one must hire a carriage, and spend at least one night there. The drive amply repays the slight loss of time and possible inconvenience. Leaving Siena by the Porta Camollia, the road leads through an interesting and classical country, immortalised by Dante, till, turning off the Florentine road, we reach the thriving town of Colle, the lower part of which, with its smelting-furnaces and foundries, shows something of a nineteenth-century life one had almost forgotten in the quiet dullness of Siena. Leaving Colle, the road ascends all the way to Volterra, winding about in mazy doubles, and showing a varied and interesting panorama, and new points of view at every turn of the road. The towers of San Geminiano appear at no great distance, but vanish as we turn the next corner. At length, passing a high tower split from top to bottom by an earthquake shock, and reminding us forcibly of the volcanic nature of the soil, we sight Volterra, which we enter by the Etruscan gate. This gate is well worth minute inspection. Immense blocks of a dark-coloured stone resembling porphyry, dovetailed together without mortar, form a double arch of great thickness and solidity. The external arch is ornamented by three heads cut out of the blocks, which form what may be called the keystone and the side-points from which the arch springs. These heads are supposed to represent the tutelary divinities of the city. The heads are gracefully posed, but the features obliterated by time. Much of the old Etruscan wall still remains. It is built of irregular blocks of stone, put together without any regard to uniformity or regularity, pieced together without mortar—a truly cyclopean dry-stone dike.

The city is built on the top of a hill which rises abruptly from the plain; on the western side, it is indeed quite precipitous. A curious natural phenomenon is gradually undermining the town; much of the old wall has already fallen, and one part of the city has disappeared. A gulf has been formed by the subsidence of the soil and wall; churches, houses, and monasteries have been swallowed up.

Many old Etruscan tombs are found in the neighbourhood; but these have been for the most part stripped of their relics, which are now carefully preserved in the Museum. Two of the tombs have, however, been left for the gratification of the curious. These are outside the town, in the neighbourhood of the convent of San Girolomo, in the grounds of a pretty Italian villa, the gardener of which keeps the keys. The larger of the two tombs is in the form of a Latin cross, divided into five chambers, in which have been deposited the urns containing the ashes of the family or families to whom the tomb belonged. The most ancient of these urns consists of two hollow stones placed over each other, so that a cavity is formed in the centre, in which have been deposited the ashes of the deceased. Next we came to urns of much the same shape and size, but the stones more carefully dressed, and ornamented by geometric circles and angles designed upon them. Next followed delicately cut garlands of flowers and leaves. The urns appeared to be about a foot and a half in length, less than one high, and perhaps one foot broad. We had no means of accurately measuring them. Some of them were made of alabaster so transparent that the light of the torch could be seen behind, as if through porcelain.

But it is in the Museum of Volterra that we find the greatest number and the most remarkable of these relics. We can there see sculptured on the funeral urn the simple and homely scenes of domestic life, alike in all countries. On some may be seen the steed standing at the door, ready for a journey, while the angel of death, with outspread wings, separates the husband and wife, who have taken their last embrace. He is bound on that journey from which there is no return. The same idea is repeated in many forms, extremely touching. Sometimes it is the host who has been summoned from a feast, the banquet of life, by the winged messenger, who stands at the door. Again, it may be a vessel ready to leave the port, the sails half furled, to catch the breeze which is to speed it on its way. Nowhere is to be seen anything approaching the Death's head and crossbones with which we are familiar.

On many of the urns which appear to contain the ashes of the father and mother of the household, a kind of double statue is placed, the heads and busts tolerably well proportioned. The figures are placed in a recumbent position; the lower limbs are disproportionately contracted, reminding one of a certain style of caricature; but all idea of the grotesque vanishes before the touching expression and grace of the head and features. One might think that at last those two have met, never again to say farewell, so complete is the expression of repose. This style is much more frequent in Perugia than in Volterra,

where the sculptures appear to be of a much earlier date than in the former city.

Again, we find scenes from battle and hunting fields. The siege of Volterra is recognised by the old gateway with its three heads. The chase of the wild-boar, in all its details, from the start to the final scene, with the boar at bay, forms the ornament and story of another class of urns. Next, we come upon a change of subject, and Greek poetry is introduced, scenes from the *Iliad* and *Odyssey* being largely represented. The long necklace of beads hung round the neck of the chief figure on the urns—said to be emblematic of eternity, and to represent the sacerdotal character of the head of the house; the apple—emblem of fecundity—placed in the hands of the mother; the representation of sacrifice, and sacrificing vessels themselves, which have been preserved—all indicate a strong sense of religion, and show more than a glimmering idea of a future life.

Modern Volterra has almost a monopoly of works in alabaster, which substance is found in the quarries in the neighbourhood. The little town of Le Saline in the plain prepares the borax which, we believe, is largely exported to England. There is, besides, much to interest the tourist at Volterra. It has, like all other Tuscan towns, a medieval history of its own, with its fortress, churches, and paintings; but besides being off the beaten track, it has little accommodation for travellers, though we were tolerably lodged in one of the two inns there. Italian seems to be the only language spoken, but it is the pure Tuscan tongue, elegant and idiomatic, the *lingua madre* of Dante and St Catharine.

#### PURPLE PANSIES.

MINE is no lordly garden ground,  
With winding walks and shady trees,  
And pleasant nooks, where may be found  
Safe shelter from too keen a breeze.  
Oft have I dreamt of such a place,  
And fenced it well with tender fancies,  
And am but owner, by God's grace,  
Of just one plot of purple pansies.

Few other flowers will make their homes  
So near the busy, dusty town;  
The rose to purer dwellings roams,  
And shuns the factory chimney's frown.  
A lilac bush, across the wall  
Brings me a greeting from my neighbour's,  
When I step out at twilight fall,  
To rest me after weary labours.

I linger in my small domain,  
Or stoop to pluck some cherished flower,  
And dream myself in some cool lane,  
Quaint 'Pleasaunce,' or 'My Lady's Bower.'  
I scarcely miss the gardens fair  
Of silvan queens in old romances,  
Since I find heart's-ease for my care  
Beside my treasured purple pansies.

## STOCK EXCHANGE SPECULATION.

It is to William III. that we are indebted for the foundation of the Bank of England, and to him we may also ascribe the creation, indirectly, of the Stock Exchange. When he granted the Bank Charter, and by so doing imposed upon the nation a national debt, or as others would call it, a national incubus, he unconsciously provided a foundation for that extensive system of speculation which is the lifeblood of the Stock Exchange. Not that he can justly be charged with having initiated the practice of relieving the exigences of the state by means of loans, for his predecessors had been quite as ready as he to make use of that expedient; but he did inaugurate a principle in raising his loans which had been steadily ignored by all previous monarchs. William wanted money, and willingly acknowledged the debt he incurred when the money was placed at his disposal, pledging the faith of the state that the interest should be paid regularly and promptly; whilst his predecessors, who borrowed largely and often, not only refused to pay interest, but also repudiated all the pledges and promises by means of which the money had been obtained. William, when he ascended the throne, acknowledged the debt incurred by his immediate predecessors, and included it in the national debt which he created when he granted the Bank of England charter. However opinions may differ as to the means he adopted for restoring the public credit, William deserves all praise for the honest determination he manifested that thenceforth the state should always meet its obligations.

In a few years after his accession, all the various modes of borrowing practised on the continent had found a firm footing in England. The Royal Exchange, intended originally for more purely commercial transactions, became the scene of speculations in short and long annuities, ton-tines, lotteries, and the stock of the famous East India Companies. Within its walls were to be found men of all ranks and nationalities, all

eager to grow rich by the easy and fascinating devices then for the first time placed within their reach. There might be seen a wily Jew trying to beat the calm, dignified Quaker; further on were to be seen an impetuous Frenchman and a stolid Dutchman striving to make a bargain; here was a courtly Spaniard, there a grave dignified Turk in his flowing robes, mingled with enterprising Flemings, cautious Scots, and earnest Venetians. Thither came the courtier to turn to profitable account the knowledge he possessed. Ministers, judges, clergymen were all attracted by the new source of wealth opened out to them. It is not strange to find that even the steady, persevering trader, who had been accustomed to increase his wealth and prosperity by enterprises and adventures surrounded by no little risk and peril, was induced, by the fabulous stories circulated of fortunes so easily won, to divert a portion of his capital from his business in order to engage in speculations of which he heard so much.

All the tricks and stratagems now prevalent in the stock market were well understood and largely employed even at that early date. Many of the terms used in connection with Stock Exchange operations originated in the speculations in the funds of the East India Company. Speculators displayed the same ingenuity and skill that they do now in the fabrication of false news. If it is possible for a clever speculator at the present time to cause prices to rise or fall thirty or fifty per cent., those early gamblers could not have had much to learn when they knew how to cause a fluctuation of two hundred and sixty-three per cent. in East India stock. The well-stored ships had been overtaken by a hurricane; they had struck on rocks or quicksands, of whose existence none had been previously aware; or they had been captured by the enemy or by pirates. Naturally, while many won, a larger number lost, and complaints began to be frequent against the 'jobbers'—a term originally applied ignominiously—who polluted the Royal Exchange by their presence. 'They can ruin men silently,' said a writer at the

time, 'undermine and impoverish, fiddle them out of their money by the strange, unheard-of engines of interest, discount, transfers, tallies, debentures, shares, projects, and who knows what of figures and hard names.' The public feeling at length took the form of a law which limited the number of brokers and contained some strong enactments directed against them.

Wearying at length of the objections and innuendoes by which they were assailed, the brokers and jobbers resolved to abandon the Royal Exchange for the 'Change Alley, a large unoccupied space, where they thought they could carry on their extensive operations free from molestation and annoyance. This movement was all the more necessary owing to the ever increasing number of speculators. But it was not long before the inclemency and fickleness of the English weather drove the brokers from the open unsheltered Alley to take refuge in *Jonathan's* coffee-house, which thus became the resort of speculators and jobbers, just as *Lloyd's* was of insurance companies and underwriters. Finding the brokers and speculators flocking together under the hospitable roof of *Jonathan's*, the City took alarm. The City magnates resented the desertion of their time-honoured Exchange, and tried to force the offending brokers to return. Their efforts were vain. The brokers gathered where money and commissions were to be made; they remained true in their adherence to the Alley and *Jonathan's*.

On July 15, 1773, the brokers determined to give the distinctive and appropriate title of the Stock Exchange to their quarters in *Jonathan's*. They then collected sixpence each, says the newspaper, and christened the house with punch. The new title soon became popular; and familiar as had been 'the Alley' and *Jonathan's*, they were soon discarded for one which indicated so clearly the character of the temple of speculation. There was one great drawback to these premises: the coffee-house was open to all who cared to frequent it, whether for business or refreshment. There was no privacy about it; the brokers and jobbers pursued their dealings in the midst of the speculating public; knave, rogue, and saint all jostled against each other; Jew met Gentile; Turk met Greek; and the light-fingered pickpocket enriched himself at the expense of all. The conviction gradually forced itself upon the brokers and jobbers that so wealthy and influential a body ought to own premises of their own, where they could pursue their calling in secret and unrestrained by the public eye. Accordingly, at the beginning of this century, funds were collected for the purpose of acquiring a suitable site in the vicinity of the Bank. So liberal were the contributions, that on the 18th of May 1801 the first stone was laid of the present building, exclusively devoted to stockbrokers and dealers. Such is a brief outline of the history of a building whose name is known and whose influence is felt from one corner of the earth to the other.

The existence of the Stock Exchange, now that the national debt of this country has attained such enormous proportions, is unavoidable. The humble patriot who has placed his money at the

disposal of the government, confident that he will receive the interest on his investment with certainty, is often compelled by circumstances to withdraw his capital to relieve his pressing necessities. Without the Stock Exchange, he would experience great difficulty in finding a person willing to take his place as a creditor of the state; but on the money market he can at all times find buyers ready to purchase his funds. To honest investors, the Stock Exchange is an undoubted boon; but it is doubtful whether its influence on the morals and manners of the public is equally beneficial, owing to the gambling and thirst for speculation which it promotes. Speculation to a certain degree is inseparable from all commercial pursuits, and is conducive to the prosperity and wealth of a country so long as it fosters and encourages enterprise on the part of its traders. Every commercial adventure is more or less dependent on the principles of speculation for its success or failure. It is this healthy degree of speculation that prevents business pursuits from becoming tame and dull, and imparts to them that interest and attraction in which business men find their chief pleasure. So long as painstaking and persevering industry, by means of which the prosperity and welfare of a country are promoted, receives a healthy impetus from speculation, there can be no objection to it on the ground of the evil consequences it produces; but when the narrow limits to its good effects are passed, there can be no question that speculation is one of the most pernicious and deplorable modes of gaining wealth.

The benefits of Stock Exchange speculation or gambling are nil; the evils, many. The wealth of the country is not increased by it; the morals of those engaged are blunted; time is misspent; the mind is perverted from praiseworthy to mean objects, as the practice of gambling fosters an inclination to abandon all honest occupations for those which are at once dishonest and disreputable. When once ensnared by the seductive charms of gambling, the poor victim is enticed into a path leading to ruin, if not to crime, and from which he is powerless to extricate himself. The mania which at times seizes the public and leads it into speculations in stocks and shares is nothing but gambling, called by a more plausible and taking name. The effects of speculating on the Stock Exchange are as prejudicial to the morals of the community as those of ordinary gambling; but whilst the law looks with a severe eye on gambling pure and simple, it turns an indulgent glance upon the practices prevalent on the Stock Exchange. The fact is, Stock Exchange speculations are a more or less privileged sort of gambling. The operations are for the most part in government funds, for the creation of which the state has been responsible, so that it is hardly to be expected that the state will step forward to repress or discountenance transactions in the commodities they have created. Given an inch, speculators took an ell, and gambling is carried on in stocks and shares with every possible facility.

Nothing can illustrate more clearly the unscrupulousness and absence of honest principles amongst the majority of habitual speculators and frequenters of *Capel Court* than the frequent hoaxes, unfounded rumours, and systematic mis-

representations that are indulged in there. How fatal they have proved to the hopes and prospects of many respectable men, the annals of the Stock Exchange prove. Our readers will remember the frauds recently exposed of Blake-way and Davis; but these are by no means rare cases. A list of those who have participated in Stock Exchange frauds would make a lengthy document, and would embrace all sorts and conditions of men, from ambassadors down to brokers' clerks. Conspicuous in this infamous list would be found the names of Fordyce the banker, Daniels the stockbroker, and Benjamin Walsh, M.P.

We cannot conclude this article without giving a passing glance at the manners that prevail on the Stock Exchange. The eager scrambling after wealth which engrosses the thoughts and attention of the members, besides proving baneful to their morals, has also a marked effect upon their manners. The scene within its walls, even in quiet times, is one of endless uproar and confusion. On all sides are to be heard the shouts and wrangling of the buyers and sellers, each striving to beat his fellow in making the bargains. Everywhere are to be seen brokers hurrying to and fro, and their clerks rushing in and out at headlong speed, in order to take advantage of the momentary fluctuations in prices. In times of excitement or panic, all this confusion and uproar is magnified tenfold. A stranger, ignorant of the character of the building, would never guess that it was a place of business where some of the most gigantic transactions were effected in a few minutes. The noise and confused babel of sounds would strike him as more in keeping with a bear-garden than with the recognised mart for funds and stocks. A stranger, however, has but a slight chance of witnessing the scene within the walls of the Stock Exchange. If by any chance he does find admission within its sacred precincts, his stay would certainly be of short duration; whilst his experiences gained during his intrusion would in all probability be none of the most agreeable.

Mr Francis tells the following amusing story of a gentleman who found his way into the Stock Exchange, and of the consequences attending his short visit. 'Not long ago, a friend of my own, ignorant of the rule so rigidly enforced for the expulsion of strangers, chanced to drop in, as he phrased it, to the Stock Exchange. He walked about for nearly a minute without being discovered to be an intruder, indulging in surprise at finding that the greatest uproar and frolic prevailed in a place in which he expected there would be nothing but order and decorum. All at once, a person who had just concluded a hasty but severe scrutiny of his features, shouted at the full stretch of his voice: "Fourteen hundred." Then a bevy of the gentlemen of the house surrounded him. "Will you purchase any new navy five per cents, sir?" said one eagerly, looking him in the face. "I am not"—— The stranger was about to say he was not going to purchase stock of any kind, but was prevented finishing his sentence by his hat being, through a powerful application of some one's hand to its crown, not only forced over his eyes but over his mouth also. Before he had time to recover from the stupefaction into which the suddenness and violence of the eclipse threw him, he was seized

by the shoulders, and wheeled about as if he had been a revolving machine. He was then pushed about from one person to another, as if he had been the effigy of some human being, instead of a human being himself. After tossing and hustling him about in the roughest possible manner, denuding his coat of one of its tails, and tearing into fragments other parts of his wardrobe, they carried him to the door, where, after depositing him on his feet, they left him to recover his lost senses at his leisure.'

## RICHARD CABLE,

### THE LIGHTSHIPMAN.

#### CHAPTER XXXII.—BENEATH THE EVERLASTINGS.

THE night had closed in, and still Josephine sat on the overturned cradle. The tears had dried up; but she continued to occupy the same place, holding Richard's handkerchief clasped in both her hands on her lap, looking straight before her, into vacancy—lost in thought. A soft, yellowish-gray light filled the little window; but within the cottage kitchen all was dark, or at best was in deep twilight. Josephine had not moved for an hour. Her face was away from the window, in complete shadow. All at once a flash fell on her. She looked heavily up, with half-consciousness, to see her father and the rector before her.

'I knew she would be here,' said the latter.

'I did not suppose her such a fool,' muttered Mr Cornellis.

'Then you see I knew her best,' said the rector. —'Josephine.' He put out his hand, and she listlessly put her own into it. She liked and trusted Mr Sellwood, who had known her from infancy.

'My dear child,' he said, 'your hand is cold and wet.'

'I have been crying,' she answered simply.

'You must need your dinner,' said her father.

'We have put it off, and off, awaiting you, and the soles will be burned to chips.'

She said nothing in reply to her father; but her fingers closed on the rector's hand, as he was withdrawing it. 'I want to speak to you, Mr Sellwood—alone,' she said. 'Would you mind remaining here with me a little while?'

'But, Josephine,' said her father, 'dinner is spoiling; consider the soles.'

'Please, go home, papa, and eat the soles. I will not detain you. The matter about which I wish to speak is one I desire to speak about to the rector alone.'

Mr Cornellis considered for a moment. Josephine was fretting at the departure of her husband. Girls never know their own minds. It was perhaps natural that she should feel for a while his sudden disappearance. In a day or two, this chagrin would pass and the sense of relief prevail. It might relieve Josephine's mind to talk the affair over with Mr Sellwood; it could do no possible harm. She was a girl who acted on her own impulses, and took no advice which did not agree with her own wishes. The rector might, and probably would advise that she should open communication with Richard

Cable and urge him to return. This evening, she might agree with him; to-morrow, she would come to a better mind.

Mr Cornelis shrugged his shoulders. 'I will leave the lantern with you,' he said, 'to help and lighten your consultation.'

When he was gone, the rector set the lantern on the floor, and said: 'Well, Josephine, you want my advice?'

'O no, Mr Sellwood. I have made up my mind. I want you to tell me how I can carry out my own intentions.'

'Well done, young woman; this is frankly put. It is not always that your sex is so outspoken. They ask advice, and follow it only if agreeable to their own fancies.'

'I want to tell you everything, rector,' she said. 'I have acted very foolishly—I mean very wrongly. I have worked a vast amount of mischief; and now, I have been trying to find out how I may undo it.'

'What have you done? Tell me that first; and secondly, what you are going to do to mend it. Then I will give you my advice.'

'I do not ask your advice.'

'Oh! I beg pardon; I forgot,' said the old parson, somewhat testily. 'But I will not lend my hand to any star-scraping, scatter-brained scheme. You may not seek my advice; you may not value it; but the experience of a man of over sixty is worth something.'

'Indeed, indeed, dear Mr Sellwood, I value your opinion, your advice, most highly; but this is a case in which I must decide for myself. I have done one wrong after another, an injustice in ignorance, a wrong wilfully; and it appears to me clear as the day that I, and I alone, can work out my course for the future so as to amend the mischief. If you approve, I am very glad; but if not, I cannot help it. I must go my own way, or sin against my conscience. I know very well that my father will not approve; he and I see everything differently; and Aunt Judith will be indignant, and call my conduct wicked because it is not commonplace.'

'Never mind about Aunt Judith—you are too severe.'

'Mr Sellwood,' said Josephine, 'would you mind sitting on the table, whilst I talk to you?'

'I will sit anywhere, my dear, to please you, anywhere but in a bishop's throne, and that—not for any one.'

'Then I will remain here on poor little Bessie's cradle, at your feet.'

'But not in a child-like spirit and in the mental attitude of a disciple, you headstrong piece of goods. You have made up your mind—to what, pray? How long have you taken forming it? A solid judgment is a first requisite in the making-up of minds, and that—excuse me—you lack.'

'I have been very unhappy. I have cried till I have wet dear Richard's handkerchief through.'

'So at last there is some community established between you. Both use the same pocket-handkerchief.'

'Mr Sellwood, I will tell you everything; but please not to interrupt me in my story.'

The rector, who loved to hear his own voice,

was nettled. 'I am to pass no comments, as I am to tender no advice. Well, I will do my best; but I cannot promise silence.'

'And yet you expect us to sit quiet when you preach, whether we agree with you or not.'

The rector winced. 'Go on,' he said. 'After that, I must be silent.'

Then she told him the whole story of Gabriel Gotham and Bessie, as she had heard it from her aunt; and it filled the rector with astonishment. He had not heard anything of it before. 'Bless me!' he exclaimed, 'Mrs Cable is a wonderful woman to keep her mouth shut—proud, proud as a queen.'

'A noble pride,' said Josephine.

'Yes,' he said. 'I admit the correction—a proud-hearted woman, a grand woman; there are not many like her.'

Then Josephine told him how she had only come to a knowledge of this a few hours ago.

'And already made up your mind upon it!' exclaimed the parson. He could not refrain from making his comments.

'Mr Sellwood,' Josephine went on—she withdrew her hand from his, and folded her arms over her bosom, but did not let go her hold of the blue handkerchief—'Mr Sellwood, I have acted very wickedly. I daresay I acted without a wise discretion in marrying Richard. I was not in love with him.'

'Then why in the world did you marry him? That was your sole excuse for committing an act of folly, and you have cast it from you.'

'It was this which drove me to it. Papa was so disagreeable with me about him—he said such things that I was angry, and became defiant. Aunt Judith was stupid, as she always is, and I felt an inclination to fly in her face and thoroughly shock her. Then I got into that awkward predicament on the seawall at midnight, when you and Captain Sellwood came upon me with Richard. After that, matters were complicated by Cousin Gotham. I believe he did it purposely. He gave Richard the boat—in my name, and had the boat called by my name, and encouraged talk in the place about me and Richard, which made me very uncomfortable, and my father very angry; and I did not see how I could get out of the hobble, into which I had been partly thrust and had partly slipped, in any other way. I was nearly mad with annoyance and wounded vanity and irritated self-will. But that was not all. I saw that Richard was so natural, open, good, and true, and I felt so utterly at a loss where to look for a guide.—My father!—'

'Never mind about your father.'

'I could not follow his advice; and I did not feel that I was secure in my own opinion of right and wrong. I suppose all women look for some one to whom to cling.'

'My advice you never thought of asking for,' said the rector in a tone fraught with mortified pride. 'You seek me only to tell you how you may be enabled to follow your own whims without inconvenience.'

'Do not be cross with me, Mr Sellwood,' pleaded Josephine. 'I cannot explain to you exactly how I was situated at home; somehow, papa and I never had much in common, and we did not share confidences. I was driven to battle

out my own way, sometimes going wrong, and sometimes right.'

'Many times wrong, and sometimes right,' suggested the rector.

'Possibly so.' She paused, considered, and then said: 'No; I do not think it. When I have gone wrong, I have been influenced from without. As for marrying Richard—that was not wrong, except in Aunt Judith's table of commandments, in which all that is not usual is wrong. No'—she spoke with the earnestness of sincerity—'I really believe that the prevailing thought in me was that in Richard I should find an ideal man of truth and honour, and that is why I took him.'

'Mercy on me!' exclaimed the rector. 'Because a man can drive a donkey-cart, that does not qualify him to drive a locomotive! Richard was all very well in his own sphere; but you transferred him to one he knew nothing about, in which he could not possibly assist you.'

'I see that clearly enough now,' said Josephine humbly. 'I did not see it till too late; and then, when I became aware of it, I got impatient with him; I lost my temper, because he could not accommodate himself immediately to his new position. I exacted of him the impossible.'

'To be sure you did.'

'I made no allowances for him. I was irritated, and spoke rudely, insultingly to him. I even ridiculed this dear old blue handkerchief, which—the tears began to trickle down her cheeks again—which is now wet with my contrite tears.'

The kind old rector took her hand and patted it between his own. 'My dear,' he said, 'all will come right in the end, now; you have begun at the right end, with repentance.'

'But he is gone away, gone with all his children and his mother without even saying a good-bye. I have driven him out of his home. That is not all. You know his story now; you see that the Hall and the manor ought in common fairness to be his. What an injustice, what a wicked injustice I have done him!'

'I am glad you acknowledge your faults, Josephine; that is the first step towards making all well again.'

'This is nothing like all I have done, rector. I have spoiled the goodness that was in Richard. I have made him morose, bitter, and mistrustful. Even that is not all. It was through my fault that the poor little child was hurt. I had so angered him, that when he went to the *Anchor*, he drank too much, and then—'

'Yes—I know the rest.' Mr Sellwood said no more. For once, he was silent. He was touched by the self-accusation of the girl, and he did not know, for once also, what to advise.

'Richard was so gentle, so full of thought for others, and pity for those who suffered in any way, so helpful to all who were weak; and now he is quite changed. He is sullen at one moment, fierce at the next. He no longer loves me—he told me so; and I know, I do know that only a little while ago he loved me with his whole honest, noble heart. He has torn up my picture and thrown it among the ashes.'

'He cannot tear you out of his memory.'

'But he can remember me only as the murderer of his happiness, as the person who

mained his child; he can remember me only as an offender who is past being forgiven.'

'I do not think it,' said the rector. 'Love is not killed so quickly. It may sink into the ground and disappear, like a spring in drought; but it will break up again, and flow as before.'

'No, Mr Sellwood; he will never love me again till I am quite changed from what I have been. I have been sitting here for a long time—how long, I do not know, considering what is to be done. Things must not remain as they are.'

'Exactly; and if you ask my advice'—

'I do not. I have made up my mind.'

'I beg your pardon; I forgot.' He was a little huffed, and took away his hand from Josephine.

'Do not let me go,' she pleaded. 'I do not want to offend you. I have no one else to whom I can open my heart.'

He took her hand again and pressed it, in assurance of his regard.

'Well, Mr Sellwood, I have been turning the whole miserable muddle out, and arranging my thoughts and putting them in order, just as Richard would tidy everything into its proper place. There are a lot of things mixed together, and these I have sorted into their several lockers. First come Cousin Gotham's money and estate. I have no right to them. They belong in all fairness to Richard; that I see clearly; so I will have nothing more to do with them.'

The rector started.

'Tell me,' she asked—'tell me, frankly, what you think?'

'In law'—

'That is like my Aunt Judith. Because Cousin Gotham was five hours short of his legal time in Scotland, therefore what is wrong is right.'

'It is you now, Josephine, who interrupt. By law, you have a perfect, unassailable right to everything left by Mr Gotham. Whether you are justified in accepting and keeping his bequest, under the circumstances, morally and in honour, is another matter.'

'There! there!' she exclaimed almost exultantly. 'You see I riddled out that conundrum right. The property belongs to Richard. He shall have it. I will not touch a penny of it more.'

'But what of your father?'

'My father must manage for himself. I see my course plain before me. I go straight my own way, and put wax in my ears, so as not to hear any voice from outside, however sweetly singing.'

'Go on, then.—What next?'

'In the next place, I acknowledge that I did wrong in requiring Richard to shape himself to fit a position for which he was unsuited.'

'Right again,' said the rector.

'At his age, it is not possible for him to adapt himself, in every external, to what is required of him. In heart and mind, rector—oh, he is the truest gentleman! a Bayard, *sans peur et sans reproche*.'

Mr Sellwood smiled at her enthusiasm.

'It would have been different, had he been quite a young man; but he is past the age when all the mental bones are flexible,' said Josephine.

'I do not know that—with patience and in time.'—

'No, rector; he must not again be subjected to the restraint and torture. He must be allowed to go his own simple way, unhampered by artificial checks and untaxed by conventional regulations.'

'Then what do you propose?'

'If we are to be reconciled, if he is ever to be happy with me, the disparity between us must disappear.'

'But how? You have just said he is too old to learn our social habits.'

'Precisely; but I can go down to his level.'

'My dear!—What do you mean?'

'Do you not see that the only chance of our living happily together is for us to be on an equal footing? He has tried my level, and cannot sustain himself on it. I must take his.'

'That is not practicable.'

'Pardon me—it is. Do you not see that one step in this course I have mapped out leads to another? I have said that I will not have his money; therefore, I have nothing of my own. What I had, has been dissipated. I have not a penny. What must I do, then? I must earn my livelihood.'

'Good gracious, Josephine!' The rector sprang from the table on which he had been seated.

'I must learn to think and feel and see things as Richard does, through eyes on the same plane as his—so only shall we be able to understand each other. That is not all. He is very angry with me now, and nothing else that I can do will convince him of my repentance and of my desire for reconciliation.'

'Earn your living! Goodness gracious me!'

'All fits together perfectly, rector. I shall earn his esteem at the same time that I am acquiring the modes of thought and habits of a lower grade in life.'

'Upon my word!' exclaimed Mr Sellwood, 'you are a person who always rushes into extremes.' He was astonished beyond measure.

'Extreme measures alone suit the occasion,' answered Josephine. 'As I utterly renounce my claim on the property, I can do no other than earn my bread, and by so doing I gain my chief end.'

'But how will you earn your bread?'

'I will go into service. His first wife was a maid in your house, and he was happy with her.'

'You must not do this—it will be degradation.'

'I must do it. It will be no degradation, morally, for I have a right end in view.'

The rector was greatly shaken. 'I would never have advised this; I would never have thought of this.'

'I knew that; therefore, I did not ask your advice.'

Mr Sellwood remained silent. He could not grasp her bold proposal all at once. Josephine waited. She had become calm as she spoke of her resolution. She waited for him to say something. Presently, he said in a choking voice: 'I retract what I let fall just now. There will be, there can be no degradation. On the contrary, there will be a rise of your better self. My dear, this is very wonderful to me. Your

female instinct is a better guide than my masculine sense. I should never have thought of this. Even now, I cannot say whether it commends itself to my reason; to my heart, it does at once, at once!' He was much moved. 'Josephine, in such a daring venture, guidance and help are needed.' Then he paused again. Presently he went on: 'Josephine, perhaps you have read that, in old times, pearls were found in the Severn, and British pearls were much esteemed. Do you know how they were found? Horses and cattle were driven across the fords in the Severn, and they trampled on, bruised, and broke the mussel shells that lay there; then the crushed mussels in their pain exuded the matter that formed the pearls. Now that bridges have been built to span the Severn, no more pearls are found in it; for, though there are mussels still in the shallow water, they remain only mussels; they produce no longer pearls, because no longer bruised and broken.—My dear Josephine, I think—I believe, that the pearl of a nobler and a truer life is beginning to grow in you, because the feet are passing over you and treading you down.'

'Rector,' said Josephine after a long silence, 'what are you looking at above me—the everlasting?'

He paused, he did not answer at once, he recovered himself slowly, and said softly: 'The Everlasting! Yes.'

(To be continued.)

#### SOME NOTES ABOUT BIRDS.

ANYTHING connected with what a lady friend calls 'the unnatural instinct of the cuckoo' is always of interest to lovers of nature. On the first of June, a friend of ours, in company with two other gentlemen, visited what he called 'a cuckoo's nest,' having an opportunity, rarely vouchsafed, of seeing the 'unnatural instinct' at work in a very young bird. The young cuckoo had been hatched only the previous day in the nest of a meadow-pipit, better known in Scotland as a moss-cheeper, a bird which the cuckoo frequently favours with the rearing of her young. The unconscious interloper, one day old, blind, and without a vestige of feathering, had already ousted one of the moss-cheeper's eggs, which lay outside the nest. Sitting down to chat for a few minutes by the nest, one gentleman called the attention of the others to the young bird, which seemed to have taken a fit. It wriggled about in strange contortions, twisting its head about under its body, as though at times it were trying to stand on its head, with its long neck worming about. Ere they well knew what to make of the helpless-looking thing in its struggles, it was seen to have one of the eggs in the bend of its eel-like neck against the side of the nest; and the next moment the hind quarter of the bird was under it, and the egg lodged in the hollow of the interloper's back (which is said to be specially fitted to receive it). Then, with its head still bored underneath, the little callow usurper began to wriggle itself backward in strange fashion until from the verge

of the nest the egg was wriggled off. Having backed to the upper side of the nest, and that being on a level with the ground above, the egg could not roll away, but fell back into the nest, the young cuckoo rolling to the bottom of the nest at the same time, where it lay prostrate, and seemingly exhausted, till the visitors left. On the recovery of its strength, doubtless it accomplished its object by repeated efforts; as, when we revisited the nest some days afterwards, it contained only the young cuckoo.

It is said, 'dog will not eat dog;' the rook, however, when put to a pinch, seems to come near breaking this rule; at least, we once saw a pair of them almost devour a starling, which is nearly allied to the Crow family. In the winter of 1879, when a deep snow lay on the ground, our attention was drawn to the frightful screeching of a bird. Hastening to the door, we saw a pair of rooks pursuing a starling, which they knocked down in the snow several times, and had at last set about devouring, when they were driven off. The poor starling, however, was helplessly maimed.

It is not generally known that woodcocks breed regularly in many parts of Britain, particularly in Scotland. Wherever they breed, they may be seen nightly, from February till June, flitting along the tops of the woods for an hour or two after twilight sets in. Their peculiar call, which a writer has well translated 'Vyssop,' is uttered at rather regular intervals all the time only of its flight, with a low 'Churr,' 'Churr' between each call. These flights are steadily kept up, back and forth across the woods, like a bird in pursuit of prey on the wing; and it is hard to imagine how such an industrious, business-like flight is kept up, unless something is to be gained thereby; yet the bill of the woodcock seems quite unfitted for preying upon insects on the wing.

The persistence with which many birds cling to their nesting-grounds is remarkable. Rookeries which have been ruthlessly shot over year after year are resolutely resorted to by the same birds, though in such cases there is a tendency in the birds to build their nests more scattered throughout the wood. This is even more marked when the eggs are frequently taken by boys, the nests being then placed on higher and more slender branches—doubtless a great deal more care being required in the erection of the structure on such slender foundations, and it is wonderful how rooks lay the dry sticks in such positions to 'bide the blasts.'

In a rookery in our neighbourhood which had been little disturbed for a number of years, there was a marked moving of households five years ago, the young birds having been decimated in the previous year by the gamekeepers. The centre of this long strip of wood was then almost deserted, the nests being built towards the extremities. As this proved no security in later years, the birds have mainly gone back to their old headquarters. A prominent ash-tree at one end of this wood was taken up in the year of migration referred to, and has annually borne a great crop of crows' nests since. In a great gale in December, a large limb was torn off this tree; and there was a marked absence of crows there in the end of February, when they begin

to frequent the trees on which they build. It was near the end of the second week in March ere a bird was there seen; then four nests were built in succession, all at the farthest available points from the gap in the tree. Though there were other good building sites, the cautious rooks avoided them; and it seems probable, from their late building, that the tenants were young birds which had not learned by experience that a damaged tree is more liable to injury from wind-storms.

A pair of chimney-swallows built their nest over the inner hall-door in the writer's dwelling, the outer door being left open at night after the work began, to give the birds access in the mornings. Though the bird left its nest whenever any one passed in or out, and flew about so long as any one stood in the doorway, which not unfrequently occurred, five birds were safely hatched and fledged, the young returning to their nest for some nights after. War being declared against the birds as a nuisance by the housekeeper, and it being difficult to argue otherwise, orders were issued against another year's occupancy of the premises. In the following May, the birds were promptly on the ground, and set resolutely to work in their old quarters; and though warned off by having the outer door shut again and again in their faces, and kept so for hours each day, and always till late morning, the birds lost no opportunity, when the door was open, in building their nest for two long weeks. Even some time after that, when it seemed certain they must be nesting elsewhere, they came occasionally, as though loth to give up their loved haunt. Five successive years these birds returned, trying hard to get a reoccupancy; and when their favourite corner was gained, such a delightful love-chatter was heard as only chimney-swallows can indulge in. It seems fair evidence that the same birds have always returned, from the facts, that it is unusual for birds to enter a hall-way which is well frequented; the same corner always being chosen; and each year their efforts growing less persistent.

In the head of the rainpipe nearly over the front door of the same house, a pair of starlings have reared their brood for several years. Very unwillingly, they, too, have been proceeded against as a nuisance. For three successive years the spout-head was stuffed with dry pine branches, each year more carefully, to debar the birds; but each year, after much labour, the birds forced an entrance. In 1884, a birdhouse was erected for their convenience on an oak-tree in front of the house—which is the favourite perch of the starlings—and before nesting-time the spout-head was boarded over. The birds tried their utmost pecking powers on the board in vain, and for a day or two visited the birdhouse—which in another site had been occupied by starlings—but, contrary to the usual habits of the birds, they built their nest 'above board,' under the eaves, and as close to the old site as possible; and here a brood of young birds in early June were safely reared.

During all these years, the hen-bird has made her roost in that spout-head summer and winter. Even during severe seasons, when not a starling is to be seen in the neighbourhood, she came home nightly, and often, when passing underneath at

a late hour, we have heard her uttering her plaint in a 'Chink!' 'Chink!' as though complaining that she could not sleep for cold. One spring, her mate was shot; but in a few days she found another, and went on with her nesting, little delayed by that trifling accident, and cheerfully chattering and 'gnattering' in starling fashion.

In the rear-spout of the same house, a pair of starlings, four years ago, built their nest, and reared their young safely. Here the connecting roof-pipe is not so far continued into the spout-head, the consequence being that in heavy rain-falls this nest is flooded. For three years past the birds have been driven out by the rain; and though young birds were left drowned in the nest, the old birds rebuilt their nest within ten days, and laid their eggs over the dead. Next spring, they were driven out early, and again when the eggs were nearly hatched, one of these being found washed out on the ground underneath. Two days afterwards, these birds had taken to the birdhouse referred to, and for some ten days seemed busily nesting there; but dry weather having set in again, they returned to their old quarters, where the hen-bird again reared a brood which was also drowned.

A water-ousel, which had reared its young, little disturbed, for years on the face of moss-grown rocks overhanging by trees and their roots, has been regularly harried for the past four years by a family of boys who came to live near by, and yet every spring it came back and built in the same site. The building of their large domed nest was perhaps too great an undertaking to be renewed in the immediate face of such difficulties, and yearly, after being harried, we have observed that the birds disappear from the neighbourhood for several weeks, doubtless to some other part of the stream, to rear a second brood; yet each spring they have returned to the same spot. Last winter, the overhanging trees and roots were entirely torn away by the gales, and the birds found a new site farther along the same pool-side, where, luckily, the boys did not discover their nest.

Can it be that where a pair of birds make their first nest and rear their young safely, that there lies a first-love charm? In the case of the ousels referred to, there is every probability that in some at least of their second nestings, the protecting greenery being then so much greater, and boys ceasing to look so keenly for nests, they reared their young successfully, and yet they have regularly returned to the site which is yearly harried.

## CHECKMATED.

### CHAPTER V.—CONCLUSION.

THE excitement attendant on Geoffrey's announcement, with the tearful delight of the girls to heighten it, quite carried David out of his worry, and for the time he was as cheerful as any of them. Not but that he felt some twinges of conscience when he looked at the glowing, honest face of the young man, as he sat opposite to him at the little table and heard his plans. These were all bound up with the happiness of Josie, which he evidently placed far before his own;

and the clerk contrasted his frankness and candour with the underhand treatment he—David, the self-reproachful—had at one time made up his mind to deal out to the young fellow.

It was soon explained that the windfall which had given Geoffrey 'something like a fortune' was the result of the mining speculation of which he had told them. He had not become a millionaire; but the land had realised a sum which would go far towards making him independent; and if he obtained the promised situation, he might call himself rich.

'All through Cloudy Range Jack,' he wound up, over and over again. 'I told you he was the best fellow in the world, and he is. He felt sure that there was a great vein of gold in these deserted diggings. I knew nothing about it; and so he made my fortune. He has come back with me; he will see you in a day or two.'

'Have you found out his name yet?' asked Josie.

Geoffrey returned some jesting, evasive answer to this question, and there was an odd expression on his features as he did so. This struck David as being a little mysterious, as implying that he 'could a tale unfold' if he chose. Indeed, when the girls pressed him, he at last said he would rather leave the disclosure of Jack's name to his friend himself.

The evening was a delightful one. Geoffrey, although a temperate man, naturally indulged in a glass of grog, and in this David joined him. Under the combined influence of the spirits, his pipe, and above all, the welcome reaction in his train of thought, the clerk grew more confidential than he might otherwise have been. During an interval, when they were left by themselves, the girls being engaged in getting supper ready, he told Geoffrey all that had happened, of the present position of affairs, and of his appointment for the next day.

As he listened, the queer expression again stole over the young man's features; he seemed inclined to laugh, but checked himself, and looked at David so oddly, yet so shrewdly, that the clerk felt uncomfortable, and could scarcely refrain from asking his companion the meaning of such enigmatical glances. However, he held his peace, and the supper being brought in, he thought no more of the matter.

Next day, David was punctual to his appointment; but on nearing the office in Great St Amyott's Court, he was accosted by a man whom he recognised as one of the messengers there. 'Oh, Mr Chester,' began the man, 'Mr Gadham says, will you be so good as to go in at his private door?—This way, if you please.'

David was rather taken aback by this address, for though he had seen the man when he visited the firm, he had no idea that the messenger knew him. He followed, as desired, and found Mr Gadham in his room. The merchant looked up with a smile, and congratulated David upon his punctuality.

'As you must have guessed, Mr Chester,' he said, 'I expect my precious cousin here immediately. He comes, he supposes, to receive a cheque from me, in five figures, as a compromise in a business you understand as well as any one. It perhaps was hardly a legal proceeding; but it was decided upon in accordance with the

advice of the best lawyer of the day, who does not appear, however, in the settlement. Legal or not, my cousin will be disappointed.—Now, to mention a different subject. The more I think of your conduct, Mr Chester, the more I am pleased with it, and when this business is over, you will find me not unmindful of your interests.

David made a grateful bow, and strove to stammer out his thanks, but with no great success. The merchant smiled again as he did so, and some curious, inexplicable freak of thought associated this with the queer smile on Geoffrey's face the previous evening.

Chester could not follow up this speculation, as the messenger appeared and said two gentlemen wished to see Mr Gadham by appointment; and on the reply being given, Mr Ernest and his legal adviser were shown in.

It may be as well to state here that it had by no means been the intention of Mr Ernest to have company on this visit; but Mr Elliott, who was not remarkable among his friends for guileless simplicity, had been thinking seriously over some recent conversations held with his client. The outcome of these meditations was a resolve to attend him at the meeting with his cousin, and further, not to leave him until a satisfactory division of the expected cheque had been made. The announcement of this resolve produced a scene, which might be described as a furious quarrel, between the associates; but Elliott was firm, and in the end, Ernest had to give way; so they appeared together with as much good will and friendship beaming on their features as could be conjured up on so short a notice.

They started at sight of David; their previous heartburnings vanished in the presence of this new and alarming danger.

'What is this fellow doing here?' demanded Ernest. 'We have not come to discuss our business with him.'

'Be seated, gentlemen,' said Mr Gadham, by which name, during this interview, the merchant is meant. 'I thought you had been very friendly with Mr Chester.'

'We will not have him here anyhow,' exclaimed the lawyer. 'If he stays, there is an end of our settlement.'

'He tells me that he can materially aid our settlement,' returned Mr Gadham; 'and in fact, what I have already heard from him, proves it. For instance, he says the will'—

'I do not care what he says,' broke out Ernest, who evidently did not want to hear this explanation. 'He is a perjurer, if we believe his own confession; he is a swindler and a cheat. I warn him, that if he does not at once leave, we shall go to the Mansion House and apply for a warrant for his arrest.'

'Then you intend still to assert the genuineness of the will?' asked the merchant.—'to support that which your manner and words alike tell me you know to be a forgery, and a detected forgery too.'

'Genuine! You will find out if you let us leave without a settlement,' retorted Ernest; 'and so will that fellow Chester, your trustworthy accomplice.'

'Very well. Then we shall see what you will say to some other accomplices,' continued Mr Gadham, touching his gong three times, evi-

dently an understood signal, for the door at once opened, and a strange man entered, ushering in two others, who were, of all persons in the world, Geoffrey Coyne, and a man whom David instantly recognised as the omnibus passenger of the preceding day. The stranger who had shown them in retired to a corner of the room.

'These gentlemen,' said the merchant, addressing Ernest and the lawyer, 'are Mr Geoffrey Coyne'—

'And his friend, Cloudy Range Jack,' interposed Geoffrey, 'come here to see fair-play.'

'What merry-andrew business is this?' exclaimed Elliott. 'These fellows can have nothing to do with the matters which brought us here. Let us go, and they will soon find out their mistake.'

'No; you will not go yet,' said the man described as Cloudy Range Jack (Chester started at his voice).—'Don't scowl, gentlemen, but listen to me for a moment. You are forgers and swindlers, and I know it. I am John Spurbrow, once clerk in this very firm' ('I thought so,' muttered David, below his breath)—'witness to old Peter Gadham's will, in company with that man, David Chester. I hear the date is in question; but it will be a waste of time to talk of that, for I can swear my name on the will was not written by me. I can swear this all the more readily, and without waiting to examine the imitation, which I daresay is very clever, because I saw the will we both really witnessed, burned by old Mr Gadham, who did this in my presence, that I should know it was destroyed.'

'This tale may suit you to listen to,' said Ernest, endeavouring to keep up a show of confidence, which his white cheeks and lips and his husky voice painfully belied. 'We will have no more of it.'

'Yes, you will; the best is not told,' continued Spurbrow. 'The rest of my story will interest Mr Elliott as much as yourself. I have just come from Australia, where I had worked for some years at about average miner's luck; but a little while ago, a man who had grown tired of his land, wished to sell it, and I bought it, with the help of my friend Geoffrey here. I knew something of its character; the man who sold it could not have known much about it.' (Ernest Gadham bent a strange hard look on the speaker, and set his white lips tight, as though to control his breath.) 'I got a great deal of gold from this lot in a couple of months,' continued Spurbrow; 'and sold the rest of the ground for twenty times what I gave for the whole. You, Mr Ernest Gadham, are the man who sold the ground; I am the man who bought it. But one good turn deserves another, so I have done you a good turn. Your wife, Mr Ernest' (a general start ran through the company at these words, and Elliott uttered a low exclamation)—'your wife, who happens to be my cousin, or I might not have known of the marriage,' continued Cloudy Range Jack, 'having spent the few pounds you left her with on your very quiet departure, was anxious to find some trace of you, or, failing that, to be with her relations; and as I was coming home to England, and could afford to do so, I paid her passage. She is now in London, staying with the mother of my old friend Geoffrey. That

is my story.—How do you like it, Mr Ernest?—And how do you like it, Mr Ellitt?

Some awkwardness in replying to these questions was perhaps averted by Mr Gadham, the merchant, speaking. 'As to the latter part of your narrative, Mr Sperbrow,' he said, 'although extremely interesting, yet I am not concerned in it, and must leave it to be discussed by those who are.—Mr Ernest Gadham, you have heard the additional evidence bearing upon the will. As I know you have heard all Mr Chester has to say, I will not trouble him to speak. Do you not think it would be advisable to withdraw?' 'As for this trumped-up story of burning the will'—began Ernest.

But Mr Gadham spoke again. 'Your friend will tell you that I gave you sound advice, and you had better withdraw—while you can,' added the merchant, with an ominous significance; 'at least, you had better say nothing at present. You may say something which may force me to call upon the officer who sits there'—pointing to the stranger. 'I am not sure whether, even at this stage, I am justified in letting you go, but at present you are at liberty.'

'And about your wife, Mr Ernest'—began Sperbrow.

The person addressed darted a savage look at him, and then whispered to Ellitt, who, on his part, wore no pleasanter an air than his companion. Without further words, or other leave-taking than a slight bow, the two left the private room, passed through the outer office, and were gone.

'I will not detain you at present,' said Mr Gadham to David. 'All that need be done now is for me to make an appointment with you to see me here on this day week. Will that suit you, Mr David?'

Of course the clerk said it would, and then the party left.

Geoffrey was especially facetious in describing his feelings on the previous evening, when he heard so much which affected his friend Cloudy Range Jack, who, on his part, while returning by Geoffrey's ship, had been communicative on matters concerning Mr Ernest Gadham and the wills made by his father Mr Peter.

Knowing so much from both sides, Geoffrey at once resolved that his friend's best plan was to attend the meeting of the next day, which he found no difficulty in doing, as Mr Gadham was only too glad to secure such an auxiliary.

It is really not worth while to attempt anything like an expanded account of the events which close our story, most of which can easily be foretold; we shall therefore be content to indicate them very briefly. First, then, as regards Mr Ernest Gadham: this gentleman disappeared from his accustomed haunts on and after the day of the meeting at his cousin's. Two writs which were taken out against him on the same day, the very next one after the meeting, by Mr Thomas Ellitt and Mr Manoh Selph, were returned by the officer, who could not find the person for whom they were intended.

Nor was Mrs Ernest more successful in her search, at that time at least, although it was afterwards rumoured that Mrs Gadham had gone to New York to meet her husband. It is pretty certain that the gentleman was never seen in

England again. Mr Ellitt and Mr Selph—the latter being the money-lender—had to digest their disappointment as best they might; but of their proceedings we are unable further to speak.

No one will require to be told that all operations in the matter of the new will of the late Mr Peter Gadham were at once discontinued; and we are glad to say that David Chester's share in bringing about this climax was not overlooked. A free and comfortable home with Geoffrey and Josie was offered to him; but the old fellow, feeling, as he said, that he was good for some years, preferred to accept a liberal offer made by Brisby, Gadham, & Co., in addition to a considerable pecuniary remuneration. Once again, then, he was seated in his old familiar counting-house, the happiest and most cheerful of all the clerks within sound of Bow Bells.

We have intimated that Josie became Mrs Geoffrey Coyne; this occurred within a very few weeks after the discomfiture of Ernest Gadham. As everybody had expected this event, no one was surprised at it; but at an incident which followed within the year, every one, or, at all events, David Chester, was astonished. This was the marriage of that little chit of a Minnie, hardly out of short frocks and pinafores, to Mr John Sperbrow. The somewhat uncomplimentary reference to Minnie just given is an extract from the speech of her sister Josie. It is true the young lady was only seventeen years old, but she was half a head taller than Josie, far more buxom in figure, and of sufficient resolution to accept and marry her suitor, without much regard to her father or sister's satire.

It was not until at least a couple of years after Minnie's wedding, that even old David, who used often to wonder audibly as to what had become of Whitman, obtained any light on the subject. Then he heard from Josie, who could keep a secret as well as any woman, something about a man for whom her husband had paid the passage-money to Australia—on behalf, she understood, of Mr Gadham of Brisby, Gadham, & Co., who had provided the funds. She believed, too, that post-office orders were sometimes sent to this man; but he was now dead. Geoffrey would not like to be asked about this, and indeed he had never told her the man's name. David had no doubt that he himself could have supplied the omission. If this were Whitman, it was the last the old clerk heard of him.

We have shown, we hope, what a well-meaning, honest old fellow was David. He paid, by-the-by, to the deserted wife of Ernest Gadham every shilling he had received from her husband. The old man has now been gathered to his fathers for some years; but his daughters and friends still remember him with respect and affection.

#### THE ROMANCE OF THIEVING.

ALTHOUGH a man always looks upon a clever theft with an air of romance, he never quite realises the position until the thief or sharper has fleeced himself. We are apt to laugh at the misfortunes of the man who puts his head out of his cab on a foggy day, in answer to a knock at the window, and finds his hat disappearing in the gloom. Nor do we show more sympathy with the man who collides with another

individual in the street, and who, on having his hat, which has fallen, handed back with profuse apologies for the accident, finds, from its size and general appearance, that not many hours before it must have adorned a scarecrow.

But these incidents in no way illustrate the coolness and intrepidity of the professional thief, who does not usually aim at trifles. Last winter, an ingenious theft was perpetrated by two well-known pickpockets, who had followed a gentleman out of the stalls of a Leeds theatre. For a moment they parted company, and when the younger joined his companion, he handed him a pocket-book, from which were taken some notes and money. To substitute false notes was the work of a second.

'You have lost your pocket-book, sir,' said the elder thief, hurrying after the gentleman. With a cool bow, the thief hastened away, pleased with the gentleman's thanks—and his watch.

At Birmingham, not long ago, a thief was detected in the act of stealing a gentleman's watch. In his haste to escape, he ran into the arms of a detective, who had been watching him for some time. Naturally, the thief must have felt somewhat excited at such a moment; but if he did, he showed no symptoms of being so. Although instantly secured by the unenviable handcuffs, he had the presence of mind to pass the watch unobserved into the pocket of a passer-by. This person was puzzled to know how he became the possessor of the watch, and being afraid of keeping the gift, was sufficiently honest to hand it to the police.

Another instance of the remarkable coolness and audacity of a thief, though perhaps not an uncommon one, is worth relating. One day, a Liverpool 'stark'—a man capable of doing mischief of any kind for a trifle—having watched his opportunity, took up a coat that hung outside a pawnbroker's shop. Flinging it over his arm, and carrying it into the shop as if intending to make a purchase, he offered it for sale. Not recognising his own property, the pawnbroker bought the coat. But even this did not satisfy the thief. He handled some silk handkerchiefs, and in choosing one, remarked carelessly: 'Take pay for this out of the money for the coat.'—'But I have given you the money,' indignantly answered the pawnbroker.—'O no; you haven't,' said the thief.

A warm altercation ensued. In vain the shopman protested that he had paid the money; and at last the thief went out in search of an officer to settle the dispute, taking with him some silver spoons, several silk handkerchiefs, as well as the silk handkerchief in question, which in his excitement the broker had forgotten.

But the thief is not always so cool and collected as we are wont to believe him. He is especially unnerved by hunger and the police. Not long ago, a well-known actor, whilst in the provinces, had occasion to walk some distance at midnight, and was stopped on a lonely road by an ill-clad ruffian. 'Fool!' muttered the actor coolly, 'there's an officer within a hundred yards of us; I'll'—With an exclamation, the thief disappeared over a wall; and the next morning his dead body was found in a river close by, into which in his haste he had fallen.

Some five or six years ago, the shopkeepers of Bradford were thrown into a state of alarm by a couple of young lads. One of the two used to

make a small purchase at a shop, and, by telling a plausible tale that a boy outside would take the purchase from him if it were seen, he got the shopman to put the article down the back of his coat. Whilst thus employed, the ingenious youth very easily relieved the shopman of his watch, and then bolted. After him came 'the boy outside,' to inform the shopman of his loss. The latter, having had carefully described to him the road the thief had not taken, ran at once after the culprit, the second boy in the meantime helping himself to the contents of the till. How often this larceny was practised, few shopmen in Bradford care to remember.

Once, for the writer's edification, a young lad, not more than fifteen years of age, undertook to stand in a prominent thoroughfare in Leeds and open the ladies' satchels as they passed without being observed. He never failed once, and very often succeeded in taking out their purses also, which of course were immediately returned intact.

It is often argued, that if taken from their evil associates, many thieves would reform. It is very doubtful; they love their nefarious orgies and their liberty too dearly. One instance in support of this is enough. A clergyman in Bristol once interested himself in the welfare of a penitent thief, and secured a situation for him in South Australia. But while at his benefactor's house, listening to the bright prospects that awaited him, the thief was stealing the good man's spoons, watch, and ring. The chances of becoming rich in a day are further inducements, as in the case of the gambler, to continue their life of recklessness and crime. A Liverpool detective once stated that four hundred pounds and several watches were found upon a notorious pickpocket during a festival in that city; and it is no uncommon thing for a couple of thieves during the Derby week to steal five or six hundred pounds-worth of valuables.

## A SMUGGLING ANECDOTE.

FIFTY years ago, there resided in a small farmhouse near a seaport town in the north of Scotland a man named Angus Mackenzie. He was tall and strong, over sixty years of age, and, like most strong persons, good-natured. 'Old Angus'—as he was generally called by the townspeople—was a great favourite amongst them, for it was mostly through him that they got their untaxed whisky. It was an open secret that Angus was a smuggler, but hitherto he had been very fortunate, and the custom-house officers could never catch him. Angus was none of your cut-and-thrust type; sword or pistol he never touched. He was a cautious, cunning, witty old fellow. Few men could tell a better joke; and this very cunning and wit pulled him clear, when bolder means would have failed. Time after time had the excise officers—or 'gaugers,' as they were commonly termed—attempted to catch him in the act, but in vain.

On one occasion Angus received notice that a cargo would be run, and left at a certain place about ten miles from the town. With his horse and cart, he started late one night, taking a quantity of peats (turf-fuel) with him to cover the kegs. Having found the cargo all right, he

loaded his cart, with the assistance of a friend, put the peats on the top, and after a rest, started for the town, where he intended to deliver the whole at the residence of a worthy householder, for he rarely took any to his own house. He had arrived within three miles of the town, and was leading his horse by a rope-rein, when there sprang out from the deep open drain at the roadside two excise officers, who, a few months before, had visited his house.

'Ha, ha! Caught at last, Old Angus!' they shouted. Going to the back of the cart, they began to throw the peats on to the road, and at once discovered the kegs. They were perfectly overjoyed. Here at last they had captured the man who had given them the slip so often; and what a splendid haul too!

'Are these buttermilk barrels?' asked one of the excisemen, in high glee.

Angus simply smiled.

'Drive on, Angus—drive on! We will see when we get to the town-hall what they contain.'

'Weel, weel, gentlemen; it's yer trade to prevent the guid drap passing ye, an' it's mine to do otherwise; so every man to his ain trade.—But, gentlemen, there need be no ill-will; so, come an' hae a bit snuff an' a crack.'

Knowing that Angus was a perfect storehouse of good jokes—few could tell a better story than he—and feeling more than pleased, they placed themselves one on each side of him, and started for the town, walking all three in front of the horse, which Angus led.

Angus, holding the long rope-rein, and placing his hands behind his back, gradually allowed the line to pass out until the horse was twenty feet behind him; but so much did the officers enjoy the old man's conversation—and he did his best to keep their attention engaged—that they failed to observe what he was doing. As they approached the town, he quietly drew in the rein again until the horse's head was just at his back.

When they entered the main street leading to the town-hall, the news flew like wildfire that Old Angus had been caught by the gaugers. Soon a large crowd followed them. The excisemen were triumphant; it was a red-letter day for them. When the town-hall was reached, the cart was stopped, and the officers, with a look of great importance, proceeded to take off the back door of the cart. No sooner had they done so, than consternation reigned. Where were the barrels? Only a few peats were in the cart! What could it mean? The crowd sent up a shout of derisive laughter. Jumping into the cart, they threw out the peats; but not a keg could they find.

Furious with vexation and passion, to be foiled just when victory was so certain, they jumped out of the cart, and were proceeding to enter the town-hall, when Angus stopped them. 'Gentlemen,' said he, 'ye thought fit to throw part of my peats into the road about three miles out, an' now ye throw the rest on to the street. Na, na, sirs; I hae done nothing wrang that ye can prove; sae, ye maun jist pit back my peats. Be very thankful I dinna make ye come back the three mile an' pit in the rest.'

The crowd, elated at the discomfiture of the excisemen, entered into the spirit of the joke, and shouting out, 'Yes, yes; ye maun do so, or else we will make ye,' surrounded the

officers, who, knowing the temper of the men they had to deal with, threw the peats back into the cart amidst the loud laughter of the bystanders.

When they had done so, Angus remarked with his peculiar pawky smile: 'Weel, gentlemen, ye hae done no sae bad. I'm awa' back for the rest o' my peats; perhaps ye would like to come?'

The excisemen, without deigning a reply, entered the town-hall. Old Angus proceeded back for his peats, followed by a ringing cheer from the crowd.

The affair was the talk of the town for several days; and how Old Angus had hoodwinked the gaugers was a mystery. But gradually the facts leaked out, and the joke was so good that it could not be kept. When the excisemen discovered the kegs, Angus knew that unless he got the gaugers to the front of the cart, all would be lost. Having got them to walk with him, and so leave the back of the cart unprotected, the rest was plain sailing, for, passing out the rein as far as possible, and keeping the excisemen's attention fully occupied, he knew that his friends, who were always on the outlook for danger, would be sure to see how the land lay and do their best to help him. The roads in those days, where Macadam was unknown, were of a very rough nature, consequently a cart made a fearful noise jolting over the roadway. Three of his friends, who had seen all, and taken in the situation at a glance, crept up to the cart; and one of them getting into it, handed out the kegs, which were rolled into the open drain at the roadside; and then hurrying off for a cart, they put the barrels into it, and placing the peats that the excisemen had thrown out of Old Angus's cart, on the top, one of them drove into the town and delivered the whole lot at the house intended, very shortly after Old Angus had left the town-hall.

## THE MONTH:

### SCIENCE AND ARTS.

THE Jubilee of Queen Victoria has been celebrated in a variety of ways; but no more useful method of commemorating the event has been suggested or practised than that adopted by the Cape government. The Superintendent-general of Education, with the authority of the government, arranged for the celebration of the Queen's Jubilee throughout the colony by the plantation of trees in each village. The school children were the agents in this laudable undertaking, of such importance in a land of drought; and every facility was given them to carry out the work effectually. It was arranged that all teachers and assistants, and the scholars of the senior classes, were each to plant a tree, and were to be responsible for its care during the ensuing year. If there happened to be no suitable spot adjoining the particular school to which the scholars belonged, excursion parties were formed to plant seeds on the slopes of the nearest hills. There were no public funds available for the work; but the Education Office assisted to the best of their power, both in choosing the trees most suitable for the localities, and in many cases

in forwarding a supply of seeds gratuitously. As June is rather an early month for tree-planting in the northern, midland, and eastern districts, the operations have been postponed in those localities until August and November, in which cases the birthdays of two of the Queen's sons will be thus commemorated.

The eclipse of the sun which will take place on the 19th of August is engaging the attention of the various observatories. Although our own government will not send out an observing expedition, England will be represented by two astronomers who have received invitations from the Director of the Moscow Observatory, near which city the eclipse will best be seen. The duration of totality will be longest in the south-east of Siberia, and will last there nearly four minutes. In Japan, this period will be reduced to three minutes. We may mention that in England the sun will rise partially eclipsed; but soon after sunrise it will cease to be obscured. In Prussia, the eclipse will be seen 'total' just after sunrise, and that is the most westerly point at which the phenomenon can be thus seen.

We have so often advocated the use of oil at sea as a remedy for troubled waters, that we gladly call attention to a pamphlet lately issued by the United States Hydrographic Office, which records some observations made by Lieutenant Underwood. He says that two quarts of oil per hour properly used are quite sufficient to prevent much damage both to ships and small boats in heavy seas, but the oil should be of the right kind. Mineral oils are not nearly so effective as those of animal or vegetable origin, and the best results are obtained in deep waters. Amid breakers or surf, the effect of oil at sea is not so certain, but still some benefit from its use may be expected. Lieutenant Underwood advises, that when an attempt is made to reach a wreck, the rescuing vessel should use the oil after getting as close as possible under the lee of the wreck. The vessel may then be expected to drift into the oily surface, when communication may be made with her by boat.

The sudden incoming of unusually hot weather has brought a great deal of correspondence to the newspapers on the subject of mosquito and gnat bites. One writer recommends bruised fern fronds as a remedy for these painful stings. Another, relying upon his experience in India, tells us that a paste made of ipecacuanha powder and ether is a sovereign remedy. Another recommends a tincture of *Ledum palustre*, which he assures us is the only remedy that he, a martyr to gnats, has found of any real service. This drug may be obtained of any homeopathic chemist; and a tea-spoonful in half a tumbler of water makes a lotion which will be effectual. It is a curious circumstance that these troublesome bites, while hardly affecting some persons, are productive of great torment to others.

Several instances have been recorded where telegraph wires have shown signs of disturbance during earthquake shocks; yet seldom has any dangerous effect been observed. But, according to Lieutenant-colonel Benoit, Director of Artillery at Nice, the recent earthquake shock on the Riviera was accompanied by a curious incident in a certain telegraph office under his jurisdiction. The operator in attendance on touching the key

of the instrument felt a violent shock, which threw him into his chair, where he remained motionless for some time. His arm was temporarily disabled, and he could not resume his work until the close of the day. The matter was investigated, when it became evident that the sufferer had received a very strong electric shock, the effects of which he is likely to feel for some time.

The results of a series of experiments on the influence of different beverages on digestion have been published by Dr James W. Fraser. From his investigations, he is able to lay down certain rules. The digestion of starchy foods is assisted by tea and coffee, whilst that of meat is somewhat retarded by the latter beverage. With infused beverages, eggs are the best form of animal food to eat. Digestion of butter used with bread is delayed in the presence of tea, and probably proceeds more quickly when taken with coffee or cocoa. As a general rule, albuminoid food-stuffs should not be taken at the same time as infused beverages.

Photography in natural colours is a subject which comes up periodically as a matter of discussion in our newspapers. It is the goal to which, in the opinion of many people, photography must inevitably tend. But by those who have given careful consideration to all the varied points entailed, it is regarded as an impossibility. The report that photographs have at last been taken in all the varied hues of nature has once more arisen, and over-confident journalists have given it credence. The recent report differs from those which have occurred in previous years in the fact that the discovery has been linked with the name of a well-known London photographer; but it appears that he did not give his sanction to the statements made. What he appears to have done is this: he has discovered an entirely new method of colouring photographs by a process in which no artistic assistance is necessary. The process is dependent to some extent on light; but it is altogether distinct from the operation of taking a picture by means of a camera. This is done in the ordinary way. A negative is produced, and from that, negative prints are obtained, and coloured by a subsequent mechanical operation.

It is said that a tunnel is to be bored under Gray's Peak, in the Rocky Mountains. It will pierce the mountain four thousand feet below its summit, will have a length of twenty-five thousand feet, and will give communication between the valleys of the Atlantic and those of the Pacific side, saving a distance of some three hundred miles in the road which must at present be traversed.

It will be remembered that some months ago Mr Ellis Lever offered a prize for a perfect safety-lamp for the use of miners, and that the judges who were appointed to examine the lamps sent in for competition declared that no lamp submitted to them fulfilled the somewhat onerous conditions laid down. Professor Sylvanus Thompson was one of the adjudicators in this contest, and he has written to the *Times* commenting upon the recent lamentable disaster in the Udston Colliery, by which many lives have been lost. Remark- ing upon the melancholy fact, that upon three of the bodies brought up from this mine articles were found which might be used for opening the

present form of safety-lamp, he says 'that the Electric Lamp is the only form that can defy the criminal folly which, to all appearance, has been the cause of the accident in question.' He tells us that since the competition referred to, several forms of Electric Safety-lamps have been perfected, one of which, invented by Mr J. W. Swan, was shown at the Birmingham Exhibition by the British Association. He also says 'that he knows of the existence of several other thoroughly practical and reliable lamps.' The owners of fiery mines should certainly lay these words to heart; and no consideration of expense should delay the substitution of these new lamps for those old ones whose claim to the title 'safety' is so open to question.

A curious instance of the sagacity of birds is recorded by a correspondent of *Nature*. Some sparrows began to build a nest against a white house in a creeper which was almost bare of leaves. This nest the writer removed, when the birds began to build another. This was again removed, because of the objection to noise and dirt so near the windows. A third time the birds began to build their nest, and a third time it was taken away. But on this occasion, although the nest was only just begun, it had some eggs in it, and the birds had covered it on all sides with the white flowers from a shrub which was growing below, the intention apparently being to render the nest less observable against the background of white wall near which it was built.

Civilisation invariably brings in its wake a number of ailments that people in a more savage state of existence do not suffer from. A curious instance of this has lately been recorded at Berlin, where two telegraph operators, a man and a woman, both otherwise in good health, are being treated for a strange and altogether hitherto unknown affection of the hands. The finger-nails are dropping off one after the other, and this is attributed to the constant jar caused by tapping and pressing with the finger-ends, necessary in working the Morse key.

In all treatises on physical geography, a number of illustrations are given in order to demonstrate the fact of the rotundity of the earth; but so far as we can remember, the deformation of images on large sheets of still water, due to this convexity of the globe's surface, has not been included in those illustrations. Professor Dufour of Morges has called attention to this curious phenomenon, and he points out that those images, instead of appearing equal to the object which gives rise to them, are sometimes so compressed in a vertical direction as to appear quite different from the original. This is the case with a certain church tower which is seen reflected in the Lake of Geneva. The same thing can be observed in images of distant ships, when the eye is near the water-line. According to this observer, the roundness of the earth is perceived as distinctly as that of a ball held in the hand.

The Local Government Board has lately had before it the question of using salt water for street-sprinkling at seaside places; and the evidence given by different authorities was of an interesting character. At Bournemouth, a complete system for watering the roads in this manner has been designed by the surveyor, Mr Andrews, who stated that the water would not cost more than fivepence

per thousand gallons. It was stated that salt water is particularly successful in laying dust, as it forms a kind of skin, which binds the surface together, or, as one authority expressed it, 'the salt water "gums" the surface of the road.' There seems to be no objection to this surface incrustation of salt, for it causes no inconvenience in the sewers, and has no prejudicial effect on the health of man.

According to the *Lancet*, a new test for milk has been proposed. This test depends upon the fact that a certain chemical—the sulphate of Diphenylamine—is coloured blue by the presence of an extremely dilute solution of a nitrate. As well-water always contains more or less nitrate, its presence in suspected milk can easily be ascertained by the use of this chemical. To use this test, a small quantity of the sulphate is placed in a porcelain cup, and a few drops of the suspected milk are added to it. The mixture will speedily show a blue tinge if the milk contains even five per cent. of average well-water. The chemical named can be readily obtained, and it is cheap.

Some months ago, we called attention to the endeavours that were being made to test the value of torpedoes by launching them against the old ironclad *Resistance* at Portsmouth. This old ship most thoroughly bears out its name, for up to the present time it has successfully resisted all attempts to demolish it, although nearly every means that science could suggest has been brought against it. These torpedo experiments have recently been renewed, and the old ship is once more the subject of attack. The wounds received in previous attempts have been patched up, and to all appearance the ship is as unhurt as when these trials began. The last effort consisted in the explosion of the enormous charge of two hundred and twenty pounds of gun-cotton. This charge was sunk to a depth of twenty feet below the water-line, and thirty feet from the hulk. The explosion was terrific, but the old ship still remained unmoved. One remarkable result of the experiment is, that the steel booms to which the torpedo netting is attached practically remain uninjured—they were a little bent, but unbroken, and maintained their position. The conclusion to which this marvellous result points is, that the attack by torpedoes can be successfully resisted by properly arranged netting.

The system of lighting trains by compressed oil-gas, which has been so largely adopted on the numerous railway lines, has recently been applied to the illumination of London omnibuses. The reservoir holding the gas is of copper, and is placed beneath the steps of the vehicle, the gas being stored in it at an initial pressure of ninety pounds on the square inch. This reservoir holds sufficient gas for three days' consumption, and feeds two lamps, one of which is an ordinary railway-carriage roof-lamp placed inside just above the door; the other being a square lamp with a white reflector placed inside the omnibus at its forward end. The reservoir is easily charged from portable cylinders which are sent out from the oil-gas works. This system will no doubt become general in omnibuses.

Few people imagine the great saving that accrues from the use of soft water in large

establishments. At a recent meeting of the Metropolitan Asylums Board, the result of adopting a soft-water supply at the Darent Asylum was reported. From this Report we find that the estimated reduction in expenditure in the several departments of the asylum and schools, consequent upon the adoption of soft water instead of hard, has amounted to more than eight hundred pounds. The saving in value of soap and soda alone amounts to three hundred pounds. In addition to this, much material and labour has been saved in other ways. There is also a great reduction in the annual wear and tear of the steam-boilers and circulating-boilers, which no longer get incrustated with lime; besides a great economy of coal. It is pointed out that in addition to the direct saving, there is an indirect economy in the reduced wear and tear of the linen when washed in softened water. The system at this asylum is known as the Atkins Water Softening Process.

Another great canal enterprise has been entered upon; this is the cutting of a channel between the North Sea and the Baltic; and operations were commenced last month by the laying of the foundation stone of a lock near the Baltic end of the future waterway. The total cost of this great undertaking is estimated at nearly eight millions sterling, and the necessary money has already been voted by the German government. A curious feature with regard to this canal is, that it is not so much for trade as for defensive purposes. In some respects, this canal, although a far greater undertaking, may be compared to that of Corinth, for it will save the government the cost of maintaining two separate ports on either sea, or, rather, it will connect these two ports together. The length of the canal will be about sixty-one English miles, and it will have a width and depth sufficient to allow two vessels of the largest dimensions to pass one another. Although this canal cannot be compared with that of Suez, or with that upon which M. de Lesseps is now engaged at Panama, from an international point of view, its completion will be an engineering achievement only second to them in importance.

It has been remarked that, despite all precautions, a theatre is a building which sooner or later is doomed to destruction by fire. There is much truth in this saying; but it certainly ought not to apply to recent erections of the kind, for the art of fireproof building is now well understood. Still, the contents of a theatre are of an inflammable kind, and every care should be taken not only to prevent fire but to allay panic, which is often quite as disastrous in its effects. Among the means of speedy egress which have been advocated is the placing of tablets covered with luminous paint in the various corridors, so that, should the gas be suddenly turned off, persons can readily find their way to the outer doors. Experiments with these tablets are now being made, and they will probably lead to their use in many other buildings beside theatres. It is necessary to place them near a lamp, otherwise they do not shine.

The immensely high tower which is to form a principal feature of the Paris Exhibition of 1889 will have such an unusual altitude that ordinary modes of ascension will be impossible. Few per-

sons would undertake to mount a staircase one thousand feet high, and therefore a lift becomes a desideratum, if the promoters of the scheme expect their tower to bring in any returns in the shape of hard cash. The method proposed by which the difficulty can be mastered is as follows: the ascending room, or cage, will be erected on a vertical screw shaft. This will be rotated at the base of the tower by some form of motor, probably electric. The cage itself will not partake of the revolving motion, for it will slide in fixed guides; but the screw cut upon the shaft will cause it to ascend.

The Photographic Convention of the United Kingdom, started only last year, held its annual meeting at Glasgow last month. Papers upon various subjects were read, and pleasant photographic excursions formed the lighter work of the members engaged. Photography is now such an aid to all branches of science and art, that these annual gatherings will speedily assume very great importance.

## OCCASIONAL NOTES.

### DELTA METAL.

THE discovery of alloys possessed of special properties has attracted the attention of metallurgists from the earliest times, whose constant attempts to form successful admixtures of two or more metals in varying proportions have produced many combinations of high value in industry and art. One of the most recent discoveries of this class has received the name of Delta Metal, and is formed by the introduction of a small percentage of iron into copper-zinc alloys.

Nearly a quarter of a century ago, Aich and Baron Rosthorn of Vienna perceived the high character possessed by this compound both as regards strength and tenacity. No practical results, however, followed their observations, and the matter remained in abeyance till within a comparatively recent period, when the difficulties experienced by the early promoters in producing an admixture of reliable and absolutely uniform character were overcome after considerable research by the introduction of a definite and known quantity of iron, also a percentage of phosphorus; and in some cases tin, manganese, and lead, when special qualities are required. The iron becomes chemically and not merely mechanically combined in the alloy, a fact proved by the inability of rust to corrode, and the magnetic needle to become attracted by the metal under consideration. Thus Delta Metal was placed on the market as an article of commerce, carrying with it certain sterling characteristics.

The specific gravity of Delta Metal is 8.4—that is to say, it differs but little in weight from copper; while its melting-point is eighteen hundred degrees. In colour, the alloy bears a close resemblance to gold; whilst it possesses the great advantage, as we have said, of being untouched by rust or corrosion. This fact, taken in conjunction with the excellent results attained both as regards tensile strength and elongation, and the cost at which it can be produced being identical with that obtaining for the best brass, a material very liable to tarnish and discolour, make it evident that a future undoubtedly lies before Delta Metal.

Amongst other advantages, the alloy can be worked both hot and cold, and can be rolled, stamped, cast, forged, or brazed with equal facility. The castings are particularly sound and free from blowholes—a frequent source of loss and annoyance with those made in brass—whilst possessing, it has been computed, three times the strength of brass castings.

Delta Metal can be applied to the following uses: parts of rifles, guns, torpedoes, tools for gunpowder-mills, parts of bicycles, gongs, &c.—formerly made of steel; in pumpwork, to supersede brass, and extensively in ships' fittings; in chemical manufactures, where other metals would rapidly corrode; in shutters, for bolts and nuts, propellers, anchors, cranks, cog-wheels; and in a large number of ornamental and domestic goods, harness-fittings, spoons, forks, cups, fenders, vases, and candelabra, and a large variety of other goods where handsome appearance is a desideratum.

It is difficult to limit the applications to which Delta Metal lends itself; and after careful perusal of the results obtained, in subjecting the material to a series of searching tests, to ascertain its tensile and ductile strength, it is impossible to doubt that in quality and appearance, in addition to its valuable non-corrosive properties, the alloy is well calculated to fulfil the expectations of its introducers.

#### THE SWINTON TELEPHONE.

A very simple but effective telephone, says *The Times*, is now being introduced to public notice, which constitutes a distinct departure in this class of apparatus. This telephone is the invention of Mr A. A. Campbell Swinton, and each instrument comprises a direct-acting multiple microphone transmitter, a self-contained call-bell, a push-button, and an automatic switch. These main parts are mounted on a polished teak base-board, to which are attached two electro-magnetic receivers.

The transmitter consists of a small lead frame about three inches square, suspended by pieces of india-rubber, so as to be unaffected by external vibrations or tremors. From side to side of this frame, just at the top, is stretched a thin platinum wire, on which are strung about a dozen thin carbon pencils, the lower ends of which rest lightly against an insulated horizontal carbon block fixed across the back of the frame. This forms a powerful multiple microphone, which is capable of very delicate adjustment. The microphonic regulators are so sensitive that they are readily actuated by the direct impact of the atmospheric sound-waves on themselves alone, without the intervention of any diaphragm, tympanum, or auxiliary sound-receiving surface of any kind, or the aid of any mouth-piece or voice-tube. One simply speaks at the row of carbon pencils.

Each receiver is of the usual external shape, and within it is a small soft iron electro-magnet, opposite one pole of which is an iron armature carried by a very thin, tightly stretched membrane of non-inductive material, so prepared as to be unaffected by moisture or other atmospheric conditions. The multiple microphone transmitter is of such a powerful character that it has been found practicable, even on long lines,

to dispense with the induction coil usually employed with other telephones. The transmitters, each pair of receivers, batteries, and line wire, are all connected in series on one circuit, the two receivers at one station being, however, placed in parallel, in order to reduce the self-induction of the circuit and any tendency to extra current disturbances. This arrangement, while being very simple, has, it is stated, the advantage of causing the instruments to be singularly free from inductive interference from neighbouring telegraph or telephone circuits—a very important point in crowded districts.

These instruments are being introduced by the Equitable Telephone Association, of 75 Queen Victoria Street, London, with the view of meeting the requirements of those who desire cheap and efficient telephones, which they can purchase outright for personal intercommunication.

#### SONNETS.

##### LIFE.

THE air was heavy with the fragrant scent  
Of crimson roses, and fair lilies gleamed  
Whiter against a sun that broadly beamed  
O'er all the scene. The song of birds upwent  
Beneath an orchard's leafy-vaulted tent,  
Where golden fruits hung glossy; and I deemed  
That such was life; so, till I fondly dreamed  
Death came not there. But when I closely bent  
A keener gaze upon the bright-hued flowers,  
The roses hid a worm within their heart;  
A canker gnawed the fruits, and as the hours  
Passed slowly on, I saw their bloom depart;  
While through my heart an echo of the strife  
Rang, sadly shrilling: 'Thus it is with Life.'

##### DEATH.

ALL nature slept. The soft voluptuous air  
Sighing through foliage bathed in silvery light,  
Scarce broke the stillness. Peacefully and bright  
Outspread the waters of a lake that bare  
The living snow of lilies. Everywhere  
Was perfect restfulness, and as the night  
Grew older, even the breezes died. The night  
Of nature slumbered, and her Beauty there  
Reigned monarch. Patiently I watched through hours  
Of silent dreaming, longing for the rest  
That blest all nature—birds and trees and flowers,  
Till, as I wore, in my restless breast  
I heard this whispering of a ghostly being:  
'Mortal, the rest thou seekest lies in Death.'

H. DAWSON LOWRY.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

## AN OLD ENGLISH FAIR.

At one end of the picturesque old High Street of the ancient city of Winchester there rises conspicuously a steep hill. It shuts in the town at the east end; and though the town is now making efforts to climb up where it may, and to spread away to the breezy healthful downs beyond, the face and summit of the hill itself happily cannot be covered with bricks and mortar, for it is public property, and forms the park of the citizens. On the steep westward side are cut winding walks, where young trees and shrubs are planted; while wild downland flowers linger among the grass. On the south, the outline is wilder; the chalk has crumbled away, and is left white and bare and jagged like sea-cliffs, suggesting a reversal of the Laureate's line, 'There rolls the deep where grew the tree; and hinting of days when the white walls of Winchester may have been lapped by blue waves, and the site of her cathedral been lost in 'the silence of the central sea.' The green hilltop, and even the excavation in its side, which a railway in piercing the hill has made, add not a little to the beauty of the narrow street below; and from the summit there is as lovely a view of gray cathedral, red roofs, and trees, the long High Street, and hills again beyond, as one need wish to see.

Standing on that hilltop on an autumn morning, when the sun is on the city, and the figures of the citizens are seen leisurely going about their business, and the voices of a few children and the slow chime of the cathedral clock alone break the silence—it is difficult to conjure up the scene on this same St Giles' Hill in September five or six centuries ago. The whole plateau of the hill, so the vision would reveal to us, is seen to be covered with what looks like a second town, a town of little wooden houses or booths, set out in regular streets, and shut in, not by stone walls with massive gates, like the city below, but by a high wooden palisade. The streets are devoted to rude shops, each street to one special kind of merchandise,

or to traders of one nation, and named accordingly, after the good old fashion which survives in the nomenclature of many streets to-day. There are trades in wine, in spices, in drapery, in the wares of the goldsmith or the brass-worker, the potter and the furrier; monastic shopkeepers, Normans and Poles, and Cornish men, who, in their far Celtic corner of the land, hardly ranked as Englishmen in those days; and, in one quarter, a show of birds and beasts, where the great folks, and the monks, who in their quiet life may well have been glad of a little quaint animal companionship, might pick up a curious pet in the shape of a monkey, a bear, a falcon, or a ferret. Gothic taste still introduced the carved likenesses of such creatures in the churches of the time. And this odd little wooden town is crowded with an odder set of figures than even the great Exhibition year of 1851 brought together in a friendly throng. Foreigners at their varied stalls preside over their representative goods; a medley of buyers and sightseers, citizens and strangers, mingle in the streets. Here are nobles and ladies in the rich costume of the period; men in tunic and mantle, long hose and pointed shoes; women in straight graceful gowns and wimples; artificers, servants, brothers from the monasteries. An occasional horseman, sharply eyeing all that goes on, and looking out for the tradesman who is more shrewd than honest, or the yokel who has drunk more beer than he can carry peaceably, acts as policeman; and as police court and appeal court in general, there stands in the midst of the town the great Pavilion of no less a person than the mighty Lord Bishop of Winchester; while at the north side of the hilltop is the chapel of St Giles, the saint in whose honour all this noise and bustle are supposed to have originated. For the great St Giles' Fair is being held.

Free trade, railways, good roads, popular government, have now swept these old marts off the face of England. In Germany and in Russia, the custom lingers; but the shows and merry-go-rounds, shooting-galleries, and sweet-

stuff stalls of to-day, are but a miserable mockery of those old English fairs of which St Giles' in Winchester was for centuries one of the largest and most important. How they came to be held on the festival days of saints, when people gathered together in great numbers to worship in some church—how the feast-days developed into holidays, and the holidays into fairs—how the churchyard of the church whose patron saint was being honoured was a common place for setting up stalls of merchandise—how the king granted privileges to regulate the fairs, and his shaky revenues or the revenues of the church benefited at the expense of local shopkeepers—and how Sunday was a specially favourite day for these carnivals, until the pious King Henry VI. forbade such a breaking of the Sabbath—is perhaps tolerably familiar to us. But the vast importance, the commercial significance, the curious tyranny, and the quaint ceremonies of these forerunners of International Exhibitions and Colinderies, are more difficult to realise; so that one welcomes the translation, lately edited and published by Dr Kitchin, the learned Dean of Winchester, of the charter granted to St Giles' Fair in 1340, which still exists among the ancient documents in Winchester Cathedral, as giving us some insight into the practical working of the thing.

Winchester had then ceased to be the proud capital of England; she was sinking and paling before the rising light of London; her varied trades would not long suffice to keep her in the forefront of commerce; her old castle was no longer the chief residence of our kings, or the meeting-place of our parliaments. But her greatness was not yet past, and her mighty fair, held, according to this charter, 'from time immemorial,' was still in all probability the principal emporium in the kingdom, celebrated throughout the civilised western world. The revenues were granted by the Red King, whose charter is the first that can be traced, to the Bishop of Winchester. And to the bishop—with the exception of small payments to several religious houses—they continued to pass, and were, it would seem, employed in the erection of the magnificent cathedral, in the time of Rufus, by Bishop Walkelyn, whose fine Norman crypt and other parts still remain; and later on by Edyngton, who was beginning to recast the nave in the Perpendicular style carried out by Wykeham. Edward III. refers to the past charters in his own grant, exalting the fame of his predecessors at the same time. 'The Lord William of renowned memory' granted a fair of three days; 'Henry of glorious memory' extended it to eight days; 'the Lord Stephen of famous memory' gave six additional; and 'the Lord Henry of good memory' made up the number to sixteen. For a fair of sixteen days King Edward ratified the grant, and the benefits thereof, to the bishop; 'and lest, through growth of human badness and lapse of memory, these should hereafter become doubtful, or be challenged and subtly disputed, and rather that they may surely and indubitably remain and last for ever, we for ourselves and our heirs have fully granted, and by this our charter have confirmed to the said Bishop William and to his church the perpetual enjoyment during the sixteen fair-days for himself and his successors of all and singular

the liberties, immunities, and customs aforesaid.' Through the 'growth of human badness,' or other causes, His Majesty's prospective beneficence is not of much account to the Bishop of Winchester in this nineteenth century; but at the time, the grant must have been of no small consequence.

In the first place, all trade was stopped in the city. 'No tradesman of Winchester or other man shall sell or offer for sale any merchandise or goods; and if they do, such goods shall be forfeited to the bishop.' Even the pedlars were not allowed to take round their 'small goods, such as purses, gloves, knives, &c.,' without paying a tribute to the bishop for the privilege of opening their packs. And in the second place, no merchant might sell or show goods within a circuit of seven leagues of the fair, on penalty of forfeiture of the goods to the bishop. Seven leagues were about ten and a half miles; but, by a special clause, Southampton, twelve miles distant, was included in the edict as far as all things except victuals were concerned. The trade of the whole district was thus forced to St Giles' Hill—Southampton, though protesting, having to submit; and for everything that entered the fair, toll was paid to the bishop, save by the merchants and citizens of London, Winchester, and the Honour of Wallingford. For all firewood, corn, hay, and charcoal that came into the city, a customs duty was also levied; and 'for every stall for the sale of bread in the top of the High Street of the city on the Sunday in fair-time, a halfpenny.' Some of the dues were pretty heavy. My Lord Bishop took fourpence for each falcon, ferret, ape, or bear, or cask of wine or cider sold; appropriated a fat goose out of every baker's dozen, charged fourpence for a cartload of merchandise, twopence for a pack of mercery, a penny for every 'burden borne by a man,' a halfpenny for each smaller pack; and so on.

Nor were these arbitrary restrictions imposed upon trade, all, though probably the city traders hardly approved of this influx of foreigners and the interference with their business. Matthew Paris recounts how, in the year 1245, Henry III. filled his purse by establishing a fair at Westminster, and ordering all the London traders to shut their shops, and all other fairs throughout England to be suspended for fifteen days; and how he tried the plan again four years later; but on both occasions the storms and rains made the unfortunate dealers' days anything but fair days, and spoilt their merchandise.

Surprise has been expressed that towns submitted to this ingenious method of taxation. But besides this, Winchester yielded up all civic authority to the bishop's representatives; and the worthy mayor and all other functionaries retired for the time being into private life. Jurisdiction over the burgesses as well as commerce was all regulated from that Pavilion, or *Pavilionis Aula*, on the hill, whose memory is handed down to the present day in the curiously corrupted name of a house, Palm Hall, which stands, a perpetual puzzle to the unlearned stranger, on its site. On the eve of St Giles' day (August 31), there entered the city at sunset by the King's Gate, or the Southgate, the justiciaries of the bishop; and at the gate the mayor, bailiffs, and citizens were bound to meet them and hand over the keys and custody of that

gate. Next, they all rode together to the Westgate—the picturesque ivy-clad old gate which still spans the upper end of the High Street—and received the keys of that entrance and the ‘tron’ or measure of wool of the city; and the proclamation of the fair and the suspension of the town’s business was read. Similar ceremonies followed at the Northgate and the Eastgate, after which the civic rulers escorted the bishop’s functionaries to the Pavilion, and were there dismissed to their homes. The justiciaries forthwith chose mayor and bailiffs, marshal and coroner, to their own liking, and their sixteen days’ rule of the city began. ‘And the bishop, from the time that the keys and custody of the gates have been delivered to him, shall, by his justiciaries and other ministers, have custody of the whole city, and cognisance of all pleas between the men and tenants of the city and all other persons, within a circuit of seven leagues round the fair, regarding breaches of law, debts, and all contracts.’

The next day, September 1, business commenced in earnest. Guards were set at the outposts of the city, on all the main roads, to levy toll on saleable goods; sellers of food in the city were removed, together with their comestibles, to appointed spots outside the city, where only they might dispose of their bread and other victuals; while a species of contract for the supply of food to the buyers and sellers at the fair was entered into, by every butcher, baker, and fishmonger in the place being commanded to repair to the Pavilion, and from them being chosen ‘the most competent, lawful, and discreet men to serve those who come to the fair with wholesome, useful, and sufficient victuals;’ and woe betide him who sent bad stuff, for it was forfeited, and the owner ‘none the less heavily fined.’ Meanwhile, an inspectorship of weights and measures, and supervision over the quality and quantity of meat and drink sold, was exercised over the city from the Pavilion. All weights, measures, balances, and ellwands in the seven-league circuit were brought before the justiciaries; those found unjudicially passed were burned, and the men who used such in fair-time fined ‘to the bishop’s benefit.’ At any hour in the day the justiciaries might walk down into the city and taste any cask of wine kept for sale; and if they discovered it to be mixed, stale, or unwholesome, forthwith those casks were hauled out of the cellars and had their heads knocked off, the innkeepers being, as a matter of course, fined also for the bishop’s benefit. Adulteration was not to be lightly practised in those days. Nor were raids on the bakers unknown; my lord’s servants paid visits now and again to the bakers, and carried off a loaf or two of bread—be it noted that the justiciaries themselves were the publicans’ visitors—to the Pavilion to be weighed; ‘and if they prove short, they shall be forfeited to the bishop, and the baker be put in the pillory, or otherwise be fined.’

The Pavilion was also a place of very summary jurisdiction, wherein the justiciaries meted out punishment to dishonest merchants, and to thieves and strolling vagabonds, whom the great fair would undoubtedly bring together in large numbers. It was a ‘Piepowder Court,’ the court having rule over the dusty-foots or pedlars (the

*pieds poudreux*); or, as has otherwise been—probably with less accuracy—asserted, the court wherein justice was done to men before the dust of the fair was off their feet. A dusty-foot was a wandering pedlar who got his living by selling small ware from his pack, and had no settled home. So to Piepowder Court came all delinquent fair-folk; and here, too, were settled all disputes and wrong-doings occurring during the sixteen days in the city, within the seven-league circuit, or in Southampton. It is a curious memory to think of the culprits of the big seaport, and of all the country for ten miles around Winchester, the disputants and the ill-doers, being dragged up to the top of that quiet ridge of downland which overlooks the little city to-day. It will be a matter of future history how, only a year or two since, certain of the citizens objected to the removal to this hill summit of an old Russian gun captured in the Crimea; and how they carried the position by assault one midsummer night, and restored the precious relic to its old proud position in the Broadway of the High Street.

From St Giles’ day, September 1, to September 15, this condition of affairs lasted: the trading and trafficking, the gazing and haggling, and buying and selling in this queer wooden town within its high wooden palings, on the edge of the downs; the merchants bringing in their wares from the ends of the land and from across the sea to ‘Drapery’ and ‘Spicery’ and ‘Pottery’ and other departments of the mart, until the vigil of the Nativity of the Blessed Virgin (September 7), after which date a fine or restraint on his goods awaited the tardy comer; the townspeople passing in and out of the gate that overlooked the town, the country folk swarming through that which led out upon the country—for there appear to have been two exits, both of which were jealously guarded, for fear of the inroads of thieves, or of smugglers slipping in with untaxed goods. The bishop had his stall as well as his customs duties and fines from other dealers; several monasteries dealt in wine and spices; and the foreigners from Normandy and the Low Countries, Poland, and such distant regions, and the vendors and the buyers from across broad English counties, abode gipsy-fashion on the hilltop, procuring their food and drink from the duly licensed ‘lawful and discreet men’ of Winton.

Through the mellow sunshine of pleasant autumn days, and through, also, autumn rains that plashed down upon and into the light tents and booths, and damaged the goods, and made mud-walks of the extemporised streets—until, perhaps, as is so mournfully told of the Westminster fair, the unfortunate dealers had to eat their victuals with their feet in the mire and the wind and wet about their ears—the trade of a district over thirty miles in circumference, and the commerce of one of the greatest international marts of the time, went briskly forward upon St Giles’ Hill, from the hour when the sun climbed the sky each morning of the sixteen days behind Magdalen Hill, down to the hour when he sank below the western ridge. At the end of the long day, the marshal rode forth from the Pavilion, immediately after sunset—about half-past six o’clock—through the streets of the fair, and pro-

claimed that all business must cease and stalls be closed. Nor were any lights or fires allowed at night, except in a 'lamp or mortar,' and wisely, for fire was the most imminent danger that threatened the stores of merchandise within the wooden walls. St Giles' Church perished with the booths in one outbreak; and in another, the same century, an adjacent suburb of the city caught fire from the burning stalls. So the marshal rode up and down the town, as the twilight began to fall, making his proclamation, and the citizens went down the hillside to the quiet, well-high deserted streets of Winchester; and the merchants put up their goods and retired within their booths; and till the rising of the next day's sun, no one but the bishop's officers and justiciaries might move about, on pain of fine, within the fair.

Amid all the changes and chances of England's history for four or five centuries, the glory of the fair survived. Charters and old writers tell us of it; St Giles' Hill reminds us of it, and looks down upon the few shabby stalls and swing-boats that once, in the year invade the High Street and travesty its greatness. But Queen Anne, who stands in effigy beside the quaint old town clock in that High Street, is not more dead than St Giles' fair, and poets no longer sing with Langland, in *Piers Plowman*, 'To Winchester I went unto the faire.'

#### RICHARD CABLE, THE LIGHTSHIPMAN.

BY THE AUTHOR OF 'MEHALAH,' 'JOHN HERRING,'  
'COURT ROYAL,' ETC.

#### CHAPTER XXXIII.—PENTARGON.

THE morning broke after a stormy night, broke wild and haggard. On the horizon a white shimmer under heavy clouds that would not rise, from which fell lashes of dark rain over the light—a shimmer cold and ghastly as that of the half-closed eye of a dead man. The sea raced inland, in rolling piled-up billows, shaking itself, roaring, spluttering, raging, bent on tearing itself to shreds on the cutlass-like reefs, and beating itself to spray on the cuirass-like cliffs that defended the north Cornish coast. The wind had been blowing a hurricane all night, shifting a few points from south to north, but always with a main drive from the west, like the dogged determination of a madman making feints to throw his victim off his guard, but never swerving from his murderous purpose. The sea, heaped together, in jostling billows, was caught and compressed between the horns of Padstow Point and Hartland. In that vast half-moon, walled up to the sky with perpendicular iron-bound precipices, the white horses bounded and tumbled over each other, and rolled and were beaten down in the conflict. They plunged at the barriers and leaped high into the air, snorting foam, shaking their manes, and fell back broken, torn, to be trampled into the deeps by other billows, likewise rushing on their destruction. A vessel that enters within the bow of that vast arc, when the wind is on shore, is infallibly lost, and the *Bessie* on the morning in question had been driven within the fateful limits.

As already mentioned, Mrs Cable's mother was

a Cornishwoman. Bessie Cable had never visited her mother's native county; but an occasional letter, perhaps once a year, had kept up a link between her and an old mining uncle, Zackie Pen-darves, at St Kerian. The man was now dead, and he had left his small savings and cottage to his only known relative, his niece Bessie, whom he had never seen. The bequest came opportunely; for when Richard told his mother of his intention to leave Hanford, she was able to propose that they should migrate to Cornwall and take up their residence in Uncle Zackie's house. What the size of that house was, how much land went with it, in what condition of repair the house was, that was all unknown. Nevertheless, it was a freehold, their own; and the cottage at Hanford was held on a half-yearly tenancy. Richard at once agreed to his mother's proposal. At St Kerian they would begin a new life, leaving behind them all disturbing recollections.

So Richard manned the yacht, and, without altering his purpose to transpire, shipped his family and goods away, sailed down Channel, doubled the Land's End, and was at once caught in a sudden storm. He had never been in these seas before; he knew nothing of the coast save what he could gather from his chart; but he saw that his only chance was to keep out to sea; and all night he struggled to make head against the gale. When the day broke, he saw that his efforts had been fruitless—the yacht had been driven within the threatening horns, terrible as Scylla and Charybdis. Neither Richard nor one of the crew had closed an eye all night; every man's energies had been at full strain. Cable had not been down into the cabin. Whether his mother slept or watched, he knew not; but she was probably aware of the danger. His dear little ones slumbered, confident of their safety whilst the father was in command on deck. They were not afraid of the water; the tossing of the sea did not trouble them. They were accustomed to it, as tiny water-birds. Often, one or other had been taken to the lightship, and had been inured to the roll and pitch of a vessel, and they minded it no more than the baby minded the sway of the cradle. Why should they fear, any more than the baby that was rocked to sleep by grannie's foot? This was their father's great cradle, and the motion soothed their little brains.

All night long, hope had been strong in Cable's breast; he trusted that he had been able to beat against the wind and gain deep sea; but when morning dawned, he saw that their fate was sealed. From the sea, the coast, towards which wind and wave remorselessly impelled the boat, appeared as one sheer wall of rock, nowhere scooped out into harbours, nowhere retreating sufficiently to allow of beach at the feet of the mighty crags. Here and there on the top of the cliffs he could distinguish towers, the belfries of storm-beaten churches, cutting the dawning eastern light. And here and there a seamark, a turret, that indicated, perhaps, the entrance to some tortuous channel cleft in the precipices, into which a boat might wriggle in calm weather, but utterly impracticable in a storm.

The base of the cliffs was everywhere hidden in foam, and the spray that was caught and

whirled about and churned up with the wind, so that nowhere could be distinguished a line of demarcation between sea and land. Water and air were shaken together into a belt of salt mist, impenetrable to the eye. Thus the head of the coast-wall stood up against the dawning light like a mountain ridge whose roots lie buried in curdy morning mists. If he could have distinguished anywhere a sandy cove, he would have run the *Bessie* towards it; but, apparently, there was nothing before her but to be dashed against upright cliffs and go to pieces in deep water.

As Richard stood considering the prospect, and thinking whether it were advisable to run for a circular tower which seemed to indicate the entrance to a port, the mate and the rest of the crew came to him and insisted on taking to the boat. There was no chance for the vessel, none possible; there was one for a small boat, which could feel the shore for a landing-place. If there were a cleft where the tower stood—then a row-boat might be run in; it was more under control than a ship. They wanted Cable to bring up his mother and children and take them along with them. The only prospect of life lay in deserting the *Bessie*.

Richard Cable heard them out, with a frown and set teeth. Then he bade them take the boat and begone. He and his would abide in the yacht and drown together in her. 'You drown your way—and I and mine will go down together our way,' he answered.

Jonas Flinders was one of the crew, and he urged Richard not to commit such a folly, that where there was a chance, he was bound to grasp it; but Richard was not to be moved. He took the wheel and signed the men away.

He watched the crew unswerving the boat, get in, and leave the *Bessie*. He watched them rowing, danced about on the waves, lashed by the spray, and then lost them in the drift. What became of them, he could not tell. It was well that they were gone. If he must die with his darlings, let them die all together, without others by.

That boat never reached the land with its load. It came ashore in chips, and the men in scraps of flesh and bone, literally sliced to pieces on the razor-like blades of slate that ran out from the cliffs into the water.

Richard noticed that a flagstaff stood on a rock near the tower, and he suspected that if there were a channel, it lay between these; but the entrance was masked by an insulated rock standing out of the water like a gigantic meal-sack. He took a piece of rope and lashed the tiller fast, so that the bows were turned directly towards the supposed entrance to a port. Then he went to the ladder leading to the cabin and descended slowly. He was in his dreadnaught, dripping with sea-water, his pilot-hat drawn over his brows, and the lappets covered his ears. When he came into the cabin, it was still dark there; only now and then, through a side-light, came a cold white gleam, and then it was blurred over by gray water. The pendent lamp, however, was still burning; but the oil was almost exhausted and the wick was much charred, so that the light it gave was not bright. It had burned all night. Mrs Cable had not slept all night;

she knew the peril, and she kept watch. Now, all the children but tiny Bessie were awake, and their grandmother was dressing and washing them. Owing to the pitch of the vessel, the operation was conducted with difficulty. Richard Cable stood at the cabin entrance, holding the posts and looking on. His mother was then combing out and smoothing on either side of her ears Mary's golden hair. Little Susie stood with her hands and face wet, asking to have them wiped. Did Mrs Cable know that they were all about to die? She thought it very likely, but she washed and dressed the children as carefully as if they were going to a school-feast. If they must go in an hour before the throne of God, they should go with their hair tidy, with white stockings and clean bibs, and Mary with the coral necklace round her throat that had belonged to her mother.

Richard looked steadily at the group, and said: 'Mother, when we strike, come on deck with all of them, and give me Bessie into my arms. You shall not drown down here, like mice in a cage.' Then with a deep frown he added: 'This also comes of her.'

'Richard,' said Mrs Cable gravely, as she bound Mary's hair behind her head, 'it is not so. Forgive her now.'

'It cannot be.' In a louder tone—'I will not.'

'What! Richard? Not when we are about to appear before the great God?'

He shook his head. 'But for her, this would not have come upon us. Our death will lie at her door; all the miseries I have suffered through her are not enough. She must kill me and mine.'

'O Richard, do not be unforgiving!'

'I thought to wipe out the curse that comes with her name, when I changed the title of the vessel; but the evil clings to us and drags us down.'

'Richard, I once had a bitter wrong done me, worse than any that has touched you; but I forgave.'

'Mother, if this brought me alone to destruction, I could freely pardon; but when it carries along with me you and all—all that I love—I cannot; I will not. If I go to the judgment seat above, I will take all the seven with me and denounce her; and if there be justice in heaven, she shall suffer.' He gripped the rail as he turned and reascended the ladder, muttering as he went: 'I cannot—I will not.'

On deck again, he resumed his place at the tiller, and unlashed it. The *Bessie* was running near the meal-sack rock, at which the waves raced as in frolic, or savagely bent on throwing it over, but instead of effecting this, were themselves whirled as waterspouts high into the air. The rocks in front seemed to tower two or three hundred feet out of the sea. Above them, the sky was brightening and the clouds parting. All at once, Richard saw a fissure in the face of the cliff, a mere rift, impossible for him to strike and pass through. As easily might a man thread a needle on horseback when hunting and the hounds are in full cry. On the left of the ness crowned by the flagstaff, the wall of rock sheered away inland and the cliffs seemed to be scooped out. Cable, with a tremendous effort, wrenched the

helm hard down and brought the bowsprit with a swing round, so that the *Bessie*, instead of running into the cleft, turned, cleared the flagstaff rock, and went on the ridge of a roller into a caldron or cove north of it. He drew his hand over his eyes and wiped the spray out of them, and saw that he had dived into a semicircular bay, walled up to heaven on every side but that by which he had entered, and in which the mad waves were thundering tumultuously. One side of the cove ended seaward in a mighty black headland, that overhung, without a ledge on it where seagull could nest or samphire take root. In the lap of the bay, where the rocks were not quite so high, a waterfall leaped down, and was lost below in the spindrift that filled the air. One moment more and all would be over. He left the wheel and went to the cabin door, and called: 'Come on deck.'

Then up came the children, Mary leading the way, clinging to the rail with one hand, and with the other helping little Martha to mount the brass-laid steps. Last of all appeared Mrs Cable, carrying the baby. As each little head appeared, Richard, who knelt on one knee by the cabin hatchway, helped the child up, and put his arms round it and gave it a long embrace and kiss—the last, he thought, in this world. He said nothing; he could not speak. Bitter in his heart, bitter as the seabrine, tossed the anger against Josephine who had brought this about.

Without a word, he took the babe from his mother, and then Mrs Cable gave a hand to each of the youngest. So they stood, a little group on deck, looking at the remorseless, cruel shore, at the sweep of iron cliffs that engirdled them, about to hug them to death. Though so near, they could not see their feet, hidden in foam and spray. Around them shrieked and laughed the seamews. The wind whistled in the cordage. The water roared and hissed around.

Then Mrs Cable stooped to the children's ears and said something that Richard could not hear; but at once, above the boom of the sea and the piping of the wind, he heard the little voices raised in song:

Shall we meet beyond the river,  
Where the surges cease to roll?  
Where in all the bright For-ever,  
Sorrow ne'er shall vex the soul.

It was a song the children had learned at their Sunday school, a song of which their father was very fond, and which he had often made them warble to him. The poor, feeble, quavering voices were now out of tune and faint, with the wonder and fear that fell on them at the sight of what was before; but they knew that their song would please their father, so they girded up their faltering courage and sang as loud and strong as they could:

Shall we meet in that blessed harbour,  
When our stormy voyage is o'er?  
Shall we meet and cast the anchor  
By the far celestial shore?

And—see! above the head of the waterfall, towards which they were driving, through the rift it had sawn in the rocky wall, flashed the rising sun—it turned the head of the stream, as

it took its final leap, into liquid gold, and the river seemed to pour from the very heart of the sun, bringing fire and life and hope down into the wild, gloomy abyss below.

Shall we meet with many loved ones  
Who were torn from our embrace?

sang the little voices, and stopped—for, from out of the haze that hung between the sea and cliffs, leaped a fiery streak like a flash of lightning, and something flaring, roaring, screaming rushed over their heads; and a moment after, with a sharp crack like the report of a pistol, a rope fell athwart the deck. Those on shore had seen the wreck and had discharged a rocket over her. Richard knew at once that all was not lost. He flew to the rope and made it fast.

In another moment the vessel struck, not on a reef, but on a shingly beach, and at the same moment a great sea struck her on stern and went up in spiral whirl, like a shaving before a plane, and washed the deck. Richard seized his little ones and drew them to him. The wave passed, and none was lost. Then he gave the baby to his mother, and took up Mary in his arms; she clung round his neck, lacing her hands behind, fastening herself to him as a ferret holds to his prey. She was a shrewd child, and she knew what her father was about to do. He needed not to tell her. She put her lips to his cold wet cheek. Then he grasped the rocket rope, and went over the side with her into the boiling foam.

Whilst he was away, Mrs Cable drew the children half down the cabin ladder, where they might be safe from the seas which struck the vessel and swept the deck. Every sea drove the *Bessie* deeper into the shingle and farther up the shore; she was steadied, but exposed to the full force of the waves.

Presently, from out of the leaping water, with the froth dripping from him, came Cable again, clinging to the rope, followed by two men from the shore; and the rest of the children and Mrs Cable were conveyed in safety to land. Most difficulty was found with the babe, as little Bessie could not be relied on to cling. She must be held in one arm, and the rope grasped with the other. Richard would let no one take her but himself, and he succeeded in bringing her through. He was now much exhausted, numbed with cold, and his limbs shook. He would not yield up the child. The danger was yet not over.

The cove into which the yacht had been run was that of Pentargon. It has a small rubbly strand, which can only be reached from the top of the cliffs by an arduous path, which, as it nears the base, passes over shale that lies upon slate-shelves steeply inclined downwards, over which moisture trickles. By this perilous way alone could the little party ascend; by this, with great difficulty, had the coastguard brought the rocket apparatus, when from the lookout they saw the little vessel driven into the cove.

The sturdy coastguardmen gave their hands to the children, to help them to ascend the steep slope over the treacherous shelf, where a fall might precipitate them over a ledge upon the shingle-beach or into the water.

'I will come last, with the baby,' said Cable. So the procession formed. Each must mount

singly, staying up a child. There was nothing to cling to; every step must be taken with precaution in the loose and sliding shale.

Richard held the smallest child well wrapped under his dreadnaught. She was awake, frightened, cold and fretful, and her sobs and impatience at being covered up harassed Richard, already spent with his watchful night and struggles through the waves with the children. He raised the flap of his coat, put down his head, and spoke soothingly to the infant. His voice usually had great effect in lulling her cries when in pain; but it was not so now. Little Bessie did not know what was going on, was drenched with sea-water, and greatly terrified. She could not understand her father, or would not be satisfied.

'It is dada who has you in his arms, Bessie,' he said with his mouth under his dreadnaught. 'Baby will soon be snug in a warm bed, and have hot milk to drink.'

But she strove fretfully in his arms to beat a way by which she might peer out of the wraps, and broke out into shrill screams of pain and anger.

Richard stood still on the shelf, to readjust her in his arms; perhaps, as he held her, her little back suffered, so he altered her position under his oilskin coat. Her cries went through his heart and unnerved him, already shaken and exhausted; cold though he was, he felt hot for a moment with distress and perturbation of spirit.

'Bessie, darling! do be still. Trust your dada a few minutes more, and all will be well!'

But hardly had the words escaped him, when the rubble under his feet slid away on the shelly strata of slate. He fell heavily on his side. He had just presence of mind to fold both his arms round the baby, when he rolled over, and went down the slope and steps of rock. If he were hurt, he felt no pain; his whole attention was engrossed in the child he bore, his whole effort to ward it from blows with his elbows and hands.

In another moment one of the coastguardmen came down to him.

'Bessie is unhurt!' exclaimed Richard, lying among the stones.

'Any harm done?' asked the man. 'Give us a hand. Stand up, mate.'

Cable waited a moment, and moved his elbows, and then said: 'Take her. I cannot rise.'

He had dislocated his thigh.

## NETTLE-CULTURE.

Of late years, it has become necessary to avail ourselves to the utmost of all the resources of the soil in Great Britain, if we are to extricate ourselves from a state of crisis which is daily assuming a more serious aspect. At the present moment, agriculture appears to be in a state of transition. The old routine culture will have to give way to numerous innovations; and it is the duty of the practical botanist to do what he can to help the landowner out of his difficulties, by calling attention to any plants which seem likely to prove a source of revenue. Already we have heard a good deal said about the culture of maize and tobacco in England and Ireland;

and quite recently, it has been shown, by very carefully collected statistics, that flax-culture with us will yield the farmer a net profit of a guinea an acre, or, if he can accomplish the retting and scutching also, an annual profit of at least double that amount. Hemp is another fibre-yielding plant about which we hear far too little, and with which, it is probable, more might be done. Then there are a certain number of herbaceous plants, chiefly annuals, which might prove well worth cultivating as a material for paper pulp; and another series generally termed 'herbs,' which are in constant demand for culinary and medicinal purposes. We will only mention mint, lavender, chamomile, liquorice (only grown in Yorkshire, at present), gentian, rue, hyoscyamus, belladonna, &c., all of which are indigenous, and could doubtless, with proper attention, be made to yield paying crops in various parts of Great Britain and Ireland. The scientific and experimental agriculturist should now turn his attention to these and many other productions of the vegetable kingdom, capable of culture on an extensive scale in our climate, and for which there is a constant and, in many cases, ever-increasing demand in our markets.

In the present instance, we intend to say a few words upon a very humble plant, the mere mention of which may cause a smile of incredulity to arise. Some people imagine that they know all about it; others, that there is nothing worth knowing about it; while many writers have spoken of nettles being 'neglected' plants. Let us endeavour to point out the true state of the case. Before the beginning of the present century, the nettle began to attract the notice of the curious, and there is no 'neglected' plant growing on 'neglected' spots of British soil that has been oftener alluded to by botanical writers as being a 'most useful' plant to those who know how to use it. But with all this, it has never got upon the market, like belladonna, flax, or lavender, for instance; and it may be worth while to inquire into the reason of this.

There are three kinds of nettle in Great Britain, and they are known to botanists as *Urtica urens* (Small Nettle), *U. dioica* (Great Nettle), and *U. pilulifera* (Roman Nettle). The first two are common enough, and will grow anywhere, but appear to prefer localities in the neighbourhood of human habitations, or the outskirts of highly manured fields; for they require much nitrogen, either in the form of ammonia or as nitrates of potash, soda, or ammonia. Hence, nettles thrive very luxuriantly in the neighbourhood of drains and cesspits in the country, where they have good air and a soil rich in nitrogen. To the botanist, these nettles are particularly interesting, from the fact that in one of the species (*U. dioica*) the flowers are incomplete, and separated on different plants—that is, one plant has flowers with stamens only, and another flowers with pistils alone; whilst on the other species the two kinds of flowers are found, though separate, on the same individual. This circumstance would have to be taken into consideration if the *U. dioica*, or Great Nettle, should ever rank as a cultivated plant. Another point of interest is the structure and contents of the hairs of the nettle, by which they inflict a sting. These hairs are long, pointed, transparent cells, swollen out at the base, and

full of a fluid, of which the principal ingredient appears to be formic acid (so called from having first been discovered in the ant, *formica*). When the points of the hairs penetrate the skin, they break, and allow the transparent fluid to permeate the tissue, setting up a smart irritation and itching, and raising small circular tumours. These effects pass off in a couple of hours, or less, as the poison is absorbed and carried away by the circulation.

This stinging effect has frequently been taken advantage of in medicine, when it was thought advisable to produce irritation on the surface of the skin, and it has proved beneficial in allaying rheumatic pains, &c. By constant application, the system may, however, become accustomed to it, just as we find bee-keepers who no longer experience any effects from the sting of the bee. It is *U. urens* which has been chiefly employed thus, whilst *U. dioica* has been mostly used for arresting hemorrhage; and this is a very important use of the nettle. Cotton-wool steeped in the fresh juice of either kind of nettle, and introduced into the nostrils, will stop bleeding from the nose, especially if cold applications to the forehead and between the eyes are used at the same time. In cases of internal hemorrhage, the juice of the nettle has often proved most valuable. Dr Fonsagrives, a year or two ago, told us that one dessert-spoonful of the fresh juice of *U. urens* given once a day for several consecutive days proved rapidly and completely successful in a case of very severe hemorrhage, and he recommends it in all such cases. By soaking the nettle in rectified spirit for a week, and then filtering the solution, Dr Rothe, of Vienna, has obtained a hemastatic preparation, a brownish-green tincture, which possesses in a marked degree the property of arresting bleeding. The principle to which this effect is due has not yet been discovered. In fact, the chemistry of the nettle, if we may so express ourselves, is still very little known. With the exception of formic acid, which was found in the hairs by Professor Gorup-Besanez; the presence in the leaves and stalks of some yet unknown astringent principle; the yellow dye yielded by the roots when boiled with alum; and the green colour resembling the Chinese *Lo-kao*, which was obtained many years ago by Persoz and Phipson, and appears to have been known in Russia previous to the year 1824, we have scarcely any chemical data, properly so called, with regard to these remarkable plants.

However, at the beginning of the present century it was known to country-folk in Scotland that a decoction of nettles with salt forms a kind of rennet that will coagulate milk for making cheese. This property would prove useful in India, where it has been lately proposed, in certain provinces, to use for the same purpose the juice of a plant called *Withania coagulans*; for the use of common rennet is objected to, from religious motives, by the natives of India; hence, they are deprived of the useful art of cheesemaking, unless they can coagulate the milk by means of some vegetable preparation. In Scotland, also, the young nettle-tops are made into a salutary pottage, as Walter Scott remarks in *Rob Roy*, a custom which is probably several centuries old. In Sweden, large crops of the Great Nettle (*U. dioica*) are grown as green fodder; it appears

to be relished by cattle, and has the advantage of being an early spring product, supplying fresh green food when there is no other to be had. In the course of the year, they get one or two more crops of nettles from the same land. When dried—by which process it loses its power of stinging—sheep and young oxen will eat it at any time of the year. A French writer says that fowls will eat the grains and the withered leaves, and that the latter are particularly good for young turkeys.

Nearly two hundred years ago, attempts were made to take advantage of the fibre of the nettle. The plant was treated like flax both in Shropshire and in certain parts of France, and manufactured into a kind of cloth. Although this has been since superseded by cotton and flax, the attempt is again about to be made in Germany, where an energetic lady has recently persuaded several agriculturists to put a certain number of acres under nettles, with the view of testing the quality of the fibre produced under the best conditions of culture. We shall await the results with some interest. Meantime, in France, while flax and hemp have long since caused nettle fibre to be discarded, the latter plant has been frequently used in paper-making.

A good deal might be written about the yellow dye from the root of the nettle, and the green material which results from a peculiar fermentation of the leaf and stalk; but, since the discovery of the coal-tar dyes, those derived from plants directly have become in almost all cases of very secondary interest. Even madder and indigo can scarcely compete with the artificial products of the chemical laboratory.

There is another point, however, in the history of the nettle that perhaps deserves some attention. It was known as early as 1820 that these plants contain nitrate of potash or saltpetre; and some writers have stated that they will only thrive where they find abundance of nitrate of potash in the soil. It is quite possible, however, that the nettle manufactures this salt from the ammonia which it derives both from the air that passes over its leaves and the water which moistens its rootlets; hence, the practical question arises, whether nettles could not be made a valuable source of saltpetre? It is a question that would be well worth investigating by those who have the means and the necessary talent at their disposal.

In spite of the culture experiments now being made in Germany, we have not much hope that nettle fibre will ever again prove a substitute for either hemp or flax in this country; the more so as another plant of the nettle tribe, known as Ramie, a Chinese vegetable belonging to the genus *Behmeria*, which the English now call 'grass-cloth plant,' is coming very prominently forward (see *Chambers's Journal*, No. 129). There are several species of these exotic nettles in Assam, Nepal, the Sandwich Islands, and Brazil, and in all these districts they are used in the manufacture of textile fabrics. The Ramie of China is known to the natives as *Tehou-ma* (*Behmeria nivea*), and attempts are at present being made to introduce it into France. The Chinese obtain three crops of stalks in the year. The fibre is procured by stripping off the bark in two long pieces from the full-grown plant, which is three or four feet high, scraping these pieces with a knife, to get rid of

useless matter, and then dividing the strips into fine filaments by steeping them in hot water or holding them in steam.

It remains to be seen whether or not our common nettles, submitted to appropriate culture and treatment, could be made to yield a fibre in every respect as good as that of the exotic nettle just alluded to; and if not, whether it might not prove profitable to introduce this exotic nettle into our own country—that is, into certain districts of Great Britain and Ireland where it would doubtless thrive.

## A MATTER OF CONSCIENCE.

IN THREE CHAPTERS.—CHAP. I.

SIX o'clock on a November morning at Tynemouth. All night a heavy gale had blown from the east, driving before it the cold gray waves of the North Sea, and piling them upon the bare coast of Northumberland. Their foam flew up over the low cliffs, and mingled with the chilly sleet, dashed against the windows of the houses built on the verge, making every separate pane of glass rattle in its fastenings. A bleak morning truly, and one on which even the stern medical professors, who are so fond of warning us against the comforts of life and their enjoyment, could not but have allowed that, till daybreak at least, bed was the best place for a tired man. So thought Dr John Wynyard, as he half awoke from his sleep, heard the noise of the wind and rain with a feeling of blissful enjoyment of the contrast, and turned on his pillow, to fall anew into that morning slumber which is the most enjoyable of all.

But the thought of the wild weather without had entered the secret chambers of his brain and set him dreaming. In his dream it seemed to him that he rose and looked out of the window towards the old priory and its wave-worn peninsula of rock; and there he saw a strange sight—a gravestone was approaching the edge of the cliff with a slow, stately, gliding motion. Not a pause it made, but continued its course down the slope and into the foaming caldron of water that boiled beneath. Another and another followed. It seemed as though the whole of those sad memorials had grown tired at last of standing in the cemetery, recording on their faces the false praises of the dead, which kindly hands had graved upon them, but which were none the less lies. 'Faithful and loving wife'—'Tender husband and father'—'Dear and only child.' It was all very well to say so, when they were gone; but would any have said such words of them while they lived? Here, in dreamland, where all things are possible, it seemed scarcely strange that the very stones should have rebelled at last, and be ready to hide themselves for ever under the ocean. A wild strain of music seemed to keep time to their stately march towards oblivion, rising and falling, as though the storm played upon the strings of a great Æolian harp.

'I wonder if any stones will be left—if even one bears a true inscription?' Wynyard thought, and woke, the question remaining unsolved.

As his senses came back to him, he became aware of the unpleasant fact that the sound which his sleeping imagination had exalted into music

was merely a persistent whistling from the speaking-tube which terminated in the wall close to the head of his bed. Evidently, he was wanted; and the idea of turning out breakfastless into the howling storm that still raged without, was not a pleasant one. However, with a sigh of resignation, he withdrew the wooden stopper from the tube and called down it to know what was the matter.

'Captain Brock, of Cullercoats, seriously ill; wants to see you at once—carriage waiting for you at the door,' were the words he heard. The doctor promptly jumped out of bed, and prepared to dress himself with as little delay as possible, after shouting down the tube that he would be ready immediately.

'They must have sent a sensible man for once,' he mused, as he fumbled at his collar stud, which was always slipping out of its proper place. 'Some fellows would have insisted on giving me a complete history of the whole business from beginning to end.—But what on earth can Captain Brock want with me? I have not been attending him, and Cullercoats is not in my practice. It may be a good opening for me, perhaps. Who knows? I have not done so well here that I can afford to throw away any chance that offers.'

Being a thoroughly practical man, he thought no more of his dream, by which a more imaginative mind might have been impressed, but hurried on his clothes, and in ten minutes from the time of the summons was in the carriage and driving along the cliff towards Cullercoats, a little village within a mile of Tynemouth.

Captain Brock's residence was a semi-detached house, forming part of a terrace which was in rapid process of construction, the builders having hopes that they would succeed in due time in making Cullercoats the watering-place for the north, in place of Tynemouth, where the visitors found the cloud of smoke that drifted over land and sea when the wind blew down the Tyne, a great drawback to their enjoyment. Wynyard lived in a very similar house himself; but in his case it was from sheer necessity; and he wondered, as he entered the hall and saw the painful newness of everything, that any man of private means should care to settle down in such a dwelling.

It was still dark, and the dawn had only just begun to break as he entered the house. Gas had not yet been laid on in the new terrace; but its want was supplied by a large bronze lamp which stood on a pedestal in the hall, and by its light the doctor saw that some one was there to receive him. It was a girl of some twenty years of age, clad in a close-fitting gown of blue serge, relieved only by a gleam of white linen at wrists and throat, and by a simple though valuable brooch, which fastened it at the neck—a single large opal set in a thin rim of plain gold. Her figure was decidedly beautiful; but so much could not be said for her face, which was spoiled by the heaviness of the lower part, chiefly caused by the squareness of the jaw and chin. However, if not beautiful, it was eminently a good face and a pleasant one; and the doctor, who was no mean judge of physiognomy, thought he had rarely seen a countenance more to be trusted. She bowed slightly to him as he entered, and said, coldly enough, yet with a ring of feeling in her voice

which showed that she was repressing some emotion: 'You are Dr Wynyard, I suppose? Will you kindly come up-stairs? My father is very anxious to see you at once.'

Wynyard bowed, and followed her, asking as he went, how Captain Brock was and what was the matter with him; to neither of which questions did he obtain a very satisfactory answer from the lady, who seemed unwilling to say more than she could avoid.

Captain Brock's chamber presented the scene that all doctors know so well, when a man is taken suddenly ill. The Tynemouth lawyer stood beside the bed with a bundle of papers in his hand. An old woman, called in to assist in the nursing, was making up anew the expiring fire in the hearth; and on the pillow lay a white face with bushy black beard, the eyes closed, and the breath coming in gasps from the pale lips.

At the noise of the opening door the lawyer looked round, and the sick man opened his eyes. Dr Wynyard approached the bed and prepared to feel the pulse of his patient; but the latter made a motion of dissent. 'That will come later, doctor,' he said slowly and painfully. 'You cannot do me much good now in your medical capacity; but as a man you can. Come nearer and let me have a good look at you.'

Wynyard obeyed; and the sick man gazed into his face for a while with an intensity that in any other circumstances would have approached madness.

'He will do!' Captain Brock muttered, half audibly. 'A good face—just such a one as I expected him to have.—Doctor, I want a few words alone with you.'

The other occupants of the room went out at this, and Wynyard was left alone with the dying man; for dying he was, as the doctor's experience told him.

'Lock the door,' said Captain Brock. When he saw that this was done, he put his hand under his pillow and drew out a long parchment envelope, holding some thick document, and laid it on the table beside him. 'Dr Wynyard,' he said, 'I am going to ask a great favour of you—greater than any man has a right to require of a stranger. But I know you, and I have studied your face and your life, and I believe you to be an honest and upright gentleman, who will not mind trouble for a good object, and will espouse the cause of the fatherless. Am I not right?'

'I hope so,' said the doctor simply.

'Well—I have no relations living except my daughter, and no friends either,' said the captain, with some bitterness. 'I am only the retired master of a merchant vessel, as no doubt you know; but I have saved enough money to keep Mary from starving at all events; so, even if you fail in the work I want you to undertake, no very great harm will be done; still—— His voice failed him a little, and he reached over to the table for a cup standing there.

Wynyard smelt the liquid it contained and shook his head, but passed it to him. He drank eagerly, and seemed revived by the act.

'Dr Wynyard, I have made you executor of my will, and trustee for my daughter till she come of age. You will hear all about that when the will is read. Promise me that you will accept the trust. It is a dying man that asks you.'

'But surely you might have found some one more competent than I am to undertake it,' said Wynyard, rather dismayed at the prospect before him. 'I assure you I know nothing whatever of business.'

'So much the better, sir—so much the better. You can be trusted, and that is all I want. But I know you will not fail me.—Here is a sealed letter that I want you to take at once; but do not open it till after the will is read. It will give you full instructions as to the work I want you to do. You shall not be the loser, sir.'

His voice had been growing weaker as the influence of the stimulant he had taken left him, and now he sank back on the pillow, livid and breathless, but pointing to the paper that lay on the table. Wynyard took it up and put it in the breast of his coat. The dying man gave him an eloquent look of thanks, and then relapsed into the state of torpor which is the last symptom of that terrible disease, inflammation of the lungs. Wynyard hastened to do what he could for him; but the case was hopeless, as he had known long before. Captain Brock never spoke again in this world.

Wynyard, with the lawyer's assistance, gave what directions were necessary for the funeral and the care of the house for the next few days, as Miss Brock was quite incapacitated from attending to such matters. She did not weep or show violent emotion; but the doctor knew well what her pale face and compressed lips meant, and pitied her all the more for her gallant effort to hide her feelings from strangers. He knew that sorrow would find its natural relief in tears when she was alone again, and hastened his departure as much as he could—a delicacy of feeling which the girl fully appreciated, and was grateful for in her own shy way.

Like a sensible man of the world, Dr Wynyard determined to keep his mind as clear as possible of Captain Brock's business until he should be able, after the funeral, to see what was in reality required of him. Nevertheless, it must be owned that his mind was not altogether free from misgivings as to his very delicate position of trustee to a young lady of twenty years of age. However, trustee did not necessarily imply guardian, and he hoped that the old captain had seen the necessity for appointing some sober matron to act in the latter capacity. Meanwhile, he thought it kinder not to disturb Miss Brock in her first grief, knowing that all possible arrangements had been made for her comfort so far as the present was concerned.

It was a clear frosty day when the funeral procession wended its way along the cliff and through the castle gate to the old priory cemetery. Procession we have called it; but perhaps that may be too grandiloquent a word to use when speaking of the little knot of mourners who followed the body of the old captain to its last resting-place. His words as to his loneliness in the world seemed true enough, for no relatives had come to attend the funeral or hear the will read. Miss Brock, somewhat in defiance of the custom of the place, was present at the ceremony, and from underneath her thick crape veil, a tear or two rolled down, which made, as Wynyard thought, remembering his dream, a better epitaph after all than any carved in stone; showing as

they did that the dead was at least regretted by one person on earth; and that, after all, is something.

After the funeral, the clergyman, lawyer, and doctor, with Miss Brock and the servants of the household, met in the parlour of the dead man's house to hear the will read. The newness of everything, furniture, house, and fittings, seemed sad in its strangeness of contrast with the duty on hand, and the girl clearly felt it so. Wynyard watched her pityingly as the lawyer read the long preamble of the will, knowing that his attention would not be much needed till the enumeration of the captain's worldly goods was over. At length came the gist of the document, and he listened with all his ears:

'And all the above personal property, of every nature whatsoever, I bequeath to John Wynyard, Esq., Doctor of Medicine, of Tynemouth, Northumberland, in trust for my only daughter, Mary Brock, till the said Mary Brock shall reach the age of twenty-one years, when she shall come into personal possession of the same. And I appoint the said John Wynyard guardian of this my daughter; and do will that he expend what money he considers suitable in providing for her subsistence and education during her minority; and for his trouble in the matter I give and bequeath to the said John Wynyard the sum of One Thousand Pounds, free of legacy duty.

'And I hereby request the said John Wynyard forthwith to sell out all stocks, bonds, and other securities standing in my name, and to invest the money realised by the sale of the same in the shares of a certain Company, the name whereof is duly shown in a paper signed by me in the presence of witnesses and handed over to the said John Wynyard. And no impeachment shall lie against the said John Wynyard for any loss arising from the aforesaid investment,' &c.

'A most extraordinary will, Dr Wynyard!' said the lawyer, as he folded up the document slowly. 'I am not at all sure that it would stand, if any one chose to contest it. He sent for me the night he died, to read it over, to give him my opinion upon it, which I did pretty freely—but to no effect. I suppose you are going to act, and that you have got the document he speaks of?'

'Yes,' answered Wynyard to both questions. 'But I foresee that I shall have to ask your advice, Mr Walker, as I really know nothing about business.'

'Very well,' said the lawyer. 'You will always find me at home from ten to one; and when you come, don't forget to bring your document with you. A great deal may turn upon that.—Good-bye, Miss Brock. I will leave you to talk over matters with your trustee.' And he lifted his black bag and hat from the table and left the room, followed at once by the clergyman and the servants—the latter in high good-humour, having been mentioned in their master's will for small sums, in spite of their short service with him. Wynyard and Miss Brock were left alone in the parlour.

The situation was decidedly an awkward one, and the young doctor had no idea how he should begin the necessary conversation. The girl, however, saved him the trouble. She raised her veil, and looked steadily at him for a moment, and then spoke in a voice not altogether free from

tremor: 'Do I understand, Dr Wynyard, that you are appointed my only guardian?' She did not emphasise the word 'only'; but the direction of her thoughts was evident, and Wynyard hastened to answer.

'Your only *legal* guardian, Miss Brock.—But I have full liberty to use as much of your money as you may require in providing you with a suitable home and congenial society. Would you mind telling me what your plans are for the future?'

'I have none,' said the girl slowly. 'I do not think I have a relative living. I was brought up in a convent at Brussels while my father was at sea, and scarcely saw him except in very brief visits, till he retired from the service six months ago and brought me here.—Where do you think I had best go now? I could not live here by myself—could I?'

'Not well,' said Wynyard, looking perplexed. 'I suppose you would not care to go back to the convent for a year?'

'Not, if it can be helped,' said the girl, with a quick contraction of her brows. 'I was not happy there.'

'Well,' Wynyard said, as a sudden thought struck him, 'perhaps you had better stay here for a day or two, and I will try to make arrangements.'

'I am afraid I and my affairs will be a great trouble to you,' she said, with a little pitiful smile, which made the doctor's heart go out to her in sympathy. 'I will do anything you think best; and'—here she hesitated, and a blush covered her forehead—'could you let me have a little money if I am to stay here? There are some bills due to the tradesmen, and one of them came this morning and was troublesome because I could not pay him.'

'What was his name?' asked Wynyard quietly.

'Oh! Heaton the butcher.—But I will pay him myself, if you give me the money; you need not trouble to do it.'

'I will pay *him* myself,' said Wynyard; 'you can pay the others if you wish.' And he opened his purse, and produced a number of sovereigns therefrom and laid them on the table with a keen sense of the absurdity of the situation.

'Thank you,' said the girl simply. 'I will keep a careful account. There is more there than I shall want, I am sure.'

'I hope it will not be many days before I can bring you certain news,' said Wynyard, shaking hands with her. 'Meanwhile, if you have any difficulty and want advice, write me a note. Here is my address.' And handing her one of his cards, he left the room.

## WISE SAWS AND MODERN INSTANCES.

THE good old-fashioned days of agriculture are gone, and the old order has given place to a new, and may be one more go-ahead, but less money-making; yet, for all this, the annals of our ancestral heroes of the soil, of their mode of life and simple faith, will never be lost. In a pursuit like that of farming, so completely dependent upon the weather, that even now, with such powerful allies as steam and ensilage, a few tempestuous hours are sufficient to mar or defer the work of weeks, there is a strange sameness of

yearly routine in the operations of ploughing, sowing, feeding, mowing; and all radiating, in bright or sombre degrees of success, from their common centre, the weather. There can be little wonder, then, if past generations of the inhabitants of our more purely agricultural districts have given more than mere passing attention to meteorological observations; and we have, accordingly, the result of their constant notings down of fitting times and seasons, of portents, warnings, and homely saws, in the numerous doggerel verses which have been handed down from generation to generation, and which are still familiar to many of us. Of these rhymes, many possess reason; others are mysterious until closely studied, when they will be found to teem with both meaning and wisdom. Others there are, lacking both these last-named attributes; but these are the exception. While, on the other hand, nearly all are too full of rustic simplicity, or of that sublime faith in the ways of providence, so long the ornament of our peasantry, to be allowed to lapse into oblivion.

Some English counties are especially noticeable for their numerous homely or weatherwise proverbs—perhaps the more prominent being the eastern counties; while Leicester, Derby, and Cambridgeshire are also most prolific of them—the last-named county probably occupying the premier position among all others. Necessarily, many of these old saws relate to the cultivation of corn; and it was ever thus; for many a line of Virgil's *Georgics* is nothing more or less than an agricultural proverb treated in that tuneful method so peculiarly his own. Doubtless, readers of this poet's minor work can easily call to memory adages quite as forcibly expressed as the following:

Drunk or sober,  
Sow wheat in October.

Or:

When the oak is gosling gray,  
Sow your barley night and day.  
But when the blackthorn's white as a sheet,  
Sow your barley dry or wet.

At this last juncture, it becomes imperative to hasten such operations.

Now that we have touched upon some of those relating to corn-lore, it may be well to continue such sayings.

Some of the different rules for seedling-time are put forward in the subjoined forms—such as:

Sow wheat in the slop,  
And 'twill be heavy at top.  
Sow beans in the mud,  
And they'll come up like a wood.

To this a rider is appended:

But sow  
One for the mouse, one for the crow,  
One to rot, and one to grow.

A very forcible reminder is that which tells us that

Peas and beans should be so thin  
That a ewe and her lamb may lie between.

This is, however, going a little too far to be reliable.

We next come to one of those which we have described as possessing both rhyme and reason, for, with reference to one of the pulses just mentioned, it is said that

If on Candlemas day the thorns hang a drop,  
Then you are sure of a good pea-crop.

On consideration, we shall find that the salt haze of a fog, which at times prevails along our eastern coast, is most beneficial to the seed, acting as a manure upon it.

Barley is now pronounced by judges to be the English farmer's main crop. Accordingly, we are warned that if we

Sow barley in wet,  
But little we'll get;  
But sow it in dust,  
And our barns will bust.

For barley, being by nature a seed which quickly germinates, when retarded in its growth by stiff damp soil, is sure to rot in large quantities.

By the assertion that 'a bright Christmas brings a light wheatsheaf,' may be meant the possibility of a very clear frosty time at that date proving too severe even for this hardy plant. From Kent comes a hopper's ditty:

First the flea, and then the fly,  
Then the louse, and then they die.

If we remember aright, this was quoted in the course of the hop duty sessions in parliament 1861. The correct season for oat-sowing is duly chronicled:

He who would fill his pouch with groats,  
In Januair must sow his oats.

Our three next distichs hail respectively from Derby, Cambridgeshire, and Norfolk:

When the cornerake begins to grow,  
Then your hay is fit to mow.

A wet May and showery June  
Bring all crops into tune.

When the dow [pigeon] doth croak,  
The winter is broke.

These, and many like them, are more or less memoranda on the subject of corn-culture; but there are in addition many general morals bearing upon rural thrift and industry, in the shape of such sound rules as—

If you would wish the world to win,  
Keep neither howling dog nor crowing hen;

for, to thrive, one ought never to keep anything—or do anything—which is at once useless to one's self and annoying to neighbours. It is now more than ever necessary that

The farmer should have on Candlemas day  
Half his turnips and half his hay;

for with the grazing of stock alone to fall back upon, at present corn prices, it is desirable to keep a fair quantity of stock during the long spring months.

We opine that the well-known,

When the wind is still,  
The weather is never ill,

only holds good for a portion of the community; for, in the flooded Fen districts, drained largely

by windmills, a good breeze is looked upon as a blessing. The saying must have originated in some dry upland corner.

Melancholy truth tells us that,

When cockle's mixed in wheaton corn,  
And spurred is the rye,  
Though many in that year be born,  
More in their graves will lie.

The growths mentioned are to be seen in a very wet and cold season—like those of 1877-1879—bad alike for corn and man. 'Spurred rye' means the black excrescence from the ear, producing the drug 'ergot'. This, when ground, of course impregnates the meal with an infinitesimal portion of poison.

We are told that there are different degrees of proficiency even in the henwife's task :

On Candlemas day, the good housewife's geese lay ;  
On Valentine—yours and mine.

As the advent of the cuckoo finds the season backward or forward, so will the prospects of keep for stock, and probable rise or fall in prices of corn, vary ; so that,

If the cuckoo lights on the bare thorn,  
Sell your sheep and keep your corn ;  
But, when he lights on the blooming hip,  
Sell your corn and keep your sheep.

Amid all the hard work entailed on agriculturists, we learn that there will come a time of jubilee, since

He that would thrive  
Must rise at five ;  
He that hath thriven  
May rise at seven.

Housekeepers ought to bear in mind this sound maxim when making provision for Christmas fare :

On St Thomas the divine,  
Kill turkeys, geese, and swine.

St Thomas's day is the 21st of December.—Now for a little advice as to furrowing, fuelling, and the avoidance of spring illnesses :

Plough deep while sluggards sleep,  
And you'll have corn to sell and keep.

Burn ashwood green,  
'Tis a fire for a queen ;  
But, burn it sear,  
And 'twill make you swear.

Ere May be out, cast not a clout—

that is, doff no thick winter clothing. A solemn note of warning is struck in quoting :

March will sarch ye ; April will try ;  
May will tell ye whether ye'll live or die.

In short, there are no end of these amusing reminders ; but we must finish our imperfect sketch with three, quoted respectively for the felicity of the would-be weatherwise, the non-abstainers, and, lastly, for the ladies, namely—

Bright-tailed rain makes fools fain—

that is, rain succeeded by sunshine deceives the non-observant into the belief that instead of a renewal of the shower, there will be fine weather.

He who would keep his father's lands,  
Must wash his throat before his hands.

The extent of the potatoes being thus limited by

personal cleanliness. Lastly, there is annual testimony to the fact that

March winds and May sun  
Make linen white and fair maids dun.

### A TALE OF THE GALTEE MOUNTAINS.

IN the early part of the year 1867, I was travelling on business in the south of Ireland, and one evening found myself in a small town on the borders of the counties of Cork and Tipperary. The country was just then very unsettled, and the trading classes uneasy, the wildest rumours being afloat respecting the impending Fenian insurrection. The telegraph wires between Dublin and the south were cut ; the insurgents were in possession of Cork and Limerick ; shiploads of men were on their way from England and America to aid the rebels—such were some of the canards that spread alarm through the district in which I then was.

I believed only a small portion of these reports, but enough to make me uncomfortable ; and I determined to return to England at once. There was no vehicle to be obtained, police officials and newspaper correspondents having hired them all ; but as my host promised to send on my luggage in a day or two, I did not hesitate to face on foot the distance between my inn and the nearest railway station, which, by a cut across the hills, was, I was assured, only four miles away. I set off, then, on the morning of, I think, the 5th of March. The sky was overcast, and a keen east wind made my ears and cheeks tingle. The half-clad *gossoon* who served me as guide for a part of the way trotted at my side, his hands thrust into his pockets, his neck and bosom bare, his trousers admitting the air by a score of rents. He had quite a budget of intelligence about the 'boys,' as the Fenians were popularly designated, and dwelt with pride on the fact that he knew many of them. Were they dangerous ?—'O no !' he replied, laughing at the question. 'Tis only polis an' sojers they'd shoot ; they won't harm any one else.'

With this grain of consolation, I parted from my guide at the foot of the Galtee Mountains, and climbed the narrow pathway which he called a 'road.' Little round stones slipped and rolled beneath my feet ; in some places the path passed by the brink of depths where a fall would certainly be fatal ; in others, it crossed the side of steep slopes where it was difficult to maintain an erect position. At length I reached the top, and congratulated myself on having accomplished the most difficult part of my journey.

Far below, the path could be seen winding like a gray thread. As my guide said, I could not miss it. Snow now began to fall, slowly, softly, silently, shutting out the plain, and gradually narrowing my horizon, until I could only see a few yards around me. The path was soon obliterated, and the ground became slippery. However, feeling sure that I knew the general direction of

the road, I went forward confidently. But it gradually dawned upon me that I had lost my way, and I looked anxiously round for some sign of human life.

I wandered on for some time, now plunging into a pit filled with snow, now stumbling over some hidden stone, and at length, when almost exhausted, reached a cabin, where I resolved to seek shelter. Standing near the head of a steep glen, the house rested against the side of a cliff, which sheltered it, while helping to support the wooden roof. Though the cottage was diminutive, it looked clean in its fresh coat of whitewash; and a slender column of smoke suggested warmth and food.

In reply to my knock, a woman of about fifty opened the door and bade me enter. She was tall, with good features, and an air almost of refinement. Her black cap and dress were fresh and neat; her manner was reserved, though kindly, and the house was as clean as such a dwelling could be. But in the damp earthen floor and walls, in the meagre furniture and the woman's deeply lined face, there was evidence of poverty and care. I told her my story, and begged permission to rest for a while.

'An' welcome, sir,' she said, drawing to the fire a rush-bottomed chair and desiring me to be seated. 'I am sorry, sir, that I have little to offer you to ate, but'—

I hastened to assure her that I was well supplied; and emptying my haversack on the table, showed that dearth of food was not likely to cause me anxiety. It turned out that I was only three miles from the railway station, to which a good road led; and my mind being relieved on this point, I proceeded to make myself comfortable. We talked of the insurrection; and she was much put out when I spoke of the rebels' defeat as certain.

'Thin you don't think the boys will win, sir?'

'Impossible,' I exclaimed. 'They are madmen to attempt it.'

'I suppose you're right, sir,' she sighed. 'This is the second risin' I've seen—me poor husband was out in '48—an' no good can come of 'um. Poor lads, to throw away their lives so foolishly.—What's that?' she asked suddenly; and seeing her strain her ears, I too listened, and heard a dull tramp and the confused sound of many voices. My hostess sprang up, filled with animation, and hastened to the door, saying: 'Tis some o' the boys!'

About a score of men were scaling the height before the cabin; and when they neared the woman, she addressed them in Irish: 'How goes the cause?'

'Badly, missus,' one of the foremost replied. 'The game is up, an' I daresay the sojers is at our heels.'

The party advanced stragglingly, and entered the house without ceremony. All appeared to be of the humbler classes—small farmers, labourers, artisans—and were miserably armed. There were a few revolvers and rifles among them; but old

muskets, swords, even scythes tied to staffs formed the bulk of their weapons. Their leader wore a red sash and sword-belt outside a green uniform, and above his hat a large plume waved. He was a handsome soldier-like man, and seemed worthy of a better command. In the rear, one of their number was borne on hurdles.

When the men saw me, they stopped, and questioned the hostess suspiciously. A few words sufficed to satisfy them, and they proceeded to make themselves at home. A heap of peat that stood beside the hearth was thrown upon the fire, and a bright blaze soon danced in the chimney, and lit up the forms of the men, who, crowded as closely as possible, sat or lay around the fire. The woman of the house was activity itself. She filled a large pot with potatoes, and set them to cook, afterwards spreading on a table her little store of eatables. Then she attended to the person who was injured. He was a low-sized, slender lad of fourteen or fifteen, who now lay on the only bed of which the cottage boasted. His face was pale, and his features were distorted in an effort to suppress the cry of agony that rose to his lips. The lad's pain arose from a sprained ankle; and when the foot was relieved from the pressure of the boot and wrapped in wet flannels, the boy uttered a sigh of relief.

The majority were a rough wild lot; but I was interested by their chief and by this boy. The former sat apart, his dark handsome face wrapped in gloom, his hands toying with the knot of his sash, while he looked thoughtfully at the ground. The boy was apparently ignorant of the oaths and jests around him; eye and ear were on the alert, his glance being fixed on the window, through which he commanded a view of the high ground outside.

I soon found that I was the subject of conversation between two or three of the party, one of them, a tall, burly, black-browed ruffian eyeing me in no friendly manner. 'Where may you be from, stranger?' he asked.

'London,' I replied briefly.

'I told you so,' he said, turning to his comrades. 'I knew he was a Sassenach, an' curse me if he stays under the same roof as us!'

'You're right, be jabers!' cried another. 'We'll have no Saxon spies here!'

I must own to having felt uncomfortable, and I said in as conciliatory a tone as possible: 'Gentlemen, if my presence is objectionable, I shall leave.'

'How polite you are,' said the first speaker, with an oath. 'Lave you to go and tell where we've gone? Not likely.—Look here, boys; suppose we tie him up and throw him into the pigsty? It will be good enough lodgings for the English baste.'

I sprang to my feet, seeing the fellows about to carry out the proposal; and fearing that their violence might proceed to fatal lengths, I snatched up a sword that one of them had laid aside, and said that whoever approached me would do so at his own risk.

The leading ruffian grinned, and quietly pointing a musket at me, said: 'Put down that sword before I say three. One, two'—

'Lower your weapon, sir!' came like a trumpet-blast from the corner where their chief sat. Up to that moment he seemed ignorant of what

passed around, but he now stood erect, his eyes flashing indignantly. 'Leave that man alone,' he continued; 'we are not murderers.'

'Oh, begorra!' the other replied, 'we're all captains now, an' there's no master here.' He again pointed his gun at me, which he had for a moment lowered.

'You scoundrel,' the leader rejoined, 'you'll be in the dock soon, and will have enough to answer for without adding to it the blood of an innocent man.'

The eyes of all were fixed on my assailant. Those who formerly encouraged him, less ruffianly or less daring, fell back on hearing their captain's voice; but this one appeared quite unmoved. The woman of the house sat in a corner, her apron thrown over her head, in order to shut out the bloody scene that was, she believed, imminent. The lad looked on with dilated eyes, his lips parted, and his breathing almost suspended. I mechanically clutched the sword, and kept my eyes fastened on the trigger of the musket, which the man's finger pressed.

'Put down the sword,' he repeated, in a low hoarse voice. 'One—two'—

I closed my eyes and muttered a prayer. For an instant I hesitated whether to comply or to make a dash for the door. A loud report nearly deafened me; there was a scream; and on opening my eyes, I saw my assailant dancing about the room, swearing furiously, and nursing his right hand, from which blood poured. The leader stood looking sternly at his wounded follower; and the sight of a revolver, still smoking, in his hand told me to whom I owed my life. There was not a murmur heard, even the ruffian whose murderous designs were frustrated, after the first outburst, writhed in silence.

'My good woman,' said the chief calmly, 'perhaps you will be kind enough to give that rascal some old linen and help him to bandage his hand.'

While my hostess was engaged on this task, two of the men who had been placed as sentinels outside rushed in. 'The redcoats are comin'!' they cried. 'There's cavalry there too, an' some o' the boys are runnin' this way.'

In an instant all was wild confusion. With a cry of alarm, my would-be murderer fled, completing the wrapping of his wounded limb while running. He was followed by several others. 'Strain the praties!' cried some of those who remained; and before many seconds, the huge pot was taken from the fire, the water drained off, and the half-cooked potatoes divided among the hungry rebels, who thrust them into their pockets and hats, burning their hands, and dancing with pain. The chief was the last to leave the house, after committing the boy to the woman's charge. While he divested himself of his plume and sash, and put on a large overcoat that one of his followers left behind, I thanked him for his timely intervention on my behalf.

'Pray, do not mention it,' he said with a pleasant smile. 'Had I stood by quietly, I should have been as great a villain as the officer.'—Farewell!

The lad was terribly frightened. 'Oh!' he sobbed, 'if I could only run! But I can't, an' they'll ketch me an' hang me.'

My hostess was hardly recovered from the

stupor into which she was thrown by my peril, and she now looked around with dull eyes.

'Can we do nothing to save this poor boy?' I asked.—'Why not say he is your son?'

'Of coorse, of coorse!' she answered, her face lighting up with intelligence.—'Rest aisy, darlin', she continued; 'no wan'll hurt a hair o' yer head.'

I corroborated this, and the boy was comforted.

'Why did you join those men?' I asked.

'Me father was with 'um, sir.'

'Is he killed?' I went on.

'No, sir; oh, no!' the lad replied with a look of alarm; 'but we lost wan another.'

'What's yer name, *alawunnah*?' inquired the woman.

'Patsy Ryan, ma'am.'

Her face became dark, and she started back from the bed, over which she had been leaning, asking in a cold hard voice: 'Where d'ye come from, good boy?'

'From Tulla, ma'am, three miles th'other side o' Doneraile,' the lad answered, puzzled by the change in her manner.

'Is foxy Pad Ryan yer father?' she almost screamed.

'Yes, ma'am,' was the faltering reply.

The woman became frantic. 'Cursed brood!' she shrieked, 'that brought nothin' to me an' mine but misfortune! Whelp of a vagabone assassin an' parjured informer, come till I give ye to the polis, an' put ye in a fair way o' bein' hanged!'

She seized the boy by the shoulders, and before he could resist, dragged him from the bed, and they struggled together for a moment on the floor. I raised the woman and drew her away, remonstrating and entreating meanwhile. She turned on me like a fury, and snatching up an axe that stood behind the door, rushed towards me, wielding the weapon, while her eyes flashed and her lips quivered.

'Don't come between me an' me revinge!' she cried. 'D'ye know who led me husband into crime, an' falsely swore him to the gallows, who broke me heart an' ruined me life? I'll tell ye—foxy Pad Ryan. An' whin I have his son here in me power, who'll say I mustn't have blood for blood?—I followed me darlin' Dan to Cork jail, an' saw him brought out tied with ropes, an' thin they strangled him to death. An' whin I come home, I found me baby dead from cowl'd an' hunger; an' I knelt down an' prayed that the curse of all the saints might attind the villin who brought the desolation on me house.—An' here's his son, an' I'll folly him to the gallows too!'

Exhausted by passion, she dropped into a chair, still holding the axe, and looking threateningly on the boy, who had crept back to bed, and now lay gazing in terror at the woman. We heard voices outside, and all three turned towards the window. The snow had ceased, the air was clear, and the sun shone coldly on the white-robed hills, while an icy wind moaned through the glen. 'My father!' cried the boy joyfully.

A group of men were crouched on a hillock outside the house, and after glancing down the slope, they simultaneously levelled their guns and fired. With one exception, they then turned and ran. He who remained was a tall sinewy man,

with a slouched hat and a long gray overcoat, outside which a belt was fastened. His hair and whiskers were reddish, and he had a yellow, wrinkled, hawk-like face, that was singularly repulsive. He stayed to watch the effect of his shot, then springing to his feet, uttered a shrill whoop, brandished his gun, and was about to follow his comrades, when the whistle of bullets passed the cottage, and after bounding upward, the man fell on his back in the snow, and lay motionless, his arms outstretched.

My hostess, her face pressed against the window, looked on breathlessly; and when the man fell, she dropped on her knees, and with uplifted hands, cried, in an agitated voice: 'God pardon me, for a poor wicked creature, who forgot that her cause was in His hands when I sought the life of an innocent *gossoon*!' She staggered to the bed, and throwing herself across the boy's feet, sobbed hysterically. He, divided between sorrow for his father and anxiety for himself, after one sad wail of 'Daddy! daddy!' sat pale and trembling.

The wind brought to us the dull sound of horses' hoofs, and a troop of lancers came trotting up the glen by twos, the sunlight glancing from the points of their spears. Behind, at a slower pace, two or three companies of infantry climbed the rugged path. The whole force was drawn up on the level space before the door, and an officer, attended by a couple of soldiers, entered.

The poor woman was too agitated to answer his inquiries, and I undertook to satisfy him about the passage of the rebels and my own identity.

'Who is this young man, madam?' he asked, referring to the boy, who, on finding himself observed, shrank back in the bed.

'Me son, capten—me only boy, yer honour.—Don't be afraid, Patsy darlin'; the han'some gentleman won't do anythin' to ye.'

'Is the poor lad ill?' the officer asked sympathetically.

'No, sir; no, yer honour; but the boys—the Faynians, I mane, sir—frightened him, an' runnin' home, he turned his ankle benathe him. That's all, capten, sir.'

The soldiers departed, and I soon followed, leaving the boy bemoaning the loss of his only relative, whose body the troops carried with them, while the woman tried to console him.

I arrived in London without further incident.

Business took me again into that neighbourhood some years afterwards, and as the weather was fine, I made an excursion to the scene of the adventure I have related. The place was easily found, and I was agreeably surprised by the changes that had taken place. Patsy Ryan was still with the widow, whose desire for vengeance had collapsed on the death of the boy's father. He was married, and had three sturdy children, who called the old lady 'grannie.' The little cottage was replaced by a substantial house; the rugged waste that formerly ran downward from the door, was now cultivated and fenced in with the stones that Patsy dug from his land; a couple of cows grazed lower down; and pigs, ducks, and geese roamed about at will.

Nothing could exceed the tenderness shown by the old lady and her adopted son towards one

another; and as I sat before the hearth, surrounded by the family, I could not help contrasting the comfort and peace that now reigned there, with the poverty, the misery, the fierce passions that I saw on my former visit.

#### THE EGG QUESTION AGAIN.

At a recent meeting of the Balloon Society, a paper was read, by Mr Charles E. Hearson, on the Embryology of a Chicken, in which he gave a sketch of the progress of artificial incubation from the time of Réaumur to the present day. Major Leslie moved a resolution to the effect that, in the opinion of that meeting, the enormous increase in the importation of foreign eggs into this country should draw attention to the necessity of developing the home supply both by natural and artificial means. As one of the largest land-owners in the county of Monaghan, he was pleased to find this Society calling attention to an essential Irish home industry. Ireland was at that moment sending more eggs to this country than ever it did. Mr W. H. Le Fevre, C.E., stated that the following sums were paid for eggs imported into the United Kingdom in 1886: From Germany, £743,618; from Belgium, £653,784; from France, £1,215,360; from other countries, £266,280: total, £2,879,042. He believed that in Ireland alone a sufficient quantity of eggs could be produced to supply the whole of the United Kingdom. If a portion of the sum we now pay France, Germany, and other countries were remitted to Ireland in exchange for that commodity, it would go some way to improve its condition. Fortunately, science was coming to our assistance in effecting improvements in incubation for hatching chickens. As a native of the Channel Islands, he remembered the time when the South-Western Railway had considerable difficulty in filling three steamers per week with produce from the Channel Islands and the coast of Normandy. They now had twenty-five to thirty steamers bringing over provisions to this country every week. It was not an unusual occurrence to find a large steamer filled with nothing but eggs. He attributed the success of the South-Western Railway Company to the agents employed by them in collecting the traffic.

#### THE DEAD FRIEND.

My sun is darkened, and my broken life

Creeps sadly on, through never-ending ways  
Of deathless sorrow. In my friendless days

Hereafter, there must come again the strife

Wherein he cheered me, and the battle rife

With weary doubt; but he no more will raise

The drooping spirit with his kindly praise

That now is silenced. I have ta'en to wife

Grim Sorrow; she is mine for evermore.

Dear friend, upon some far-off silent shore

I fain would lie with thee, as sometime here,

In still communion; but between doth pour

The flood of death, and I may only peer

Out through dark dreams and know thy spirit near.

## THE PRIVILEGE OF SANCTUARY.

Six cities of refuge—three 'on this side Jordan,' and three 'in the land of Canaan'—were appointed by Moses, 'that the slayer might flee thither, which should kill his neighbour unawares, and hated him not in times past; and that fleeing unto one of these cities he might live.' Heathen temples and sacred enclosures were in later times the asylums for those who availed themselves of them. Before the privileges of sanctuary were recognised by legislators, they were accorded by the general usage of Christian churches. Constantine is alleged to have legislated upon this subject as early as 324. It is, however, absolutely certain that Theodosius in 392 made a law which explained and regulated the privileges of sanctuary, but that he did not establish them. Theodosius II. extended the privilege of sanctuary from the altar and body of the church, to which it was confined, to all the buildings and courts contained within the outward walls. Papal sanction to the privileges was not accorded until about 620.

The intention of the original law of sanctuary was to provide a refuge for the innocent, injured, and oppressed; and, in some instances, to grant a delay till an impartial hearing could be obtained, or an intercession made for the offender. By the Roman law, murderers, escaped slaves, robbers, public creditors, and others were excluded from sanctuary privileges; whilst almost all criminals were admitted to them by the canon law and the popes' decrees.

It has been affirmed, on somewhat doubtful authority, that the security of sanctuary was accorded in this country towards the end of the second century; but that the privilege of sanctuary was expressly recognised in a code of laws promulgated in 693 by Ina, king of the West Saxons, there is no doubt. The fifth law ordains that if a person convicted of a capital offence fled to a church, his life should be spared; and also that if any one who deserved to be flogged sought refuge in a church, the stripes should be withheld from him.

Nearly two centuries later—in 887—the privilege of sanctuary was, by the law of Alfred the Great, accorded for three nights to any person who sought the protection of the church, so as to enable him to provide for his own safety, unless he should previously compound for the offence. By this law it was ordered that if any one should violate the sanctuary by inflicting blows, wounds, or bonds, he was compelled to pay the sums which were awarded for the injury by law, and the large sum—in those days—of one hundred and twenty shillings to the ministers of the church.

With the Norman Conqueror, the law of sanctuary became more definite. The extent of the privilege, however, appears to have been more or less varied. The privilege at Beverley, which was granted by Athelstan, extended for a radius of a mile, taking St John's as the centre. The outward and second boundaries were designated by crosses of rich carving. The third boundary began at the church entrance. The sixth embraced the high altar and the 'fridstool.' This word, made up of the words 'frith' and 'stol,' means the seat of peace. This was invariably, we believe, a heavy stone chair. That at Beverley is utterly devoid of decoration. There is no trace thereon of any former inscription. It undoubtedly had a Latin inscription upon it formerly, which in effect stated: 'This stone chair is called Fridstool—that is, the Chair of Peace, to which what criminal soever flies hath full protection.' The Beverley fridstool has been broken, and repaired with clamps of iron.

We have said that the privilege of sanctuary varied in places, and have referred to Beverley. Sanctuary at Durham extended to the church there, its churchyard, and its circuit. All who came within a certain distance were afforded protection. The penalties for violation of privileges of sanctuary at Durham increased 'in proportion to the degree of holiness ascribed to the successive distances. The violation of the security of sanctuary between the outer and second boundary at Beverley was punished by a fine of one "hun-

dreth," or eight pounds. The second space was secured by a penalty of double that sum. In like manner, a fine of six, twelve, or eighteen "hundredth" was incurred by any one who violated the sanctity of the space between the successive boundaries up to the sixth. But if a person should take a malefactor from within the sixth enclosure, he would be what was styled "botelas" (bootless)—his offence would be such as no payment could redeem. Within the precincts of Holyrood Abbey (Edinburgh) the privilege of sanctuary was granted, as also in the ancient churches of Stow and Innerleithen.

The boundary-stones set up in the four roads leading to the monastery of Hagulstad (Hexham), in Northumberland, were rude crosses, around which, partly in Saxon characters, was the word 'Sanctuarium.' The fridstool at Hexham is the handsomer of the only two which are extant in our day—the fridstool at Beverley having been hewn out of a solid block of stone, and perfectly plain; whilst that at Hexham—which is carefully preserved—has interlaced ornamentation of Saxon or Norman origin cut on the top of it, and a moulding immediately below and around the seat.

In describing the method of claiming the privilege of sanctuary and the ceremonies observed, we cannot do better than quote from the Rev. James Raine's preface to the fifth volume of the Surtees Society, which relates to the sanctuaries of Durham and Beverley. Mr Raine writes: 'At Durham, persons who took refuge fled to the north door, and knocked for admission. The large knocker upon the north door is believed to have been that which was used for the purpose. There were two chambers over the north door in which men slept, for the purpose of admitting such fugitives at any hour of the night. As soon as any one was so admitted, the galilee bell was immediately tolled, to give notice that some one had taken sanctuary. The offender was required to declare, before the shrine of the patron saint and certain credible witnesses, the nature of his offence, and to toll a bell in token of his demanding the privilege of sanctuary. The notice of this custom occurs constantly in the registers of the sanctuary at Durham until the year 1503.'

A copy of the oath taken by those who sought 'its peace within a mile'—the only copy now extant—is to be found in the Beverley register, which is one of the Harleian Manuscripts. The bailiff of the Archbishop of York, who administered the oath, was instructed to ascertain of the refugee 'what man he killed, and wher with, and both ther names; and then gar hym lay his hand upon the book, sayng on this wyse: "Sir, tak hede on your oth. Ye shal be trew and feythful to my Lord Archbishop of York, lord of this towne; to the Provost of the same; to the Chanons of this church, and al other ministers therof. Also, ye shal bere gude hert to the Baillie and xii. Governors of this towne, to al burges and comyners of the same. Also, ye shal bere no poynted wapen, dagger, knyfe, ne none other wapen agens the kyng's pece. And ye shal be redy at all your power if ther be any debate or stryf, or oder sothan case of fyre within the towne, to help

to surcess it. Also, ye shal be redy at the obite of Kyng Adelstan, at the dirige, and the messe, at such tyme as it is done at the warnyng of the behman of the towne, and do your dewte in ryngyng, and for to offer at the messe on the morne. So help you God and thies holy Evangelistes." And then gar hym kyse the book.' The bailiff's fee was two shillings and fourpence, and that of the clerk, for entering in the sanctuary register, fourpence.

Sir William Rastall, Chief Justice of the Court of Common Pleas during the reign of Queen Mary, has handed down to us the form of confession and abjuration. It reads as follows: 'This hear thou, Sir Coroner, that I, M. of H., am a robber of sheep, or of any other beast, or a murderer of one or of mo, and a felon of our lord the king of England; and because I have done many such evils or robberies in his land, I do abjure the land of our lord Edward, king of England, and I shall haste me towards the port of such a place which thou hast given me; and that I shall not go out of the highway; and if I do, I will that I be taken as a robber and a felon of our lord the king; and that at such a place I will diligently seek for passage, and that I will not tarry there but one flood and ebb, if I can have passage; and unless I can have it in such a place, I will go every day into the sea up to my knees, assaying to pass over; and unless I can do this within forty days, I will put myself again into the church as a robber and a felon of our lord the king; so God me help and His holy judgment.'

'Every one'—to quote Mr Raine again—'who had the privilege of sanctuary was provided with a gown of black cloth, with a yellow cross, called St Cuthbert's Cross, upon the left shoulder. A grate was expressly provided near the south door of the galilee for such offenders to sleep upon; and they had a sufficient quantity of provisions and bedding at the expense of the house for thirty-seven days. In the sanctuary at Beverley offenders were treated apparently with still greater kindness. They were received there with humanity, and during thirty days had their food provided in the refectory, and if they were persons of any distinction, had a lodging in the dormitory or in a house within the precincts. At the end of the time, their privilege protected them to the borders of the county; and they could claim the same security a second time under the like circumstances. But if one's life was saved a third time by the privilege of sanctuary, he became permanently a servant of the church.'

This protection by the church was, it has been seen, only of a temporary character. The murderer or felon was required, within forty days after he had taken refuge, to appear before the coroner, clad in sackcloth, and before him confess his crime and abjure the realm. No person was allowed to feed him beyond the forty days. By an Act of Parliament passed in the twenty-first year of the reign of Henry VIII., the culprit 'immediately after his confession, and before his abjuration, was to be branded by the coroner with a hot iron upon the brawn of the thumb of his right hand with the sign of the letter A, to the intent he might be the better known among the king's subjects to have abjured.'

The privilege of sanctuary was so frequently

abused, that the privileges were from time to time restricted. Thus, in 1378, it was ordained that debtors fleeing to Westminster with the intent of defrauding their creditors, should have their goods and lands levied upon for the purpose of discharging their debts. Pope Innocent VIII. in 1487 authorised the arrest of persons who had gone forth from sanctuary for the purpose of committing murder or robbery, although they had sought refuge a second time; and at the same time ordered that those guilty of high-treason, who had taken sanctuary, should be prevented from escaping. This bull was confirmed by Alexander VI. and Julius II. in 1493 and 1504.

Either Henry IV. or Henry V. addressed a letter to Cardinal Langley, which is preserved in the Treasury, in which the Crown respected the immunity of St Cuthbert even in a case of treason. It reads as follows: 'By the king, H. R. Trusty and welbeloved in God, we grete you well. And wheras we undirstand that Robert Marshall, late comitted to prison for treason, is now escapid and broken from the same into youre church of Duresme; we havynge tender zeles and devocion to the honor of God and Saint Cuthbert, and for the tendir favor and affection that the right reverend fader in God our right trusty and welbeloved the Bisshop of Duresme our Chauncellor of England we have for his merits, wol that for that ocaacion nothyng be attempted that shud be contrarie to the liberties and immunitie of our church. We therfor wol and charge you that he be surely kept there, as ye wol answer unto us for him.—Yeven under oure signet at our towne of Stanford, the xxvii. day of July.—To oure trusty and welbeloved in God the Priour of Duresme.'

Between the twenty-second and the thirty-third years of the reign of 'bluff King Hal,' the privileges of sanctuary were considerably altered. It was discovered that the strength of the realm was much weakened by men seeking sanctuary and abjuring the realm, who disclosed state secrets, and instructed foreigners in the use of the bow and arrow; so it was enacted 'that every person abjuring was to repair to some sanctuary within the reign, which himself should choose, and there remain during his natural life; and to be sworn before the coroner upon his abjuration so to do. But if he went out of that sanctuary, unless discharged by the king's pardon, and committed murder or felony, he was liable to be brought to trial for his offence, and was excluded from the right of felony.' About four years later (26 Henry VIII.), privilege of sanctuary was withheld from all persons accused of high-treason. In the following year, 'all sanctuary persons were to wear a badge or cognisance, to be assigned and appointed by the governor of every sanctuary, openly upon their upper garment, of the compass, in length and breadth, of ten inches,' under pain of forfeiting all the privileges of sanctuary. They were also prevented from carrying any sword or other weapon except their meat-knives, and those only at their meals. They were not to leave their lodging except between sunrise and sunset, under penalty of forfeiting their sanctuary for the third such offence. Six years later, Henry, in the thirty-second year of his reign, further restrained the privileges of sanctuary. The privilege was

now limited to parish churches and churchyards, cathedrals, hospitals, and collegiate churches, and all dedicated chapels used as parish churches. The exceptions were made in favour of Wells, Westminster, Manchester, Northampton, York, Derby, and Launceston. The privileges were, in the succeeding year, transferred from Manchester to Westchester in Cheshire. One of the first acts of James I. was to further abridge sanctuary protection; and the same monarch, twenty years later, (in 1624) finally withdrew the privileges of sanctuary.

The offences of those persons who sought refuge at Durham and at Beverley were—murder and homicide, debt, horse and cattle stealing, escaping from prison, housebreaking, rape, theft, backward in his accounts, harbouring a thief, failing to prosecute, treason, receiving stolen goods, and coining.

With Hallam, we agree that under a due administration of justice, the privilege of sanctuary 'would have been simply and constantly mischievous; as we properly consider it to be in those countries where it still subsists. But in the rapine and tumult of the middle ages, the right of sanctuary might as often be a shield to innocence as an impunity to crime. We can hardly regret, on reflecting on the desolating violence which prevailed, that there should have been some green spots in the wilderness where the feeble and the persecuted could find refuge. How must this right have enhanced the veneration for religious institutions! How gladly must the victims of internal warfare have turned their eyes from the baronial castle, the dread and scourge of the neighbourhood, to those venerable walls, within which not even the clamour of arms could be heard, to disturb the chant of holy men and the sacred service of the altar.'

## RICHARD CABLE, THE LIGHTSHIPMAN.

### CHAPTER XXXIV.—THE 'MAGPIE.'

THERE stood a humble inn—a tavern, rather—called the *Magpie*, on the downs; its door opened on no high-road; but it stood where lanes or side parish roads converged. In the olden days, it had been a resort of smugglers, who had run their goods into Pentargon cove. The taverner had then always maintained half-a-dozen donkeys, and these were employed in transporting the smuggled goods up the cliffs by the precarious path which alone gave access to the cove, and enabled goods brought there to be carried away. The smugglers knew well enough how to surmount the most difficult portion of the ascent: they stretched a rope along it from a crowbar driven into the turf above. As for the donkeys, they were unshod and sure-footed, they would run almost where a squirrel went.

But the smuggling times were past, so were the days when a lively trade in wrecks was carried on; and the *Magpie* would have perished of inanition, had not the landlord begun to enclose the downs and annex a farm to his alehouse. The place was so exposed, so wind-swept, that only rye would grow there; but he kept plenty of sheep and several pigs, and reared, though he could not fatten cattle.

As none of the roads that met at the *Maggie* were market-roads, the host could only count on stray passengers, fagged with laborious scrambles up the stony and steep coast-road, to drop in for refreshment. His most regular customers were the coastguard, who, in their nocturnal tramps along the cliffs, passed his door twice every night, and never passed without a halt and a drop of comfort.

Partly because the coastguard wished to do Jacob Corye a good turn, and partly because the *Maggie* was the nearest inn, they conveyed the Cable family beneath its sheltering roof. Richard was put to bed, a surgeon sent for; and Mrs Cable undressed the children, borrowed dry clothes of the landlady for them, and set to work to wash the salt out of their garments and hang them up to dry.

Scarcely had the Cables been housed, before a swarm of men came down the cliff to the beach, from which the tide was retreating, invaded the *Bessie*, and began to ransack and strip her, as the ants will attack and strip a dead bird cast near their mound. Sails, shrouds, anchor, binnacle, the fittings of the cabin, the contents of the galley, the mattresses of the berths, the benches, stools, the chests, everything they could remove was carried away. They heeded neither cold nor wet; they disregarded the peril to their lives from the waves that still swept the wreck, so eager, so ravenous were they for spoil.

The days of the wreckers are long over—that is to say the days when wrecking was called wrecking; it is now called salvaging, from the Latin word *salvare*, to save; but this does not imply that those who have been wrecked get much more than if they had fallen into the hands of wreckers. Those whose fathers went wrecking, now go salvaging; and very consoling it is to us to know that we have made such an advance in civilisation. As a matter of fact, the thing is pretty much the same. All salvage is supposed to be given up to an official Receiver of Wreck—on the coast where the *Bessie* was cast, this was the head coastguard. But it is by no means certain that all that is salvaged is thus delivered over. When the receiver has got what the salvors have chosen to deliver up, then the Board of Trade investigates, and decides between the respective claims of the owner and the salvor, retaining, however, a share for the Crown. Mostly the wreckage is sold by auction first; and it is the proceeds which are divided, the Crown taking a third, and the salvors a third; and a third is left to the owner. To the last-named, the salvaging looks very like wrecking; to Richard Cable, very much so on this occasion; for the things were sold when he was unable to attend, and the amount raised to be divided by three was not much, and his receipt infinitesimal compared with the value he set on his property. Moreover, things he valued highly sold for pence and farthings. Richard was irritated, and not at all in a frame of mind to be comforted by the thought that everything he treasured had gone under the category of salvage, and was therefore clean away from him for ever.

'It is her doing—it all comes of her!' he muttered, and tossed in fever and rage on his bed. He was unreasonable in his anger. The

thought of Josephine as one who brought evil on him and pursued him remorselessly, had taken hold of his fancy, and he attributed every misfortune to her; not altogether without a cause, for had she not made Hanford unendurable to him, he would not have left it; had he not left it, he would not have been wrecked; had he not been wrecked, he would not have been crippled; and had he not been crippled, he would have returned to his ship the moment he saw his children safe, and then no wreckers or salvors could have meddled with its contents.

His very ship was no longer his own; it had passed into the hands of the salvors. Fortunately, all his money was safe; before leaving, he had secured it about him. But the amount was small, after he had paid his rent and all the little bills at Hanford.

Presently, Mrs Cable came up and took his hand. It was hot, and his cheeks were flushed. 'The surgeon is a long time coming,' she said. 'O Richard, this accident to you is worst of all.'

'That is as it should be,' he answered. 'I threw little *Bessie* down and injured her; now she has cast me down and lamed me. If in like manner as She at Hanford Hall'—he would not name Josephine—'has brought misery and ruin on me and mine, misery and ruin might befall her, I were well content.'

'Richard,' said Mrs Cable sorrowfully, 'I do not recognise you, with these bitter feelings in your heart.'

'I do not recognise myself. Do you know how if a little gall falls into a pot, it spoils the whole mess? She has spilt wormwood into my life; and the world, everything I taste and smell and see and hear and feel, is bitterness to me.'

The doctor arrived; and with the help of the innkeeper, Richard's leg was got in place again; but the surgeon shook his head, and said that there was more injury than mere displacement done—that the recovery would be slow; the leg must be given perfect rest; and that, unfortunately, it was likely Richard would always have a stiff joint.

'That also,' muttered Cable, clenching his hands in the bed—'that I shall owe to her, and bear ever about, as a lasting record against her, a warning against my ever forgiving her.'

He was restless whilst confined to his bed, and his restlessness interfered with his convalescence. He was impatient to get away, to be at his future home. The pain he suffered made him irritable; but disappointment chafed him more than physical pain. What wrong had he done that he should be thus pursued with misfortune? He had done his utmost for his children; he had discharged his duties as a lightshipman, as a son, as a husband, conscientiously; and yet—Providence laid on his back lash after lash, as if he were one who needed chastisement to be brought out of evil courses into the right way. He murmured at the ways of Providence; he accused it of injustice, of cruelty, of blindness. He was wroth with the crew for deserting the *Bessie*. If they were all drowned, it served them right. Had they remained, one could have continued in command of the vessel, and

delivered it from becoming a prey to the salvors. He was angry with those who had despoiled his ship, though he knew that they had acted with legal right. He was incensed with his hostess, who had come up to his sickroom and demanded whether he were prepared to pay for all the food and care and housing he and his family received.

'We're poor folk,' said the woman, 'and can't afford to keep eight people for nothing. The children eat a lot o' bread and butter, and drink a gallon of milk. My man is a hard-working chap; but he don't calculate to maintain a family as ain't his own.'

Richard had promised to pay; but the demand of the woman, though reasonable, appeared selfish and hard to him.

'You know,' said she, 'I've heard that folks be going about with a brief to get together a few shillings, maybe a couple o' sovereigns or even more, for you; and when you've got the money, you can pay me out of that.'

Then Richard was very hot with indignation. 'Tell those busybodies who have begun the collection, to return every penny. Not one coin of it will we touch. I am not a beggar. I will take nothing from any one but what I have earned with my hands.'

He knew that his scanty fund would soon be exhausted; but he would not stoop to receive a gift. He was a proud man—he had inherited pride from his mother.

Then he thought of Josephine, always with a simmering rage in his heart. He counted over all the insults she had heaped on him. He recalled her look, the flash of her eye, the distended nostril, the curled lip, the contemptuous shrug of the beautiful shoulders, the intonation of her flexible voice. He could not yet shake off the fascination, the admiration she produced in him; but he thought of her without love. What was she now doing? How had she borne the news of his departure? He knew but too surely. She had laughed, and clapped her hands, and tossed her beautiful head, and said: 'I am well rid of him.' Now she was free, and enjoying herself, going about to all the tennis-parties and picnics and dinners in the neighbourhood, courted, making herself agreeable, saying sharp and witty things, singing and playing, forgetting him utterly, and only now and then, when forced to recall him, recollecting him with a sneer. As he thus thought, he ground his teeth and tore at the sheet till he had ripped it into rags; and he bit at the rags and tore them smaller and threw them about him, in impotent fury. Verily, he hated Josephine with deadly hate.

Jacob Corye, his host, was a good-natured man, and he came up with his pipe occasionally, and with a jug of ale in one hand, and sat and talked with him; but his talk did not much interest Cable—it was all about bullocks.

'You see, cap'n, this is how we're beat. We can raise just about any amount of young stock here; but we can't fat 'em. There's no rich pasture to make 'em fat; or it may be the salt that is over all the land, carried by the wind and air for a score o' miles inland, takes the goodness and the fattening properties out o' the grass. I can't say; I'm no scholar. But we can raise 'em; we can raise 'em in any numbers. We can raise

and rear 'em; but we can't sell 'em to good advantage, all because we can't fat 'em. If, now, we could fat 'em as well as raise and rear 'em, then it's pounds on pounds we could make; but we can't do it. I've turned it over and over in my mind, and I don't see how it can be altered. You may take my word for it, cap'n, rearing is one thing, raising is another, and fattening is a third. It is just as with milk—there's milking, and creaming, and buttering. Now, we can rear and raise, but we can't fatten; which is all the same as if in a dairy they milked and made cream, but somehow could turn the cream into butter. Consider the loss that would be, if they couldn't make butter out of the cream! Or, put it another way, with wool—there's the shearing, and then the weaving, and then the tailoring, before the coat of a sheep comes on my back. There's a profit goes in the shearing, another in the weaving, and again in the tailoring. Just reckon it up in your mind what a fortunate thing it would be for me if I could shear the wool off my sheep and clap it straight on to your carcass without any intervention of weaver and tailor. It would not be keeping of the *Maggie* I'd be then, and getting a few coppers out of the coastguard of a night, when they're prowling about looking for each other. It do rile me uncommon, thinking how I'm beat about the fattening.'

'I'm not surprised at your house bearing the sign of the *Maggie*,' said Richard impatiently.

'Ain't you?' answered Jacob. 'Well, now, that's a curious coincidence; nor am I. I found it called the *Maggie* when I was born into it. But—as I was saying about the young cattle.'

'Oh—the cattle.' Richard turned his head irritably from side to side on the pillow. 'I thought you'd fattened 'em off and done with them.'

'On the contrary,' said Jacob eagerly, 'that's just what I can't do. There come the rascally regraders about, and pick up our calves or young stock; and they take 'em to Camelford or Launceston or Bideford, poor and thin, naught but skin and bone, because we can't fatten. If we could fatten as we can rear and raise, we'd get better prices; but we can't. It's like your seven little maids—just as if you could rear 'em and educate 'em, and couldn't marry 'em, because you'd no money to lay on 'em thick as slabs o' yellow fat. There'd be a cruel case, to have the bringing up of all them maidens and not to be able to marry 'em. I say it's all the same with our young stock. The regraders make a profit at the market; and then others take the cattle, and when they've fattened 'em, they sell 'em to the butchers; and they kill 'em, and there's a profit again. There's two profits goes out of my pocket, and I'm beat if I know how to compass it to secure 'em to myself.'

'I want to go to sleep,' growled Richard, driven desperate by the incessant chatter of the host about raising and rearing and fattening.

'Put it to yourself,' continued the landlord placidly. 'It would be a vexing thing for a father like you to have raised seven little maids—and I will say they're as promising young stock of the human kind as I've seen many a day—and been to pains and expense rearing and educating of

'em; but you never get no farther—never can fatten 'em. You toil and you contrive and pinch yourself every way for 'em; but they remain like Pharaoh's lean kine. You can't do nothing with 'em; no buyer will take 'em off your hands; all your labour and care is so much waste, because you can't fatten. That would be an aggravating sight for a father in his old age to have all these seven as bony, lean old maids browsing about him, because he was unable to dispose of 'em in the marriage market! You can understand that; then you can understand the feelings of a farmer here with his calves. There is nothing like bringing a situation home to a man personally by personal application,' said Jacob sentimentally.—'My pipe is out.'

'I'm not surprised,' sneered Richard.—'Hark! what is that? Who is down-stairs? I hear a voice I know!'

An exclamation in the doorway from Mrs Cable: 'Oh, Mr Sellwood! You here!'

'Come all the way from Hanford on purpose,' was the answer. 'We heard there of the wreck. It was in the papers; and I came to gather information about those who were lost—poor fellows, for their relations. I thought it would ease their minds. But most of all, I've come to see Richard—I have a message for him.'

'From whom, rector?'

'From his wife—from poor Josephine.'

Poor Richard? Richard laughed scornfully in his bed.

A brief paragraph in the papers was all that informed Hanford people of the loss of the *Bessie*. When a ship is wrecked and sailors' or passengers' lives are lost, depositions are taken as to the facts, and the names are entered in an official record; but very little information gets about. When a man-of-war or a passenger vessel sinks, then full lists of those who go down in her are published. When a railway accident occurs, then we know who were killed, who had bones broken, who were bruised, and who had only their hats battered and their shirts crumpled. But when a sailing-vessel, a trader, a collier, a fishing-smack is lost, the matter is dismissed in a line of the daily paper; there is no sensational writing done about it; no details of the tragedy are given. The loss is too insignificant, too much in the common run of events, to demand much attention. When, in the post-office, a letter goes astray, especially if that letter contains half-a-dozen postage stamps, a great stir is made; the general Post-office sends down an official to investigate the matter, to track the course of these six Queen's-heads, and to bring to justice the postman through whose dishonesty they have been made away with. But when a ship, not an envelope, and six living human heads are lost—not six little paper portraits worth a penny each—not a perfunctory inquiry suffices; no one concerns himself to see whether blame attaches to any one; scarcely is the trouble taken to count the lost heads and ascertain whether it were half a dozen, or twelve, or a baker's dozen. So, when the scanty tidings of the loss of the *Bessie* reached Hanford, no one knew the particulars.

In such cases, on the seacoast, the parson is the one who collects the requisite information. He writes to the parson of the parish where the

wreck took place, and the latter is almost sure to supply the desired particulars. But if the parson be like Baal, either talking or hunting or on a journey, or peradventure sleeping, then there is neither voice nor any that answereth, and the trembling, anxious wives and mothers must remain in suspense.

The importance of the tidings of the loss of the *Bessie* did not strike either Josephine or her father at first, for neither was aware of the change of name; but the rector soon knew, and came to the Hall to break the news to Josephine. He at once volunteered to run down by express to Bideford and take the North Cornwall coach on, and learn all that was needed to be known, and telegraph what he heard to Hanford. Josephine wanted to accompany him, but he dissuaded her from so doing.

Mr Cornellis brightened at the news. 'Really, Josephine,' he said, 'luck is on your side.'

She did not answer him, but went into the garden after the rector, caught his arm, and said: 'Tell him—tell him, if he be alive, that I send him my humble love. He has only to hold up his finger, and I will come to him. Tell him all—he must now know all.'

'Say nothing to your father about your resolution till my return.'

Thus it came about that the good, kind old man arrived at the *Magpie*.

On his way from Bideford, he had occupied the box seat, and the coachman had been able to tell him about the wreck. The crew were all lost—how many they were, he did not know; but the captain and a woman, his mother, and six or seven little children, were saved, and were all at the *Magpie*. 'And, looky' here, sir,' said the driver; 'whatever you do, don't drink none of Jacob Cory's beer; it's bad. I reckon it be brewed with Epsom salts. I took a couple o' glasses once, and I couldn't drive the coach next day, I were that pulled down. None of the quality, sir, patronises the *Magpie*, only them coastguard—a low lot, sir; and Jacob's beer and Epsom salts agrees wi' them, happen.' He drew his lash across the leader.—'You don't happen to know Jacob, sir?'

'I have not had the honour.'

'You'll please to mind what I have said about his beer, sir. Jacob is always going on upon his young stock because he can't fatten. He begrudges the money picked up by they who take them off him and put them in rich pastures for a few weeks and then sell them at a great profit. It is all very well for Jacob to grumble that way; but it is my belief that he drenches his bullocks with his beer. I'd be glad to know what becomes of his beer, if he don't give it to the cattle. No Christian—only coastguards—will drink it; and you can't fatten young stock on Epsom salts. I put it to you, sir, as a man of the world and a Church of England minister—can you?' Again he wiped the back of his head, as tenderly as a fly-fisher wiping the glassy surface of a pool for a trout. 'Looky' here, sir! Them coastguard men took the cap'n of the wreck to the *Magpie* because they drinks there, what no one else in his senses would do, not if he has any respect for his vitals. It do seem a cruel pity that the party there should run the risk of being poisoned, just to oblige the coastguard and Jacob

Corye.—You're going to see the cap'n you say, sir. Well, I think—you'll excuse the freedom I take—that you'd be acting as a true minister of religion if you'd caution the cap'n against the *Maggie* beer. It's that lowering, sir, that you, sir, whom I take to be an archdeacon?—

'O dear, no!—nothing of the sort—a simple rector.'

'Even if you was an archdeacon, sir, after a week of that *Maggie* beer you would be a tee-totalling all over the county.'

When Mr Sellwood descended from the coach, he tipped the driver so generously, that the coachman drew close to him with a radiant smile and said, behind his hand: 'You'll not touch a drop o' that beer, sir; and say a word in season to the cap'n.' As he strolled away towards the tap of the inn where the coach stopped for the night, he said to himself: 'If he was to take half-a-dozen glasses of that beer, it would so lower him altogether, that, for the return journey, he'd give me a sixpence instead o' half-a-crown. A man can't come to greater degradation than that, I reckon.'

Forewarned in this way, the rector of Hanford, after having deposited his portmanteau at the inn where the coach stopped, walked off to the *Maggie*.

#### A PENNY BOTTLE OF INK.

It is a wet and windy day, cold and cheerless, during the season that is known in England as summer. We are located at the seaside, and the necessity has arisen for writing an important business letter. We have called for paper, pen, and ink; and although the first is obtainable—some having been included, by a rare chance, among the chaotic mass of indispensables brought from the homestead—the ink and the pen are not forthcoming. Even the landlady of the lodgings has admitted her poverty in this particular, and as a last resource, the domestic has been despatched through the rain to the nearest stationer's; and she has returned with a small bottle of ink and a pen and holder, for which she has laid out one penny.

The letter is written, and lies ready to be despatched. As the rain continues to fall, we are driven for lack of occupation to consider and to criticise the furniture, and the various shelly and sea-weedy ornaments that adorn our sitting-room. But there is a limit to even satirical comments on shabby furniture, and as all else in the room has been (metaphorically) dragged to pieces, the recent purchase comes under notice. A penny bottle of ink! There can be nothing remarkable in so commonplace an article. Have we not seen them in the news-vending class of stationers' shops, heaped together in the corner of the window, or on a back shelf—rough, dingy, uninviting objects! Why waste a moment of time or a passing thought over such merchandise? But the rain keeps us within doors, and affords an excuse, in the absence of other amusement, for turning to this humble pennyworth.

Whatever else it may be, it cannot with justice be classed as a dear purchase. The shopkeeper, presumably, made a profit on the sale, the manufacturer also benefited, and most likely there was a middleman, who has not gone unrewarded. It

would appear that our purchase of this small bottle has assured a monetary profit to two, if not three, tradesmen. When we come to think of it, there must be many others who have shared in our penny. When examined in order, we find: the bottle; the ink, black and fluid, and exceedingly pleasant for writing; a cork, sealed with wax; a printed label, covering a slot in the bottle, in which rests a wooden penholder, containing a good steel nib. Thus we have six articles, each one from a different source, brought together and retailed for one penny. How can it be done for the money? Perhaps, if we examine still closer, we may get some insight into the secret, though to fathom it completely must necessarily be beyond us.

The glass of the bottle is of the cheapest quality. It is evidently made of 'cullet'—a technical term for broken windows, tumblers, bottles, and every description of fractured glass. Among the curious trades that abound are collectors of broken glass, who clear the dust-yards and the builders' yards, and carefully select and keep apart the flint and plate glass from the common window-panes. These collectors supply the small glass-blowers; and vans loaded with this fragile freight may oftentimes be seen journeying to the workshops, where, night and day, the furnaces blaze, and perspiring men blow the molten metal into the heated moulds that shape the bottles. The moulds themselves have taxed a more than ordinary intelligence. It needs a rare mechanical mind to produce even a common bottle mould. The pattern-maker, the iron-founder, and the mechanic who finishes the rough castings, have all brought their special tact and knowledge to bear, before a single bottle could be produced. The mould reaches the glass-house, where alternate shifts of men are constantly blowing and annealing the bottles, supervised by foreman or master, who, with the previously mentioned makers of the mould, have all shared with the manufacturer and retailer in the profit of our penny.

Next, we take the ink. Who shall tell how many persons are directly and indirectly concerned in this small quantity of liquid? Leaving on one side the 'unspeakable Turks' who have stripped their oak-trees of the gall-nuts, of which all black inks worthy the name are made; and on the other hand, the hardy north-countrymen, dwellers on the Tyne, where the best copperas is produced; there are the brokers, dealers, and drysalters, with their clerks, porters, and the dock labourers; there are the chemist who blends the chemicals and the ink-boilers who have made the ink; there are the men, boys, or girls who pour it into these small bottles, and in other ways prepare it for sale—every one of whom has had a portion of our penny.

The cork is so small as almost to escape notice. Workmen in Spain or France have stripped the bark from the cork-tree, after ten years' growth; other brokers and their satellites have sold it at public auction or by private contract; the skillful cutter has shaped it with his sharp knife (from Sheffield)—and all these have found their reward in a portion of our penny.

If the cork was small, what shall be said of the seal upon it? In this minute dab of wax we have rosin from America, shellac from India,

a pigment for colour, and other ingredients known only in the mystery of wax-making. These—not forgetting the manipulator's wages—have all been paid out of our penny.

The label suggests the paper-makers, and we might go further back to the typefounder and compositor, the printer and the cutter-out, and gluer, each one participating in our penny.

Now for the pen and the holder. There is a handle of hard wood, a tip to hold a pen, and a steel nib. It would be hard to say where the wood came from—probably from Norway—or to conjecture through how many hands it passed before reaching the shaping-machine, a beautifully constructed piece of mechanism, that splits and fashions it into its present polished cylindrical shape. The tip, or holder, has engaged the skill and intelligence of a tool-maker, who has designed cutters to pierce the soft sheet-steel, and other tools to bring it to its proper form—possibly through some half-a-dozen processes in heavy and costly presses. The steel itself has passed through many hands before reaching these artificers, and on leaving, passes through others to be hardened. The nib also owes its existence to the united labours of a similar army of workers—and all these, every one, has had a portion of our penny.

Though the portion claimed by each of the workers concerned in this bottle of ink must be exceedingly minute, the fact remains—the penny has paid them all. 'It is the quantity that pays,' yet that which rules a thousand gross, regulates in its degree the single bottle drawn from the bulk. How many profits can our penny have paid? From first to last, here, there, everywhere, all over the world, are the workers, direct and indirect, without whom our penny bottle of ink could not be. Who shall number them?

The rain is over, the sky is clearing; let us to the sands! Stay! Take care of our purchase. Give it a place of honour on the mantel-shelf. It deserves some consideration. Has it not beguiled a half-hour that might have been tedious? And it may be we, in our turn, have found one more profit in our penny.

## A MATTER OF CONSCIENCE.

IN THREE CHAPTERS.—CHAP. II.

DR WYNARD's first steps were directed in search of Heaton the butcher. That worthy, a tall, loutish north-countryman, was standing at his shop-door when the doctor arrived. The latter asked for Miss Brock's account, and paid it, obtaining a receipt in due form. When the last stroke of the straggling *n* was written, the doctor took the paper and put it in his pocket and then proceeded to business.

'Well, Mr Heaton, don't you think you are a fine specimen of a Christian, going to a dead man's house and worrying his daughter for your paltry money while her father's body is lying unburied up-stairs?'

'I'm a man that pays his own debts, and looks to other people to do the same,' said the butcher sullenly.

'Quite so,' said the doctor quietly but firmly. 'That is quite right; but there are proper and improper times for dunning your customers, and in this case you have chosen about the very worst

time possible. I do not suppose anything I could say to you would change your opinion; but Miss Brock can change her account to another shop. You need not send your cart any more up to Cullercoats.—Good-morning.'

As the doctor walked out of the village, meditating deeply on the sudden episode which had been introduced into his life by this dead man's will, he was startled by hearing some one close behind call him by name. He turned, with a start, and saw Mr Walker, somewhat heated by rapid walking, encumbered as he was with his black bag. 'I thought I should never catch you up, doctor,' he remarked. 'What a pace you do walk at, to be sure! I had some business to do at Cullercoats; and just as I was starting for home, I saw you coming out of Heaton's shop, and thought I might as well bear you company.'

'Oh, I am glad to see you,' said Wynyard. 'There are a lot of things about which I want to ask your opinion.'

'Six-and-eightpence, then, if you please!' said the lawyer. 'You are a moneyed man now, and a full-blown trustee, and also a guardian with a young lady for ward.'

'It is about her that I want to speak first,' said the doctor gravely, paying no heed to the small professional jest of his friend. 'She has no relatives, and no home to which she can go. I was thinking of asking my mother to take her in for the present. What do you say to the plan?'

'An excellent one for the girl, no doubt,' said the lawyer. 'It has only one fault that I can see. Have you considered that Captain Brock has, most unadvisedly, in my opinion, left you entirely free in the matter of spending money on his daughter during her minority? If your mother should take her in, every one will naturally come to the conclusion that you are paying yourself well, and making the most of the girl's fortune for your own benefit during the time it is in your hands. Now, if the old man had stipulated the sum to be paid for her board and education, there would have been no trouble at all. That comes of people making their own wills without our help.'

'I had not thought of that,' said Wynyard, and walked on silently for a few minutes with a somewhat clouded brow. 'After all,' he said presently, 'if it be clearly best for the girl, why should I mind what people say?'

'And your practice?' said the lawyer inexorably. 'People do not care to call in a doctor on whose reputation even the slightest breath of suspicion has rested. You had better think twice before you act.'

'What savages people are!' said Wynyard.

'Granted,' said the lawyer. 'But, for all that, I am not sure that, did I not know you personally, I should not have thought the view I have just given you the most probable under the circumstances.'

Wynyard walked on, meditating on the difficulties of the situation. 'I don't care,' he said at last. 'I have been intrusted with the guardianship of the girl, and been paid a thousand pounds for my trouble in the matter, such as it is. If people must talk, I cannot help it. I will do my duty as I see it, and make her as happy

as I can. I think, if I know my mother, she will not accept one farthing for taking care of Miss Brock.'

'All right,' said the lawyer. 'I admire your spirit, and hope you will succeed in persuading the world in general of your disinterestedness.—Here we are at my door; so good-bye till to-morrow morning, when I expect to see you, document and all. I own to a little curiosity as regards that same document. Captain Brock was a shrewd-headed man, and I would like to know how he has directed his money to be invested.'

'I am going home now to read it,' answered Wynyard; 'so you may expect to see me in the morning—unless, indeed, I am vowed to secrecy on the subject.'

'I hope not,' said the lawyer gravely. 'That would place you in a very awkward position.'

They shook hands and parted—the doctor going home to find his dinner cooked to rags, and his landlady impatient at his long absence. She was a good old soul, though rather short of temper; and Wynyard easily pacified her, and sat down to eat a hearty meal, and read his formidable document at the same time. Being a bachelor, he had fallen into the habit of always reading at his dinner-table.

The thick parchment envelope contained quite a variety of documents. The first that appeared was a roughly drawn plan, apparently of a mine of some sort. Then came a prospectus of the 'St Vrain's Mining Company (Limited),' on the back of which was pasted a list of prices of shares in the said Company, evidently cut from newspapers. Last of all was a document in the handwriting of Captain Brock, and to this Wynyard turned at once for information. It was long and closely written, and began by an account of the circumstances which led to the writer's presence in Colorado in the autumn of the year previous to that which was now closing. Then came an account of a long riding expedition, taken alone, in search of silver-bearing strata. Captain Brock did not mention with what end in view he had started as a prospector, but doubtless he had some idea of forming a Mining Company, and supplementing thereby his small income. Evidently, he had no mean knowledge of geology; even the uninitiated Wynyard could see that, from the remarks made here and there upon the places visited. The paper now took the form of a diary, and at last came an entry marked off from the rest by crosses in red ink. It ran as follows: 'October 14—lat. 39° 20' N., long. 106° 30' W. Found at last. Rich deposit silver—some gold. Lies pretty deep; only found it by accident. Started for San Francisco with specimens of ore.'

Evidently, the lucky prospector had been too absorbed in the thoughts of his find to care to keep up his diary, and a long blank of dates now occurred.

The next entry was dated January, and written in blotted characters, which it was not easy to read: 'Some speculator before me after all! St Vrain's Mining Company started to work same place as my find. Just my luck!'

Here the diary ended; and after the last words, was written, in the shaky handwriting of a sick man: 'Dr John Wynyard, I have appointed

you my trustee, as I believe you are a good man, and I have no relations or friends to whom to turn. I do not expect to recover from this illness—one of my shipmates died of the same on board of the *Miranda*, and I know the signs. This old diary of mine will save me a lot of writing. I need only take it up where I left off. I thought my find was to turn out worthless to me, and took no more trouble about it; but two days ago I received the enclosed plan of the St Vrain's mine, and I saw my way to a fortune at once. *They are working towards my "find," and will come upon it in a few months.* I got a file of old newspapers and cut out their share quotations for the past six months, and you will see they are going steadily down, which shows they are as yet working a poor vein. The shares are five-pound ones, and they are at one-and-one-eighth now! If only I were spared for a week, I would make a great fortune; but the news has come too late for me. It will be in time for my daughter, though, and she will be a great heiress. Sell out all my stocks and bonds, and invest the whole of the money—and the thousand pounds I am leaving you, if you wish—in the shares of the Company. As soon as the miners come upon my find, shares will go up with a bound. Don't sell the shares till they are at twenty pounds at the least; and if you must consult a lawyer, swear him to secrecy before you do so. And I adjure you as a dying man, keep the secret from all others except my daughter. Tell *her*, if you like. I have made my will in accordance with this paper, and given you full security for all you may do; and now I sign this paper in the presence of witnesses, to make everything square and honest. I wish I could have seen the affair out myself; but it can't be helped; and Mary will be an heiress if you be faithful to my trust; and I think you will.'

The paper was duly signed, and witnessed by two of the captain's servants.

Wynyard sat and looked at it blankly till the short daylight ended and the cramped letters became blurred and illegible. Then he gave a long sigh, replaced the papers in their envelope, and carefully locked them up in his desk, after which he lit his pipe and sat down in an easy-chair by the fire to meditate on the events of the day. The landlady's cat jumped into his lap and lay there, purring and contented, quite unconscious of the worries and difficulties that prevent the nobler animal, man, from ever being thoroughly happy in this world, however much outward circumstances may conduce thereto. And there we may leave our hero for the present.

Next morning, there was a ring at Mr Walker's door, and his thin, sallow clerk ushered in Wynyard, documents in hand, and with a decidedly grave expression of countenance, which the lawyer at once perceived.

'No bad news, doctor, I hope?' he said kindly.

'I don't know,' said Wynyard. 'A good deal of difficulty and perplexity, at all events.'

'Ah! How is that? You had best make a clean breast of it, and tell me all that the captain's document contains. Or let me read it myself, which perhaps will be better.'

'I must swear you to secrecy first, then,' said Wynyard; 'Captain Brock insists on that as an indispensable preliminary.'

'You have a right to insist upon that, in bringing me a document for my professional opinion,' said Mr Walker. 'And my profession can keep a secret as well as yours, doctor! But of course any promise of secrecy that I may give can only be contingent on my not being legally bound to disclose the contents of the papers you show me. If you can assure me of that, I will give you my promise readily.'

'I see I must trust you, then,' said Wynyard, 'for really my ignorance of business is such that I cannot give you any assurance at all about it.' And he handed the papers to Mr Walker.

The lawyer read them carefully through, looked at the plan of the mine, made a rapid calculation on a slip of paper, and then leaned back in his chair and looked at the doctor. 'I do not see your difficulty, Wynyard,' he said. 'If Captain Brock's calculations be right, and you can buy in at one pound, which, I believe, is the present price of the St Vrain's shares, and then run them up to twenty pounds, you will realise a fortune of some two hundred thousand pounds for Miss Brock, and twenty thousand pounds for yourself. Unless the old captain were mistaken, you have certainly fallen on your feet.'

'Do you think I am bound to invest the money in these shares?' asked Wynyard.

'Why should you not?'

'To tell the truth,' said the doctor, blushing a little under the keen eye of the lawyer, 'I am not quite clear in my own mind as to the honesty of doing so.'

'Where does the honesty come in?' asked the lawyer with a smile.

'Well, Walker, I thought over it last night, and I cannot see my way clear. If I buy the shares at one pound, those who sell them will get rid of them under the mistaken idea that their property is of no value; while I, the buyer, will know the contrary to be the case. It seems to me perilously like cheating. I think I should write to the directors and let them know what is likely to happen. After all, Captain Brock may be misinformed; at anyrate I am not disposed to force the market.'

The lawyer laughed. 'Suppose you see on a bookstall a rare old volume marked sixpence, would you buy it at the dealer's price, or offer him twenty pounds for it?' he asked.

'I don't know; I never considered such a case.'

'I will tell you, then,' said Mr Walker. 'You would undoubtedly buy the book for sixpence, and quite right too. What do you suppose makes prices on the Stock Exchange go up and down, except the dealings in them by people who act on private information, and use their knowledge in judging whether prices will rise or fall? I tell you it is one of the most ordinary transactions of business life, and I never knew any one discover dishonesty in it before.—You ask for my opinion, and I give it to you for what it is worth. The St Vrain's is, I believe, still solvent, though paying little interest on its shares, and therefore you are not likely to lose much by investing in it, even if the captain made a mistake. On the other hand, he was very possibly right, and in that case an enormous profit would be made—not quite two hundred thousand pounds, though, for your buying would send the shares up in the market. I should strongly recommend

you to carry out the testator's wishes; and indeed I do not see how you can well do otherwise, unless you refuse to act at all.'

'I should like to talk it over with Miss Brock before I decide anything,' said Wynyard.

'Do, by all means, then. If she is not tickled by the prospect of such a fortune, she will be a *rara avis* indeed! And I should say she knows about as much of business matters as you do.—Have you written to your mother about her?'

'Yes, I wrote yesterday, and ought to hear from her to-morrow.'

'Go, and tell Miss Brock what you have done then—that is, if you are sure of your mother's acceptance of the charge. You can talk to her afterwards of the money matters; and when you have settled affairs, come back and see me again; and I will put you in the way of getting a trustworthy stockbroker to negotiate your business for you when the will is proved. I won't interfere in any way with your market; but when you have purchased all your shares, if you will give me a day's grace before writing to the directors, I should like to buy a few shares myself and have a stake in the affair. That is the best practical illustration I can give you, as a lawyer, that my advice is *bonâ fide*.'

'I do not know what I shall do yet,' said Wynyard cautiously. 'But I shall certainly go to see Miss Brock at once and ask her opinion.'

'*Au revoir*, then,' said the lawyer. 'I consider the matter as good as settled, and look upon you with respect, as the prospective possessor of six hundred pounds a year.'

Six hundred a year! As Wynyard walked towards Cullercoats, the words kept ringing in his ears like a snatch from an old song. Six hundred pounds a year! Six hundred pounds-worth of comforts and luxuries for himself and his parents; a flourishing London practice, the power of attending the lectures of the princes of his profession, and keeping himself well up to the mark in the medical science of the day. What a prospect for a clever, struggling provincial doctor; and all to be obtained by a course which an upright lawyer had just declared to be strictly legal and honourable! His doubts grew fainter and fainter as he neared the village, and by the time he reached the house to which he was bound, they had almost vanished altogether. And yet, curiously enough, when his ward came to meet him in her plain, mourning-dress, with her pure face and placid smile of trustfulness, those troublesome doubts began to haunt him again.

#### MATCHES.

MAY it not be said to smack of the wildest form of communism, the tacit understanding by which, among the brotherhood of smokers, any stranger, be his station or dress what it may, has the privilege of demanding from the casual passer-by the favour of 'a light?' Amidst the numerous attacks directed against the habit of smoking, and what have been not unfitly termed its allied comforts, from the time of King James's famous *Counterblast*, this one point seems to have escaped the ever-ready notice of the many opponents of tobacco—namely, the essentially democratic influ-

ence attendant on the indulgence in the weed. That the match-box, even indeed in some cases the tobacco-pouch, should be regarded as a sort of property in common, to be shared without a moment's hesitation on demand with any member of the community—that the right of an entire stranger thus to claim assistance should be so frankly acknowledged, is a feature the gravity of which, from a social if not a socialistic point of view, seems scarcely to have yet received due consideration at the hands of those who mark the signs of the times. We check with becoming sternness anything like the approach and familiarity implied in the chance remark, however interesting, of an unintroduced stranger; we resent as impudent in the last degree any appeal to our purse even when made in the name of charity; there are some of us, indeed, who impart, or would seem to impart, with no small share of suspicion any information, in answer to a request from a stranger as to the direction of a certain street or house; but the simple appeal to 'oblige with a light' is received, if not invariably with the most courteous of affirmatives, at least, if it is in one's power, with the required favour. Those who are far too well acquainted with the world and its prejudices to court anything approaching a snub through the usual modes of address, are aware that the request for 'a match' or 'a light' will never receive anything but a civil answer.

Those excellent people who are for ever inquiring into the causes and origin of everything about them, will of course explain the universal custom among smokers of thus freely affording assistance to each other in the matter of matches, if not exactly by some still surviving relic of the cult of our fire-worshipping ancestors, at least by the tradition handed down to us from those days, far nearer our own times, when the difficulty of obtaining a 'light' caused it to be a positive kindness for those in possession of the sacred fire to impart it to their less fortunate neighbours. When our grandfathers with their flint and steel chipped their knuckles over their tinder-box, as the frugal French peasantry to this day continue to do, in order to evade the extravagance of the costly and too often harmless matches of the *Régie* monopoly; when the later dangers of thrusting a sulphur-tipped stick into an explosive bottle are recalled—for friction-matches have been known but half a century—the offer of a 'light' was indeed a service, and the tradition has still been retained. When the trouble of striking a light at that not very distant time comes to be remembered by those who nowadays enjoy the luxury of purchasing matches at three-half-pence a dozen boxes, something of the free-masonry which still survives among the smoking community in the matter at least of 'a light' can be easily understood. The custom, it may be observed, is universal. 'Pardon, monsieur; un peu de feu, s'il vous plaît,' is a request which throughout republican France is as freely acceded

to as the appeal for *fewer* throughout aristocratic Germany; or the less courteous, though substantially similar salutation of America: 'Say, boss, have you a light about you?'—'Ain't only on ye, only on ye?' was the plaintive appeal of one of Leech's miners to a group of his 'pals;' and the bearings of his somewhat singularly expressed request were completely grasped by the group of bystanders.

The smoker is acutely aware of the sufferings of a brother whose pipe is filled, or whose cigar end is ready bitten or cut off, but whose inability to obtain a light robs him of the ineffable delight of a puff. Those who do not smoke, it is asserted, cannot enter into the subtle sensations and emotions which attend the indulgence in the weed; and it is perhaps with something of a savage delight—modified by the variations of individual character—that on occasions such as these the non-smoker grimly informs the stranger that he 'can not oblige with a light.'

Fortunately, by a tacitly accepted code of modern manners, it is understood that the appeal for the favour of a match, even when acceded to, is not to be regarded as the prelude to any further intimacy. Now, in the past, and indeed to the present hour, the offer of a snuff-box was, and is, a distinct invitation to further intercourse, only to be repelled by a stern refusal to share in the titillating pleasures of a pinch. How the social and conversational distinction between the appeal for a match and the offer of a snuff-box came to be so well marked, is a question difficult to accurately determine. The attention of a 'light' costs so little, that the humblest outcast is thus enabled to oblige the wealthiest millionaire, who is not ashamed in the hour of need to thus show his dependence on the generosity of others. The cheapness of matches is a point which is astounding. When it is remembered how many processes—some thirty to forty—each box of matches has to pass through before it is ready for use, it remains, indeed, to all but those acquainted with the details of manufacture, a matter of surprise that so acknowledged a public boon should be obtainable at so small a rate. How deep is the interest of the community at large in the question of matches is shown by the unpopularity which it will be remembered attended Lord Sherbrooke's ill-judged attempt, some years back, to place, after the fashion of France, a tax on the domestic match. Fiscally, the till then popular Chancellor of the Exchequer showed his acumen, for the average consumption of matches has been reckoned in Great Britain alone at eight daily per head. The storm raised by Mr Lowe's proposal was, however, such that the obnoxious measure was removed, or else, doubtless, we should have seen disappear from our domestic manners one of those rare acts of simple courtesy which seem common to all sections of society.

After all, these are the little kindnesses which tend to lessen the asperity of those class distinctions which nowadays, it is commonly asserted, are being on every side broken down. Without such cheaply afforded favours, perhaps the bad feeling which some among the community are for ever sedulously stirring up, would be more openly expressed. If that is the case, there is no cause to regret or to fear the harmless form

of communism which, among the large and seemingly increasing numbers that enjoy their weed, has come to regard the match-box as property to be enjoyed in common.

### GHOSTS ABOARD.

THE *Valiant* was her name. Who had christened her, and how she came to be christened a name so peculiarly inappropriate, we cannot say. She was a tub, if ever there was one. Such craft as she, they build by the mile, and saw up into lengths. A floating coal-box, painted black, with an engine and a couple of boilers, a rudder and screw, some tarred rope and a score of seamen of all nationalities and no manners: there you have the *Valiant*, and the thousand-and-one ships of the same ilk which fetch and carry the riches of the world. And that is the kind of ship, a warehouse afloat, that you may cram with cargo from keel to hatchway, which, if money is to be made out of the service, makes it; a thing of ugliness, and a joy for ever to its owners—not by any means to its crew, by the way—which can be worked from port to port at a minimum of cost and a maximum of profit. Provisioned anyhow, rammed full of cargo, manned in haste with a crew scraped off the streets, no sooner is she fairly afloat, than first this thing gives, then the other; a boiler-plate is sprung, a bolt parts in the rudder chain; but she pegs away, patched and repatched out of all recognition; and, if trade is fairly alive, pays a free-board dividend of fifteen or twenty per cent. a voyage.

On the 12th of February we cleared out of the Tyne, loaded to the muzzle with coal, and bound for Venice. We had a river pilot aboard, of course, and were dragged out to sea, through the double line of buoys and the crowd of shipping, by a little coffee-pot of a tug. It was getting on in the afternoon before the last of the coal had been whipped into us, and we were in a frantic haste to save the tide. Our decks were about as foul a sight as you could have set eyes on. The men were groggy and in the sulks, as men always are at the start of a fresh voyage. The chief officer, Mr Marks, was in command, for our new cap'n had not yet arrived from Newcastle. We were to lie out down the river, and the tug would fetch him off when it brought us our fresh meat. Mr Marks was parading the bridge in his longshore clothes and tall hat, jammed fast on the back of his head, for there was a pretty brisk wind blowing in from the sea, that seemed to promise us some nasty weather outside. He was an elderly man, this Mr Marks, with a patient eye, and a sandy goat's-beard. Mr Rubble, the second mate, was a squat little man, heavily bearded, who had run away from home to follow the sea, and had never ceased regretting it ever since, for, after 'bucketing' about on a three years' cruise, he found himself too much of a salt to be happy ashore, and too heartily sick of the sea to be contented afloat. For the rest, our ship's company consisted of a motley crew of twelve seamen, half-a-dozen stokers, three engineers, a steward, a cook, and a cabin lad. A regular old seadog was our bo'sun, Jack Dredge, stumpy and square, his brown weather-battered face framed in a ragged fringe

of whisker; one eye had foundered in his head, and there was nothing left but an eyelid and a hole. The ball of it had been bitten one night in his sleep by a famishing rat, and had festered and sloughed out. He was in mid Pacific then, and the nearest surgeon a thousand miles away. He was of a taciturn disposition, and I fancy his temper had been damaged in the West Indies by a too liberal allowance of pepper in his curry. In his last spell ashore—he was a native of Newcastle, where his wife and his lad Bill lived—the Salvationists had got hold of him in the midst of one of his tremendous drinking bouts, and had excited him into a state of religious frenzy, and in this temporary exaltation he signed the pledge, and, amid a whirlwind of applause, fetched a bottle of rum out of his pocket, and, smashing it on the platform, solemnly executed a hornpipe on the relics. When he came to his senses next morning and remembered what he had done, he swore at himself like a hurricane, but kept the pledge, though he maltreated fearfully a zealous 'captain' who called about breakfast-time to see how their seafaring proselyte was progressing.

Well, we hove-to down the river just where we could feel the lift of the sea under our keel, and waited for the return of the tug with our skipper. The sky was banked-up with clouds, and a pretty stiff wind was piping in from the nor'-nor'-east. The steam was at high pressure, and blowing off from the wastepipe by the funnel. We were a little more ship-shape, for the men had been swabbing and swilling the coal-dust from the decks. At last the tug steamed alongside, and Mr Marks received the skipper as he swarmed up the rope-ladder, followed by his portmanteau and umbrella. He was a dapper little man, and came aboard smoking a cigarette. By the time the fresh meat had been passed across into the doctor's (the sailors' sobriquet for the cook) hands, the pilot was ready to leave us.

'Well, good-night, cap'n!' sang Master Pilot, as he clambered over the side—'good-night, and bong voyage!—Below there! steady!'

The ropes were cast off. The engine-room telegraph was rung—'Slow ahead'; and as she got way on her, the *Valiant* was headed for the sea.

It was a dirty night, and not a vestige of moon. The sea was not very heavy; but it was getting up under the nor'-easter, and there was every sign of a wicked gale brewing. As storms go, it is a toss-up between a nor'-east squall and a sou'-west gale for downright viciousness. But to fight a nor'-east gale in the German Ocean, aboard a coal-hulk, with your lee-shore all shoals and sandbanks—well, there aren't many things we wouldn't rather do, if it were a matter of choice instead of sheer necessity. Every now and then would come a whiff of rain, and there was no dodging it, for the weather-cloths had not yet been rigged up round the bridge. A quiet pipe, smoked in the hollow of the hand, was the only solace in the dreary night-watches. Steering south-south-east, we got Whitby Light abeam at midnight, and at two A.M. the log showed a run of sixty-four miles. The skipper was up and about all night, on the alert for the shore-lights; and though at first

he seemed a bit of a dandy, he was a seaman to the backbone. Day broke at last over a tumbling sea. What with keeping the watches, overhauling the decks fore and aft, battenning down the hatches, and making all ship-shape, there was plenty to do on that first day at sea to keep us from thinking too fondly of the girls we had left behind us. There was not a patch of sun to be seen; nothing but cloud and sea, sea and cloud. And the wind came screeching from the nor-east, swirling the rain and spray about our decks. It was a bitter time that day for the officer of the watch, oilskins notwithstanding. But the men seemed the better for their wetting, and the cheerier; the fit of land-sulks was tumbled out of them; and when the Swede Jansen, slithering cautiously along the wet iron deck for'ard with his kid of pea-soup and potatoes under one arm, was capsized by a sudden lurch of the ship, he and his dinner rolling away to wind'ard, the men waiting their turn at the galley-door sent up a shout of laughter and bellowed stentorian sea-jokes from hollowed hands after their unfortunate messmate.

Hour after hour the *Valiant* pegged stubbornly along, plunging down the green slopes of the waves, and raising herself heavily out of the troughs of the sea. She rolled excessively, and laboured up the waves in a reluctant way, which was far from inspiring confidence in her seaworthiness. At two P.M. we passed the Cromer Lighthouse, and it was an hour and a half afterwards before we got the Haslow Light abeam. At four, Mr Rubble turned out for the first dog-watch, and soon afterwards a man brought the side-lights aft and fixed them in their sockets. Then, after a second trip for'ard, he returned, nursing the binnacle-lamp in his arm. It was Smith who brought them, instead of the bo'sun, whose duty it is to look to the compass lights. Mr Rubble was too little of a martinet to have troubled himself about so small an irregularity, had he not been irritated by the clumsiness of the man's efforts to adjust the lamps.

'Where's the bo'sun?' he shouted into Smith's ear, for the wind and sea were making a great uproar. 'Why hasn't Dredge brought these lights himself? What does he mean by sending you with 'em?'

Still fumbling at a lamp, Smith bellowed in reply: 'Dunno, sir!'

But there was a look in his face, shy and glossy with rain, which gave the lie to his words. Mr Rubble noticed the tell-tale expression, but did not stop to give it a second thought. Taking the lamp from Smith's blundering fingers, he dismissed him, and fixed it in the binnacle himself.

At four bells the first-mate relieved Mr Rubble; and the latter dived below to get his tea and a snatch of sleep if possible before it came his turn again for Mount Misery (sea-slang for the bridge). With his hands deep in the dogeared pockets of his pea-jacket, and his shoulders hoisted well up to his ears, Mr Marks paraded to and fro, thumping his feet down, to keep the blood in them from stagnating. Every now and then he peered ahead into the stormy darkness, on the lookout for the Shipwash Light, which was due to come up some half-dozen points off the starboard bow. Every now and then he stepped aside to consult

the compass, to satisfy himself that the ship was being steered her proper course. Once, as he stood staring ahead across the tumbling black seas, the door of the fo'c'sle was suddenly opened and a shaft of light streamed out on the deck for'ard. The figures of two men came out darkly against the bright background for a moment, and then were lost in the night again. As far as Mr Marks could make out, there seemed to be some unusual commotion in the fo'c'sle. He changed his position, and went over towards the spot where Duckworth stood, shifting his quid and the spokes of the wheel.

'Anything wrong for'ard, Duckworth?' shouted Mr Marks tentatively. 'Are they quarrelling, d'you think?'

The man glanced down at the distant open door of the starboard fo'c'sle where the seamen were quartered, and put the wheel over some half-dozen spokes before replying, which he did without looking up at the mate: 'I don't know as they are, sir. Maybe it's the bo'sun as is took bad again and frightenin' of 'em.'

'The bo'sun?' bellowed Mr Marks. 'Why, what's the matter with the bo'sun?'

'I dunno, sir,' shouted Duckworth, stolidly minding his business at the wheel. 'He was took bad this afternoon—in his 'ead—and said as how he 'eard voices a-callin' of him; and some o' the boys j'ined in, and said as how *they* 'eard 'em, too, a-callin' of the bo'sun; and he turned in at eight bells and jammed his 'ead under the pillar to shet out the voices, and wouldn't turn out again for no one.' Only fragments of Duckworth's narrative reached Mr Marks' ears, for the din of the storm was terrific.

'Voices?' shouted Mr Marks interrogatively. 'What d'you mean?'

Before Duckworth could shift his quid to reply, a head and a pair of shoulders appeared above the ladder and stopped, not daring to trespass on the privacy of the bridge. The mate went over to see what the man wanted. It was the Irish sailor, and his jolly red round face was wet with rain and white with fear. He was dressed only in trousers and shirt, and the latter was unbuttoned and flapping in the wind.

'What do you want here?' shouted Mr Marks savagely, irritated by these irregularities. 'And what are you men up to in the fo'c'sle? Do you want to get yourselves reported to the cap'n?'

'Av ye plase, sorr,' shouted the Irishman huskily, 'the boys asked me to come and tell ye there's sperrits aboard, and the bo'sun's clane gone mad.'

The mate caught the word 'sperrits,' and jumped to the conclusion that the men had smuggled some liquor on board and were drinking themselves crazy. 'Spirits?' he roared back. 'Which of you has got 'em?'

The man shook his head. 'It's not them sperrits, sorr, worse luck—it's voices; and the bo'sun's clane gone mad. For the love av heaven, Mr Marks, come for'ard and spake a word to the boys.'

Telling Duckworth to keep a sharp lookout ahead while he was away, the mate ran quickly down to the deck, with Grady at his heels. It needed a good pair of sea-legs to avoid being wrecked against the hatchways or capsized into

the scuppers. They had almost reached the fo'c'sle, when suddenly the mate felt his arm grabbed by the Irishman, and turning on him, saw Grady's face ablaze with excitement. 'Did ye hear that, sorr?' cried the man. 'It's them sperrits again! There, sorr, just listen to that!'

If Mr Marks' hearing had been as keen as his sight he might have been more impressed by the cry, wild with seeming agony and faint with distance, which penetrated even the roar of the wind and the ceaseless thunder of the sea. But Mr Marks' hearing had been damaged by partial drowning off the coast of Spain, and though he listened intently, he heard no voices except those of the ocean and the air. Naturally concluding that Grady was drunk, he laid hold of the man by his beard and shirt-collar, and shaking him savagely, flung him down, aided by a leeward roll of the ship, under the wheels of the donkey-engine, and almost toppled after his victim himself. In no palavering mood, he went on to the fo'c'sle and stepped inside. It was very evident that there was something wrong with the crew. The men were huddled together by the stove, some in streaming oilskins, some only in shirts and trousers, all looking scared and all silent. In the middle of the place Dredge the bo'sun stood, half clothed, with a queer wild expression on his gnarled face, listening hard for something or other. The eyes of the men were all fixed on him. As Mr Marks stepped in out of the wind and rain, the bo'sun shouted hoarsely: 'Hark, lads! He's callin' of me again! It's him—it's the Bill!'

This time the mate heard the cry, or thought he heard it, for it was very distant, and was carried away again in the thunder of the gale. But he elbowed the idea aside roughly; it was so impossible for any human being afloat on such a sea to make himself heard above the roar of the storm. 'What's all this tomfoolery about?' he demanded of the men angrily.—'And what's the matter with *you*, bo'sun? You ought to be ashamed of yourself, playing the fool in this way.—Bo'sun!'

But the bo'sun heard nothing of the reprimand. He was eagerly listening for the recurrence of that cry; his fists were clenched, and the veins on his throat stood out like cords. And when that sound of human agony came wailing out of the storm again, his battered face lit up with a passion of love, and crying aloud, 'It's Bill! it's Bill! I'm comin', lad, I'm comin'!' he made a bolt for the deck; but Mr Marks stopped him, and they came down together. A couple of men pulled Dredge off the mate, and helped the latter to his feet.

'The man's drunk or mad,' gasped Mr Marks, fetching his breath heavily after the shock.—Dredge had retreated up the fo'c'sle—'mad or drunk. How has he come by the liquor? And who's this Bill he's raving about?'

'Bill's his on'y son, sir,' said one of the men in a scared way. 'And the lad warn't well when we come out o' port, and bo'sun he thinks as he hears the lad callin' of him for to help him or suthin'. Nor it's not all tommyrot neither, Mr Marks, for we've heard them voices ourselves.—Haven't we, boys?'

'Ay, ay,' chorused the men, wagging their

heads; 'heard 'em ourselves, we have, and more nor once.'

But as he had been absent already far too long from his post, and as it was beneath his dignity to bandy arguments with the crew, Mr Marks poohpoohed the matter; and after warning them to keep an eye on Dredge, and not to dare to hear any more ghostly voices at their peril, went aft again to the bridge.

When the second-mate relieved him at eight o'clock, he recounted briefly what had happened, and advised Mr Rubble to keep a sharp lookout on the fo'c'sle, and if any further commotion occurred, to let the cap'n know at once. 'I'll take a trip for'ard before I turn in and see that all's quiet,' he added as he left the bridge. 'And if there's any more knocking down to be done, I'll be ready for it this time.'

Everything was quiet, however, except the weather. The *Valiant* staggered along on her course, creaking, throbbing, groaning. At four bells the lookout man came to serve his turn at the wheel, and the other went for'ard to the fo'c'sle-head. Towards eleven, the wind lulled down a trifle, and a patch of moonlight mottled the sombre clouds; but the sea was still running mountains high and pitching tuns of water into us fore and aft. Mr Rubble had quite forgotten the incident which had occurred in the chief-mate's watch, and he was beginning to long for his bunk, when he was startled out of his drowsy complacency by the sound of a wailing cry, thin and distant and agonised, which the wind seemed to bring to his ears out of the storm and the night. The man at the wheel had heard it too, and turned a frightened face on the mate. 'Lord save us!' exclaimed the man, 'it's that there voice again!'

The words were barely spoken, when the door of the fo'c'sle was flung back and a crowd of figures swarmed out on deck. Then the door of the firemen's quarters was opened, and three men came out with a lamp. Seeing that something was amiss, the mate hurried down the companion-way to the cabin and roused the skipper. Captain Lawson was on deck promptly, and after hearing Mr Rubble's huddled narrative, requested him to return to his duties on the bridge, and went for'ard himself.

The men were all congregated under the shelter of the weather-bulwark, one or two standing, the rest crouching down together, like a lot of sheep. They had turned out in all sorts of haphazard clothing, and most of them in bare feet. They were all sulky and scared and silent, except one of the firemen, who was relieving his feelings in the choicest language of the stokehole. The skipper was among them before they were aware.

'Now, my men,' he demanded briskly, 'what's all this nonsense about? Who gave you orders to turn out and lie around on the decks in this way? Where's the bo'sun?'

One or two drew in their legs timidly, but nobody attempted to reply.

'Well?' sharply interrogated the skipper. 'Is the bo'sun among you? Why doesn't he answer?'

Silence. The light of the fireman's lamp 'glinted' on a small bright object in Captain Lawson's hand. The sight of it brought the

carpenter to his senses, and he shouted sulkily: 'Bo'sun ain't 'ere, Cap'n Lawson. He's mad. And no wonder neither. It 'ud drive me mad mysel' if I was to pass another night in that there fo'c'sle. Why, the ship's 'aunted!—There! listen to that!'

Again the faint despairing cry made itself heard above the roar of the waves. The wind seemed to bring it, and the wind swept it away again. Its weird agony awakened something of a superstitious dread even in the skipper's mind. The men covered closer together.

Leaving his crew where they were, the captain made his way to the starboard fo'c'sle, and called the bo'sun by name. No answer. Then he entered the alley-way, and walked up the length of it. Behind the stove at the far end he found the bo'sun, huddled down on his haunches, in nothing but his sleeping shirt. The man was staring, stark mad. His one eye was bloodshot and wild, and the other empty pit glared up darkly. The skipper was no coward, yet at the sight of that half-naked madman he quailed a little, and felt sorry that he had found him; but only for a moment. He stepped quickly past the stove to lay hands on Dredge, and as he did so, once more that wailing voice bore through the storm its message of infinite, helpless agony. At the sound, Dredge leaped to his feet, and crying out loudly, 'It's Bill as is callin' of me! I'm comin', lad—father's comin'!' burst out of the fo'c'sle and away across the deck, and was up on the lee bulwark and over the side in a flash. The skipper made a rush for the door, to attempt to secure the fleeting figure, but in vain. Just for half a second the madman was visible in his fluttering shirt on the reeling bulwark, and then went over into the darkness and those tumbling seas.

Mr Rubble saw the deed from the bridge, and springing to the telegraph, rang the ship to a full stop; and then, whipping out his knife, ripped and sawed at the cords with which the lifebelt was lashed to the bridge-rail, and dashing down the ladder to the after-deck, flung the belt overboard from the stern. But, of course, it was trouble thrown away. And even if a boat could have lived in such a sea and found men to man it, the bo'sun would have drowned three times over before we could have got one lowered and started out to find him in a waste of black and stormy waters. After wallowing about some ten minutes or so for decency's sake, the skipper rang the ship under steam again, and we slowly drew away, leaving the body of our bo'sun tossing somewhere in our wake.

Neither threats nor cajolery could get the crew back into the fo'c'sle. The skipper talked about 'mutiny on the high seas,' and even vapoured a little with his pistol; but the men were stubborn and refused to budge. Breakfast over, they came aft in a body while the cap'n was on deck, and respectfully but firmly demanded to be set ashore at the nearest port. The ship was haunted, said they, and no good would come of sailing in her, and sail in her they would not. The cap'n told them that he could clap every manjack of them in jail for three weeks, to which they replied that they preferred jail to a haunted vessel.

Well, like a reasonable fellow, the skipper gave

in, and we ran for Harwich there and then; put the men ashore without a cent of wages among them; wired details to our owners; officially reported the bo'sun's death; shipped a fresh crew, and were out again and fairly on our way inside four hours.

That was the last of the voice. Neither out nor home did we hear any more talk about the ship being haunted. We made a prosperous run, and were docked again in the Tyne before the seventh week was over. Then the secret came out. The *Valiant* was scraped and painted, and ransacked and repaired from stem to sternpost. In that narrow den called the forepeak, which serves as the ship's lumber-room, beneath a mass of old iron cables and rusty cordage, we found the corpse of a lad withered to a mummy. The rats had been at him too, and his feet were gone. Beside him there lay an empty meat tin; and in one of his pockets was an old silver watch with this inscription on it: 'To BILL, with Father's love.' It was the bo'sun's son. The poor fellow had stolen aboard as a stowaway; for, being a sickly lad, his father had been strongly against his following the sea. In the storm, the plunging of the ship had shaken down upon him all the lumber in the forepeak, and he had screamed for his father till he died.

## SINGLE-RAIL RAILWAYS.

The single-rail railway has been a constant ambition of the inventor, for whom no little fascination would appear to attach to attempts to devise a system of locomotion carried on one instead of two lines of rails, to judge by the frequent endeavours to solve the problem and to place it on a sound and practical commercial basis.

Nearly half a century ago, the project took shape in a rail carried on elevated posts, equal loads being slung on either side of the carrier-wheel from projecting arms. The arrangement was, however, deficient in stability. Since that date, many schemes have been brought forward, from ingeniously designed arrangements in which equilibrium is secured by the addition of a small guide-rail on either side, the whole details of which have been worked out with great care and accuracy; down to the simpler form of a one-wheeled cart running in a groove formed by hollowed logs, supported on either side by men or beasts, and designed for South Africa, under the name of the Cameron Pootoon Cart. In each and all, however, the principle involved remains unchanged.

Passing over the Meigs system, which was specially designed for overhead lines, and with a view to modify the inconveniences resulting from those now working in New York; passing over, also, the Larmanjat system, which, though obtaining some footing in France and Portugal, has failed as yet to give practical results sufficiently satisfactory to hold its own, we come to a scheme recently placed before the public, and known as the Lartigue system, which, from the complete and energetic manner in which its inventors have carried out their conception, merits some passing notice. The rail is carried on iron trestles, of the form of the letter A inverted. Both engine and carriages sit astride the rail, equili-

brium being insured by two small guide-rails, one on either side of the trestle, and about a foot from the ground. Two classes of lines are constructed—a heavy permanent line for fixed traffic, and a temporary one of lighter design, readily movable. The advantages of a light railway weighing only some fourteen or fifteen tons per mile, and costing, according to the estimates, only some three hundred pounds per mile, in farming operations will be readily appreciated; easily shifted, it is quickly re-erected to follow the crops; whilst one horse alone drawing the little trucks on their single rail, will, it is calculated, do eight times as much work as if dragging his load over the ground.

An elevated railway standing some three feet above the ground has a decided advantage over a surface line in countries subject to sand-drifts or heavy snows; as an example of which it may be stated that in Algeria, where the esparto business requires a ready means of carriage across the sandy plains, the Lartique railway is viewed with favour, and has done good service. The single rail, again, allows sharper curves than are admissible even on the narrowest gauges; and where minerals, &c., have to be brought down mountain slopes by zigzag routes, the advantages of the system make themselves apparent. For military purposes, the readiness with which the Lartique railway can be installed, and its general portability, will at once occur to the reader. The employment of trestles of different heights to carry the line affords a ready means of dealing with inequalities of ground, and also minimises the difficulties of crossing ditches, ravines, or brooks. Traction can be effected by manual or animal power, or by steam, compressed air, or electric locomotives, to suit the special requirements of the case.

At the present time, when cheap transport both for men and goods forms a leading problem not merely at home but in the development of our colonies, every attempt to improve the present systems of locomotion is worthy of careful attention and judicious investigation.

### POWDERED MILK.

AN attempt now being made to introduce powdered milk—that is to say, milk reduced by evaporation to the solid state, and sold as an article resembling sugar both in form and appearance—merits some notice, when account is taken of the important position held by milk amongst the necessities of daily consumption. The process adopted for the proposed conversion may be briefly sketched. Fresh cow's milk having been treated for the removal of a portion of its cream, is placed in a vacuum pan, surrounded by a water-jacket or outer vessel charged with hot water. The milk is gradually reduced to a viscid substance, of the consistency of ordinary condensed milk. Granulated white sugar is now added, to render the mass sufficiently friable, and the temperature is lowered some twenty or thirty degrees, to prevent any discoloration or loss of flavour in the powdered milk. Nothing further remains but the removal of the contents from the vacuum pan, which can either be distributed in the form of lumps, or as a granulated powder, after grinding in a revolving burrstone mill. The apparatus employed consists essentially of a copper vacuum pan connected with an air-pump capable of pro-

ducing the requisite vacuum; a water-jacket surrounds the vacuum chamber. A pipe, furnished with a stop-cock to regulate the supply, delivers the fresh milk direct into the vacuum pan, whilst an air-tight door is provided for the removal of the solidified material. A circular shaft running through the pan is furnished with stirring arms and scrapers for actuating and mixing the viscid milk; and is driven by suitable belting or gearing. The water-tight jacket is furnished with three pipes, giving admission to cold water, hot water, and steam respectively, so that the requisite heat can be maintained and regulated with the greatest nicety. An overflow pipe is also provided.

It is claimed that powdered milk possesses excellent keeping qualities, and that samples exposed to moist air at a temperature of one hundred and twenty degrees Fahrenheit have, after many months, been found unaffected either as regards flavour or appearance. The process is by no means confined to cane sugar for admixture with the milk; malt or grape sugar will produce results equally satisfactory. Powdered milk is well adapted for addition to tea, coffee, chocolate, and other kindred beverages; whilst that in the form of lumps will be found convenient for many purposes.

The manufacture of instantaneous beverages should receive an impetus from the invention now under discussion, for milk in powder-form can now be added to extract of coffee, powdered chocolate, or cocoa.

The uses of milk for cooking purposes are too well known and appreciated to need any special enumeration; the reader will readily perceive how valuable the invention must prove itself in all culinary arts; whilst travellers both by land and sea cannot fail to avail themselves of the new article.

### THE GREAT NORTH SEA.

YEARS have passed since the great North Sea  
Took him who was dearest on earth to me.  
Safe in God's keeping I know he lies,  
And he hears not the seabirds' moaning cries,  
As slowly over his grave they float,  
With the drifting wind; and never a boat  
Or a sign of mankind is there,  
Only the wild waves' ceaseless prayer  
Sounds ever above his quiet bed,  
Till the day that 'the sea gives up its dead.'  
The mist comes down and it hides the sun;  
But naught he knoweth—his work is done.  
Storm and tempest, they come not nigh  
The graves of the ocean, and never a sigh  
From the world far above them can break the sleep  
Of the dead who rest in the measureless deep.  
Thus for ever, until the latest morn  
Shall roll back the last time the darkness forlorn,  
My love in the clasp of the great North Sea  
Waits, till the ending of time shall be.

## CLIQUE.

THE sentiment so tersely expressed by the miner in Leech's inimitable sketch, suggesting to his companion to 'eave 'arf a brick' at a passing stranger, has found, in a modified form, an echo, at some period or another, in every human heart. The spirit of clique, of clannishness, or whatever name it may bear, is one which is common to humanity at large, a relic, probably, of the state of aggressive self-defence which formed the existence of our primitive ancestors. As introduced into every-day English, the word clique is essentially modern; but it represents an institution the age of which it would be impossible to determine. Did it not sound perhaps somewhat irreverent, it might be suggested that in the pre-Adamite era the fate of the fallen angels, so dramatically related by Milton, could be traced to the spirit of clique, one which would seem to be inherent in all living nature. Sir John Lubbock, in his interesting series of studies on the Intelligence of Ants, has shown us that the same feeling actuates insect life; the members of one anthill, even when separated by a year's absence, being, we are assured, promptly recognised, or assisted in trouble, by their comrades, where an outsider or a stranger would be mercilessly and instantly despatched. It is this same feeling which in savage life explains the animosity of tribe against tribe, reflected to our own day in the familiar *vendetta* of Corsica, or the blood-feuds which the criminal records of the United States show to exist in the New World in that vague and extensive land of opportunities known as 'Out West.'

From the altitude of civilised existence, we are apt to stigmatised all such human failings as 'savagery,' forgetful that in our midst the same spirit survives, if scarcely with the same homicidal ferocity, at least with much the same intensity of feeling. We pride ourselves that the

contrast which marks our modern notion of civilisation and the social life of our more primitive ancestors, is the gradual disappearance and abolition of the tribal distinctions which in savage life are enforced with such stringency; we are seemingly unconscious that the spirit which on a large scale arms nation against nation, and in a less degree splits society up into a number of conflicting 'sets,' is a survival of a past when a general state of defensive preparation against outside attack constituted the normal condition of humanity, and each little clique of individuals thrown together by natural circumstances held it as a mutually accepted understanding to protect its members against interference from without. *Esprit de corps* is another of the euphemisms with which we designate the spirit of clannishness; allied to which is the even more subtle but none the less equally well-marked spirit that keeps up the rigid distinctions of caste not only in the East but among ourselves. Without that spirit, humanity in the past would never, probably, have survived; and even now, without its aid, the wheels of modern existence would scarcely work smoothly.

Of late, there has been quite a stir in the English world of letters on the subject of what has been termed literary 'Log-rolling,' an American variation—taken from the lingo of the emigrant pioneers—of our own less refined principle of, 'You scratch my back, I scratch yours,' a process which solely owes its origin to the spirit of clique; and the institution, called into question, has been ably defended by more than one brilliant writer. In literature, more especially in literary criticism, it would seem particularly difficult to avoid such influences, in spite of the apparently thick veil of anonymity which covers authorship in our country. In the ranks of the profession itself, the secrecy kept so profoundly from the world at large, does not exist, and Jones knows perfectly well that he can look

to Smith for a kind word when the occasion arises—a reciprocal arrangement which works equally for all the members of the particular clique to which they severally belong. In the arts, the principle is the same, whether an Exhibition is to be criticised or a play advertised.

It is urged by some that this friendly form of mutual admiration, which it seems impossible to avoid, possesses its advantages. What the exact morality of the arrangement may be, it is perhaps a little difficult to say. It cannot be denied that with its influence the truth is not always dragged from its modest hiding-place. It is impossible for members of one and the same set—mutually jealous, and aware of each other's deficiencies as they may be—men who have dined and wined together, to criticise each other as they might otherwise do, if not so deeply indebted to, rather, perhaps, so completely dependent on, each other.

As originally organised, clubs of course owed their existence to the spirit of clique. Men of one 'set' would gather together at some special place of entertainment, and only after due initiation would admit 'outsiders.' This was the simple custom of the past, of which many historical instances are familiar, possessing their existing parallels nowadays, though it is to be regretted that to a great extent we have broken in on the good old traditions. It is characteristic of modern existence that too many of our clubs are now each the centre of a numerous series of small coteries, the members of which are as distinct as mutual absence of sympathy can succeed in rendering a number of fellow-mortals who are only united by the selfish advantages they owe to a common annual subscription.

As for the dividing lines which separate society so sharply into its cliques innumerable, what need is there to do more than refer to so familiar an expression of the social sectarianism from the effects of which every one must have suffered at some time or other of his existence? In no direction is it possible to escape from the influence of clique. Every profession will be found to be divided into its various 'sets,' all completely divided. If, in the great cities, something of the influence of a daily existence in which so many incidents are common to all sections of society, tends to a slight extent to lessen the rigid exclusiveness of clique laws, those who live in the country, perhaps even more those who live in country towns, know how severely social distinctions are enforced, and at the same time how solid are the advantages accruing from the superior clannishness on which this spirit is based. Few things are more constantly the source of regret among certain members of the community than what are called the levelling tendencies of the age. Such pessimists may, however, gather comfort from the fact, that destructive as may be many of the effects of modern progress, the spirit of clique is too inherently rooted in human nature to be easily swept away by any political convulsions. That spirit is dependent on a natural craving for the moral and material support derived from association with fellow-mortals.

The feeling which dictates this sense of dependence possesses its excellent as well as its easily detected evil qualities. A state of social Ishmaelism would be indeed intolerable.

## RICHARD CABLE,

THE LIGHTSHIPMAN.

### CHAPTER XXXV.—'MAGPIE' BEER.

WHEN the rector appeared at the *Maggie*, Mrs Cable was pleased to see his genial face, but uncertain how her son would take his visit. She had no doubt that the message of which he spoke was one that would irritate him. In all probability, Josephine asked his pardon; but he was in no humour to grant it. Bessie Cable had ceased to speak to him about his wife. Any allusion to her, however slight, roused his anger; and the only way in which she could keep him quiet was to talk of future plans, or of what the children were doing—how they picked mushrooms on the downs and blackberries in the hedges.

She put her finger to her lips when the rector blurted out his purpose in coming, and beckoned to him to come in with her to the parlour. Then, when he had complied, she asked him to be seated, and standing herself respectfully, told him, with a distressed face and with the tears trembling in her eyes, how matters stood.

The rector listened to her, interrupting every now and then, because he could not keep his tongue quiet; and when she had done, he began to talk. He told her that her whole past history was known to him; and that in his opinion the time had arrived when Richard must be told who was his father, and what the wrong was that had been done to his mother. 'Leave it to me,' said Mr Sellwood; 'I will tell Richard; but when I stamp on the floor thrice, you must come up; I shall want you.'

'Please, sir, say as little to him as you can about his wife. It has become a craze with him that she is the occasion of every misfortune and trouble that has come upon him. He is an altered man—altered for the worse. I scarce know my gentle, loving Dick any more. I do even believe he has left off saying his prayers.'

'Let me alone,' said Mr Sellwood. 'I have mixed with all kinds of men and seen all sorts of humours, and I will deal with him discreetly.—Now, I will go up, or he will be suspecting that you have been priming me.'

'Will you take anything, sir, after your long journey? Shall I order you—some beer?'

'Beer!' exclaimed Mr Sellwood. 'On no account.' He dashed up the stairs. '*Magpie* beer—and in a week be lowered to teetotalise the county!'

'How are you?' exclaimed the rector, bursting into the room occupied by Richard. The stairs were very steep, almost like a ladder. He had gone up them fast, and precipitated himself against the frail door, that flew open before his weight. He came in like a blast of healthy cool wind that drives fogs and miasma away. His hearty red face, his cheery spirits, his crisp manner, had a momentarily salubrious effect on the sick man, whose brain was clouded with the

fever-fogs that rose from his festering heart. He put out his hand, and the rector shook it.

The rector was one of those men who carry with them wherever they go a sense of substantiality. Men in an uncertain position, pecuniary or social, have ever a crack in them. They cannot help it—it is inevitable. But the rector was a gentleman by birth, a man of private means, an incumbent in an established church, of hereditary orthodoxy, who no more changed his opinions than he changed his banker; who no more dreamed of insecurity in his position than he dreamed of giving up the *Guardian* or of going through a course of Zola. A man with an uncertain position is a man with a very thin skin, and he is always supposing that he is being tickled, or pinched, or impinged upon by those about him, wilfully, and he resents these touches as personal affronts. But a man who has been a gentleman since he fed out of a silver spoon as a baby, and who has never overdrawn his account at the bank; who, like certain Alpine plants, knows perfectly his own level, and that he will get frozen if he creeps above it, or stifled if he descends beneath it, is confident, thick-skinned, never imagines and resents a slight. He pities the unfortunates who do not appreciate his worth, and would help them freely out of his purse, however grossly they might have insulted him, should they need assistance. Such a man is a rhinoceros as to hide; not arrows or spears, only conical rifle bullets, pierce his skin. But the triple-hided rhinoceros is the gentleman incumbent in an established church, who knows that his tithes must be paid, and that nothing short of a revolutionary explosion can shake the establishment. Such a man imposes by his presence, by his confidence in himself; and when the rector burst into Richard's room, Richard, who was disposed to be angry at having been pursued from the east to the west by one of Hanford, was unable to look surly and turn his face to the wall and keep his hand in bed.

'Parson Sellwood,' said Richard Cable, 'I won't say that I'm not glad to see you; but if you come with a message to me, I must ask you not to deliver it. I can have no more communication with one who has hurt me past the power of forgiveness. I don't want ever to hear her name again. I wish I may never see her face. I curse the day that we met. She came to me in storm, and I put out my arms and took her into my vessel. And in return, she has pursued me till she has thrown me and my little ones out of our house, our home, cast us up, shipwrecked waifs, on a strange shore, and me flung out with an injury that will never be got over. That she has hurt my body, matters little—I could have forgiven that; but she has crushed and crippled also my child. Little Bessie and I are both wrecks; my home is wrecked, my happiness is wrecked, my faith is wrecked—and she has done it, she alone!' He turned his head away.

'Cable, my good fellow,' said the rector, taking a chair and seating himself in it a little way from the bed, where he could watch Richard, 'the message I bring you must be told.'

'I will not hear it.'

'The person who gave it me urged it on me before we parted.'

'Take it back to her unuttered. I throw it in her face.'

'I beg your pardon. The person is not a she.'

'What!—the message is not from my—from her?'

Mr Sellwood evaded a direct answer. 'As I came along on the coach, I had a most earnest message imparted to me to convey to you.'

'She has come! She is here! She is below!' almost screamed Cable. 'Let her not come near me, or touch one of my children!'

'The coachman was very particular that I should remember to advise you on no account to touch the *Magpie* beer. It is made with Epsom salts.'

Richard turned his head sharply round and stared at the rector.

Mr Sellwood maintained a face of the utmost gravity. 'Poor fellow!' he continued. 'It has disagreed with him; and having a warm heart, he pities you, and repeatedly sent this message to you by me—Don't drink any *Magpie* beer.'

Richard drew a long breath. 'This was all, was it?'

'The *Magpie* beer,' proceeded the rector, throwing one leg over the other and folding his hands and twirling his thumbs, 'is reported to be lowering; and my good friend the coachman believed that no one but a coastguardman could drink it long without becoming a teetotaler.'

Richard still stared at his visitor.

'The *Magpie* beer,' said the imperturbable rector, 'is held to be the real cause why Jacob Corye cannot fatten his young stock. Has he said anything to you about his calves and bullocks that he raises?'

'And rears,' interjected Richard, and sank flat on the bed. 'Too much. In mercy—I have had enough of that. I did not expect this from you, sir. My head turns. I pray you, none of this seesaw about raising and rearing and fattening.'

'You wish me to change the topic?'

'By all means, sir, or I shall go mad. That Jacob Corye comes in here with his pipe and his jug of beer.'

'Never touch it,' interrupted the rector.

'And talks of naught else but the raising and rearing and the fattening of young stock, till, in spite of my thigh, I think I must jump out of bed and run away.'

'Is it a fact that he feeds his young stock on beer?'

'I don't believe a word of it, sir.'

'Or that there is Epsom salts in his beer?'

'I've not tried it; I can't say.'

'When I heard of the properties of that beer—I was so troubled in mind at the danger you ran, that I came at once to see, to bring you the message and warn you of your danger.'

Richard raised himself in the bed slightly. 'Sir,' he said, 'I do not understand. You did not come all the way from Hanford to caution me against the *Magpie* beer—did you?'

'No. I cannot say that. The coachman spoke to me about it; but—as you ask *what* the real motive of my journey was, I do not object to tell you.'

Then Richard became agitated. 'I heard you speak down-stairs. You have a message to me from—from her. I will not receive it.'

'You need not,' answered the rector with placidity. 'But it does my heart good to hear you have not touched the *Maggie* beer. I have come here to talk to you about your father.'

'My father!' Again Richard stared at his visitor.

'You ran away from Hanford in such a hurry,' continued the rector, 'that those who desired to communicate with you after your father's death'—

'My father is dead!'

'And were at liberty to do so,' proceeded Mr Sellwood, 'had not the opportunity. I may tell you candidly that I have only recently learned the circumstances of your parentage—only since your abrupt departure. In the matter of his estate, which you may justly claim'—

'He was rich'—left money!' gasped Richard.

'Excuse me, Cable, but you are rather given to interrupt. When you turn a tap, a stream flows out; but if you put your finger in the way, an even flow is diverted into sprits and splashes. If you will allow me to tell the story in my own quiet way, without breaks, it will be more consequent, and easier for me to tell and you to follow.' Then he stamped thrice on the floor; and immediately Mrs Cable came up. 'I desire you to be present,' said Mr Sellwood, 'whilst I tell Richard your story, and concerning his own father, that you may confirm me when I am right and correct me when wrong.'

Richard looked uneasily at his mother. 'I do not wish to hear the story,' he said bluntly.

The rector understood him, and looking him steadily in the eye, said: 'It is a story which, though it tells of wrong done to your mother, tells of nothing but what makes for her honour.—She is a woman'—he rose and bowed to Bessie—'I could almost envy you to be able to call her your mother—a woman I always respected, one whom now I revere.' Then he sat down again.

Cable was touched, softened; he put out his hand to his mother and clasped hers. Their eyes met. The little cloud of doubt which had always hung on his mind was gone. His mother was irreproachable. He had felt it must be so, and yet he was not sure. Then he turned to the rector and said: 'Thank you, sir—thank you for that.'

'Now, Cable, you must listen to me patiently and without interruption—I hate interruptions—whilst I tell you the entire truth.'

Then he told Richard what he knew. It was the merest outline of a life-story, which Bessie could have filled in with a thousand particulars, but which were now unnecessary. Mr Sellwood told the story with delicacy, avoiding the slightest reproach on the memory of the dead man, casting the blame on his relations, perhaps exaggerating the pressure that was brought upon him to induce him to consent to the annulling of the marriage.

As Richard listened, his eyes were fixed on his mother, and his thought throughout was, what she had endured, and with what silent dignity she had borne her wrong.

'And now, Cable,' continued the rector—'now I come to speak about Josephine.'

Instantly, at the sound of her name the man's

face altered. He let go his mother's hand, and gathered up the sheet about his ears and shouted: 'I will not hear about her; I will receive no message from her. I would to God I could forget her!'

'Do not act like a child, Cable,' remonstrated Mr Sellwood. 'I must speak'—

'But I will not listen,' retorted the maimed man.

The rector looked at Bessie, and she at him. What was to be done?

Just then, up the stair came the host with a jug of beer in his hand. 'Well, I never!' exclaimed Jacob Corye. 'A parson in the *Maggie*! This is the first time this has happened. Well, sure, this is an honour; and sir—if I may make so bold—you'll drink the *Maggie* beer, and no better was ever brewed, to the good-luck of the house; and to the mending of the cap'n, you shall drink a second, and no charge for either.'

'My good friend'— protested the rector, backing.

'Nay; I'll take no refusal,' insisted Jacob. 'My beer is famous, and you shan't have to pay for it. First time a parson has come over my drexil [threshold] and stood between my derms [jams]. Drink, sir!—Nay, parson! Drain it to the bottom, to the good-luck o' the *Maggie*; and I'll fill it again to the mending of the cap'n's thigh. Now, sir!—Nay, drink away, to the last drop; there's more coming.—Now, sir, what do you say to *Maggie* beer?'

#### CHAPTER XXXVI.—YET.

Mr Sellwood walked back to his inn, carrying within him two jugs of *Maggie* beer, and the equally salt and sour conviction that he had failed with Richard. He had not been able to convey to him Josephine's message; he had not been able to tell him of her resolution to make over Gotham's property to him. He was in that touchy and obstinate state of mind that he refused to allow the smallest reference to his wife.

How the characteristics of the mother came out in the son under similar provocation! As, under the influence of pleasure or pain, of strong passion, of death-faint, likenesses never before noted appear on a face, so is it with mental and spiritual characteristics. Long years may pass without any resemblances having been traced, and then, all at once, the son, under exciting conditions or numbing sorrow, reproduces the modes of thought, follows the lines of his parents' conduct in similar situations. Bessie Cable had been silent for many years, burying her grievance in her heart, brooding over it, showing it to none; and now, her son, staggering under a blow, fell into the same course, and doggedly refused to allow her who had struck him to be mentioned in his presence.

The rector was a sanguine man. He buoyed himself in the confidence that everything would come right in the end; but he was forced to admit to himself that this end was a long way off in the case of Cable and Josephine. Those qualities in the man which had made him estimable before—his steadiness of purpose, his reserve, his self-respect, his patience in the midst of difficulties—combined now to impede a recon-

ciliation. He had taken his resolution, and would adhere to it with iron tenacity. He would confide his wrongs to no one; take counsel from no one, be swayed by no one. His galled dignity would harden into stubborn pride; his patience would make him endure every extremity without a murmur, rather than yield. Mr Sellwood saw that the task he had set before himself, and which had presented itself to him at first as easy, was one beyond his powers of performing. He went in a meditative mood to the telegraph office, and sent a communication to his wife at Hanford concerning those who had been lost in the wreck; but he sent none to Josephine. He did not know how to couch his message in a few words: He walked home to the inn and called for a drop of brandy, to correct the evil influences of the *Maggie* beer, and looked about for writing materials. He would send Josephine a letter. He speedily disposed of the brandy; but the letter was not so easily managed. What was he to say? That the Cables were safe, but that Richard had injured his thigh; that they had lost everything except a small sum of money that Richard had carried on his person, and which, therefore, had not fallen into the hands of the salvors. He might write this, but it would have the effect of bringing the impetuous Josephine there; he was sure of that; and the result would be to aggravate the estrangement. He had his pen in his mouth, biting the end of the quill and ripping the feathers off it with his teeth, with a puzzled and distressed look on his honest face, when the waiter opened the door and said that Mrs Cable wished to speak with him.

'Show her in,' said the rector, drawing a sigh of relief. Perhaps she could help him out of his difficulty: anyhow, her interview with him would delay the execution of his embarrassing task.

'Sit down, Mrs Cable—sit down. Just wired to Mrs Sellwood about the poor fellows. She will go round and see their families and break the news to them. She is a wonderful woman—wonderful in these painful cases—has such tact; I do not know what I should do without her.—Sit down; do.—I've—apologetically—'been taking just a drop, only a drop of brandy, neat; did not feel quite myself within. Had a good deal to upset me of late.' He pointed with the end of his pen at the little bottle and glass. A long curl of ripped feather hung from the quill. He had pulled it off with his teeth, in his perplexity, as if the solution to his difficulty was to be found under the outer cortical, as a woodpecker seeks its food under bark and moss on tree-boughs.

'I have been writing—that is, I have begun a letter. No. Upon my word, I have only begun to think about beginning one, and have got no further into it than "My dear Josephine." If it were a sermon, I should have got on famously by this time; but—I am pulled up at the very outstart. I can't get on.—I hope you have brought me something satisfactory, which I can say.'

Mrs Cable's handsome face was troubled. 'I suppose, sir, I did wrong harbouring my resentment against Gabriel for so many, many years; and now the chastisement has come on me.

Richard said that as he had maimed little Bessie, she had maimed him, and that this is a law. As I was unforgiving, so now is my son unforgiving. I was hardened for more years than I like to say, and I doubt if he will yield sooner. I am a woman, with a woman's weakness; and he a man, with a man's strength.'

'But then,' resumed the rector, 'it makes all the difference that your resentment was against a man, and his is against a weak girl.'

Bessie shook her head. 'Gabriel, heaven knows, was weak enough.'

'He never sought to make amends to you. Josephine is full of self-reproach, and is thoroughly in earnest in her desire for reconciliation.'

'It cannot be,' said Mrs Cable, after a moment's consideration. 'If he forgave her to-day, they would be apart again to-morrow. They have nothing in common; with the best wishes to be happy together, they could not unite. There's a way of the weft and a way of the woof in everything—in human natures, as in brown holland or silk velvet. If you join two pieces of the same material with the weft of one across the woof of the other, there'll be puckers for ever. You may wash and pull and iron to get them smooth; but you wash into fresh puckers, and you pull apart and iron into creases. I leave you to judge how it must be when you stitch together sailcloth and satin across each other's grain.'

'What am I to say?' asked the rector despairingly. 'I must write to Josephine. She is in great trouble. As for your theory, I don't hold it. There is give and take in all married life. Bless me! do you think Mrs Sellwood and I agreed together from the first like bread and butter? Cable and Josephine have not been together three months, and are they to fly apart at the first tiff!'

'There is give and take where the joining is between two cut the same way, weft or woof. Then when one pulls, the other gives.'

'Mrs Sellwood and I had our tiffs. Why—I remember distinctly the second week of our marriage, she—that is, I— Well, never mind particulars; we were both in the wrong. It was a rainy day, and horribly cold, at Mürren, several thousand feet above the sea, and in close proximity to glaciers. Nothing to do; no books but odd volumes of Tauchnitz; no heating apparatus in our room. I wrapped myself up in a *duvet* and stood at one window looking out into the rain; and she wrapped herself up in a *duvet* and looked out at the rain from another window; and we would not speak to each other. We were both cold, both cross, and both in the wrong, and ashamed, or too proud to own it. I thought then I had made a mistake in marrying her, and I believe a very similar idea lodged in her head. It was wet and clammy and cold in our room, that detestable day at the *Hôtel du Silberhorn* at Mürren. I know that I used my pocket-handkerchief, and so did she. We were all right again next day, when the sun shone. I got up early and picked her a bunch of Edelweiss and gentians; and she—she mended one of my braces for me which I had broken out. We made it up then.—I have no patience with Cable; he must come round. Why, he can't be in a more miserably uncomfortable con-

dition than I was that morning at Mürren, scrambling about after Alpine flowers—wearing one suspender!’

Bessie shook her head. The cases were hardly analogous.

‘Josephine is humbled,’ he went on. ‘There is infinite good in the dear girl; but she has been mismanaged—I will not say by whom. She has—she always has had a true and sound heart; but she has been allowed her own way too much, and permitted to exercise her temper without check. She is headstrong, because she has been almost forced by circumstances to decide on her own course for herself; but she is a true woman—a true woman,’ repeated the old rector, standing up. ‘I’m the last to conceal, to deny her faults; but—there is sterling stuff in her. She’s a dear girl, a good girl.’ He walked to the window and looked out. Presently he came back to the table. ‘Look here, Mrs Cable. Do you suppose that I have not had crows to pluck with Josephine? I do not mind confiding to you—but let it go no further—that I have had a crow as big as an albatross and as black as pitch to pluck with her. She hurt me where I am most sensitive to pain. Are you aware that my boy proposed to her, and that she refused him—threw him over for your Richard? A father has feelings. He is proud of his son, when that son is good and has not cost him an hour of uneasiness; and a father turns somewhat rusty against a young hussy who snaps her fingers in his face. But I forgive her. Indeed, I may say that I value her infinitely higher now than I did before.—Do you know those horrible little pieces of money one gets in Austria—ten and twenty *kreuzer* bits, of base metal washed over with silver? They look very well when new; but with use, the silver rapidly rubs off, and you get the tarnished brass beneath. A lot of women are like that; and the rub and turn about, the daily friction of married life, brushes away all the external gloss and plate. With Josephine, it is just the reverse—the brass is the outer work, and the sterling silver below. Why, is Cable to be angry and cast her away because of the brass? Let him take her and try her, and he will soon come on the precious metal.’ He rang the bell. ‘Excuse me; I must have another glass of cognac. That *Magpie* beer—two pints was too much. I shall be quite upset.—But, Mrs Cable, I leave it to you to reason with your son. He rolls himself up like a hedgehog when I come near and breathe a word about Josephine. He does not know what a treasure he has got in her. Tell him that I envy him his possession. I should be glad if my son had her instead.—Bless my soul! does he want his wife to be a turnip or a mangold? I suppose you never heard of Rübezah, the mountain spirit, did you? who carried off a princess, and to supply her with companions and ladies-in-waiting, transformed turnips into young damsels. Let me tell you, and tell Cable through you, that the manufacture continues at a brisk rate. I have met scores of young ladies who were, I could swear, nothing but transformed turnips. Josephine is not one of these; she has character—she is a real woman.—I am warm—it is not the brandy, it is my feelings which heat me.’

‘You see, sir, the difficulty is that both of them are strong-willed in their own ways.’

‘But Josephine is bent now on doing what is right.—Judge for yourself, Mrs Cable. When she learned who Richard really was, at once, without consulting me or Mrs Sellwood or any one, she made up her mind that she had no right to Mr Gotham’s property. She would not have Richard enriched through her, but be herself enriched through him. She makes over everything absolutely to him. Is not that a proof of determination and of right principle?’

‘In the first place,’ answered Mrs Cable, ‘let me say that I am quite sure Richard will not accept the property. I would not myself touch a penny of it; and he shares my pride. If his father did not choose to acknowledge him, Richard will accept nothing of what he has left. I am as sure of that as if I heard Richard say so.’

‘But—will not Josephine’s disinterestedness touch him? He must see how right-minded she is.’

Bessie shook her head. ‘Mr Sellwood,’ she said, after thinking deeply for a few minutes, ‘I allow she must be strong to decide to do this. But strength in her will never touch Richard and bring him to take her in his arms again. It is weakness, and not strength, that appeals to him. He is a man with the heart of a mother. You do not understand. A mother will let herself be cut to pieces rather than that the feeblest child she bears should be hurt. The feeblest child, the more she loves it—the more she will endure for it. The more the child frets and cries, the greater her devotion to it. There are men with mothers’ hearts, men who may admire what is strong, but are touched, and who love only what is weak.’ She shook her head again. ‘No; only in weakness can Josephine recover him. When Gabriel Gotham was rich and at his ease, I nursed my pride and my resentment; but when he was dying, with no one that loved him by, no one even to care for him, to hold his head and wipe the sweat from his brow—then I could not hold out any longer; all my pride went down like a tent when the pole gives way. I know Richard, and I see my own nature in him. He is purposeful, and will not be turned when he has set his head in one direction.’

‘At all events,’ said Mr Sellwood, ‘you will let him know what Josephine has done. Impress on him that she has made over everything to him. Whether he chooses to take it or not, all that Mr Gotham bequeathed to him is now your son’s. If he refuses to take it—it accumulates for his children. Josephine only delays to hear what I have to tell her about Richard Cable, before executing the requisite deeds. Tell your son that he must appoint some one as his agent, to look after the estate, and care-keepers to take charge of the house, for Josephine will vacate the Hall and leave Hanford.’

Mrs Cable remained thinking, with composed face and a stern look, usual with her, on her brow. ‘I will tell him the main matter,’ she said after a long consideration; ‘but all the particulars, you must tell him to-morrow. I will go to him now and prepare him. You come, sir, if you will be so good, in the morning and see him.’ She rose in her dignified manner, made an old-fashioned courtesy, and left the room.

When she had gone, the rector put his hands under his coat-tails and walked about the room. 'After having been bitten by a mad dog,' he said to himself, 'the best thing to do is to run or walk till one drops, so as to work off the poison from the veins. I'll do the same with that *Maggie* ale. I feel it in me still. I'll go out. And, by the way, I'll see if there be any toysthops in the place where I can get some twopenny trifles to amuse the little Cables to-morrow.'

On reaching the *Maggie*, Bessie Cable went directly to her son's room and discharged the obligation she had taken on herself. She told what she had to say plainly without comment, confining herself to the bare narration.

Richard listened without interrupting her. His face had acquired some of the sternness which hers had gathered during years of trouble and self-compression. It was now very stern. When she had done, he spoke in reply with a firm voice: 'Mother, I will have none of my father's possessions, because he never called me son. It is indifferent to me what She may decide, how she may dispose of them. Neither she nor his possessions concern me.'

Mrs Cable breathed freely. Her son thought in the matter of the Hanford estate like herself. She had felt convinced he would so think; but it was a satisfaction to her to hear him so express himself.

After a short pause, he went on: 'Mother, I will not stay another day here. Whilst you have been absent, I have called up Jacob Corye, and I have told him that we would all leave to-morrow.'

'It is impossible.'

'We all leave to-morrow for St Kerian. I will not stay here. The parson has followed and found us, and *She* will be coming next. I know she will. She only waits to hear that he has seen us, that she may come and see us also.'

'She is very sorry, thoroughly repentant. She sends you her humble love.'

'I refuse her love, as I refuse the Hanford estate. I will not see her again. I cannot forgive her. I will not forgive her. I should hate her as much if she came kneeling to me as if she came scoffing at me. She is false and cruel. I always thought that was a queer passage in Scripture about the unpardonable sin. I can understand it now. She has sinned the sin unto death against me, and I will never forgive her in this world or the next.' His eyes began to flame with wrath again; the mention of Josephine was like the poking of the fire in a forge—it made the glare and heat break forth in spurts and sparks.

'Richard,' said his mother, 'you cannot go to-morrow.'

'Go, I will,' he said, moving impatiently in his bed. 'I have ordered Jacob Corye to get me a wagon with trusses of straw; and I will lie on them, and the children can sit about me and in the corners. I shall go mad if I stay here, thinking every moment that I hear her hand on the door, her foot on the stair, and that next moment I should see her come into my room. If she came—lame though I be, I would leap out of the window to escape her.'

'Richard!'

'I cannot stay here. I must go to St Kerian to the house that belongs to us. That at least

will be my own home; there I can be master, and shut the door in her face, if she dares to pursue me thither. Here I am in an inn, and an inn-door is open to every one.'

'Richard,' said Bessie Cable gravely, 'are you afraid of her?'

He did not answer for a moment, but at last he said: 'I always was afraid of her, from the moment I saw her when we were cast on the sandbank.'

'No, Richard,' said Mrs Cable suddenly, 'it is not true. You are not afraid of her. You are afraid of your own self. You love her still, as much as ever; and I say—she will conquer you—yet. I cannot see into the future; God knows how. Perhaps, as your father conquered me, through weakness; but the time will come, as it came to me. She will conquer you, in spite of all you set up between you, all your turning away, all your anger and resentment; she will conquer you—yet.'

## WAR INDEMNITIES.

THE rapidity with which countries recover from the ravages of war has attracted the attention of most political economists. The phenomenon was first explained by Dr Chalmers; and since his time, explanations more or less similar to that given by him have found their way into most of the current economical text-books. A point, however, closely connected with this, and which has received less consideration than it deserves, is the great facility with which a vanquished nation has sometimes been able to pay an apparently ruinous fine which a victorious enemy has imposed upon it. By far the most striking example on record is the case of France after the war of 1870-71. The Germans, not satisfied with the annexation of Alsace and Lorraine, insisted that France should pay the cost of the campaign, as a losing litigant pays the costs of a lawsuit; and a fine amounting to the enormous sum of five milliards of francs, or two hundred million pounds sterling, was exacted, the German troops remaining in occupation of a part of the French territory until the last farthing of it was paid. One would naturally have supposed that, to a country already crushed and prostrate, this would have been a blow from which it would have taken generations to recover, and that the payment of such an indemnity would have taxed to the utmost the financial resources even of so rich a nation as France. The astonishment of Europe was therefore great when it was seen that not only was the indemnity easily and quickly paid, but that the financial condition of France was, at the end of a few years, more prosperous than that of her rival. So evident, indeed, was this, even to the Germans themselves, that it was humorously proposed by a writer in a German periodical that when Germany next beat France, the French should be compelled to receive, instead of paying, a fine of two hundred million pounds.

We have now to consider the causes of this singular phenomenon, and in doing so it is necessary to advert to the peculiar economic position in which, twenty years ago, France was placed. The bulk of the population consisted then, as now, of small proprietors, a class whose industry and thrift are proverbial, but which is not remarkable for its general education or intelligence. The

banking system of the country was in a backward state, and joint-stock Companies were far less common than in England. A French peasant proprietor, therefore, who had saved a little money beyond what he could profitably invest in the improvement of his farm, was utterly at a loss as to what he should do with it, and in his perplexity, he usually buried it in the floor, or hid it in the wall or roof, of his cottage. Thus, a large part of those funds which, in countries that have reached a higher point of economic development than France had then attained to, are deposited in banks and invested in commercial enterprises, was lying, like the buried talent in the parable, useless alike to its owner and to mankind.

It was evident that any event which should induce the millions of French proprietors to draw forth their hidden hoards and place them out at interest would be a benefit to them and, through them, to their country. The extent, however, to which the country as a whole would benefit by such an occurrence would depend upon the nature of the investment which induced the peasants to lend their money; if it were a productive undertaking, the country would gain largely; if an unproductive one, it would gain little, or not at all. But even if the undertaking were unproductive, the country would be no worse off than before, because the money spent upon it would not represent capital withdrawn from a profitable employment. The necessity of paying two hundred million pounds to clear the soil of France of the German invader was an event exactly calculated to produce the above result. An appeal was made at once to the cupidity and to the patriotism of the French peasantry. They were offered interest by the government for their hidden gold, and were told that by lending it they would help to shorten the period of German occupation. The gold came forth from its hiding-places, was lent to the French government, and was paid over by it to the Germans. The total result to France has been that the French taxpayer is now paying, and the owners of the hoarded gold are now receiving, interest upon so much of the indemnity loan as was subscribed out of these hidden hoards. One set of Frenchmen are paying interest to another set of Frenchmen; the hoarded gold has gone to Germany, and in other respects the country is in the same position as if the indemnity had never been exacted. It seems a paradoxical assertion, but it is nevertheless a true one, that not only was the payment of this gigantic fine little injury, but it was even in a certain sense a benefit to the people of France. The country was, economically, in a backward state; the various forms of credit were little known, and the peasantry were afraid to trust their money out of their own possession. They have now learnt that they can lend it safely and profitably to their own government, and this has inspired them with confidence to deposit their money in banks and to lend it to joint-stock Companies to a much greater degree than was usual before 1870.

The advantages which arise from lending and borrowing—that is, from credit—are similar to those which arise from all exchanges. A has what B wants, and B has what A wants. They exchange, and each is better off than before.

Similarly, A has one hundred pounds which he cannot himself employ profitably, but B could employ it profitably if A would lend it; A lends it, and receives interest out of the profit which the use of it enables B to make, and both are better off than before the loan was effected. Credit of this kind is the very life of commerce; and whatever encourages legitimate credit is an advantage to a nation in trade, just as an improved weapon is an advantage to it in war. 'Neither a borrower nor a lender be,' may have been excellent advice for Polonius to give Laertes when leaving Elsinore to complete his education in Paris; but a nation which acts on it as a commercial maxim will be left far behind in the race of industrial competition. France was in great danger of being so left behind, and from this danger the necessity of paying the German indemnity contributed in no small degree to deliver her. It was, in fact, a blessing which came in the guise of a disaster.

Let us now turn our attention to Germany, and consider the effect produced in that country by the influx of French gold. Part of it was used to restore the currency; part was hoarded for military purposes; but a large part was expended in constructing fortifications and on other public enterprises. So much of it as was spent in this last way flowed into the channels of circulation and caused an inflation of prices. This rise of prices was mistaken by the mercantile part of the community for a rise proceeding from other causes, and one of those speculative fevers set in which almost invariably terminate in a commercial crisis. It would be difficult, perhaps impossible, to determine whether the country lost more by reason of the crisis than it gained by the command which such a mass of gold gave it over the wealth of other nations; but this much is certain, that the blessing was a mixed one, and that just as the French lost less, so the Germans gained less, than a careless observer might have supposed.

An interesting and deeply important question—we mean, important in a speculative point of view, for we trust it will be long indeed before it becomes a practical question—will here perhaps occur to our readers: What would the effect be upon England were she called upon to pay a heavy ransom to a victorious invader? Would her vast wealth not enable her to do so with at least as little sacrifice as France incurred in 1871? We think the answer must be in the negative. The case of England is widely different from that of France. Except the reserve of the Bank of England, the country contains no metallic hoard; and that reserve, besides being very small in comparison with the sum paid by France to Germany, is not an idle or useless hoard. All the petty savings of even the poorest classes in England are collected, and either deposited in banks or invested in joint-stock Companies and Friendly Societies. Our system of credit has been elaborated to such a degree that it is now so delicate, so sensitive, and so complicated, as to form one of the greatest marvels of modern civilisation; and by means of it we are able to carry on a gigantic trade without using more of the precious metals for currency purposes than the amount required for small retail transactions. It is evident that a

country such as this, having no private hoards to fall back on, has three ways, and three only, of meeting any large external demand: it can send abroad its metallic currency; it can export the metallic reserve of the Bank of England; or it can send commodities. No other means of liquidating such a demand exists, or can be conceived; and to liquidate it in any of these three ways would be a heavy blow to the nation. To export our metallic currency would make it necessary to substitute for it an inconvertible paper currency, which would be to follow the worst financial precedents and to return to the dark days of the Bank Restriction. To export the Bank reserve would make it necessary to authorise a suspension of specie payments by the Bank of England, and would be an expedient similar in principle to an issue of government paper, and but little less mischievous in degree. The third course—that of exporting commodities equal in value to the indemnity we had to pay—would be by far the least objectionable mode in which we could meet the demand; but it is hardly necessary to point out that to hand over to an invader two hundred million pounds-worth of useful commodities is a very different thing from paying him (as France did) that same sum out of gold which was lying idle.

To what conclusion, then, do these reflections lead? We think to this one: a nation which has reached a high point of economic civilisation, in which credit is completely organised, and the use of metallic currency, except for retail transactions, almost entirely dispensed with, and in which the small savings of individuals are collected, and profitably employed, by banks and similar institutions, will always find greater difficulty in paying a war indemnity than a nation in an earlier stage of economic development, in which the savings of the thrifty poor take the form of a metallic hoard, and in which the metallic currency is very large. A nation of the former kind having no hoard of idle money to draw upon, must meet the demand out of money which is serving some useful purpose, or else by exporting commodities; and the national capital must suffer a *pro tanto* diminution. A miser from whom a highwayman takes one thousand sovereigns is not really worse off than he was; but a merchant who is robbed of the same sum has lost capital equal in value to one thousand pounds.

## A MATTER OF CONSCIENCE.

### IN THREE CHAPTERS.—CONCLUSION.

DR WYNYARD began the conversation by informing Miss Brock of his plans for her residence with his mother. She said little, but he could see that she was pleased; and rather wondered why she should be so. His vanity was not sufficient to make him suspect that the thought in the lady's mind was that the mother of a good man ought to be a good woman; and yet that idea, or something like it, was what passed through Miss Brock's brain.

'You look rather grave, Dr Wynyard; I hope nothing is the matter?'

'Nothing but a rather difficult question of conscience as regards your affairs,' said the

doctor. 'I want to consult you about it—that is, if you feel equal to talking over money matters.'

'I shall be very glad to do so; but I doubt if I can be of much help,' said the girl simply. —'Won't you sit down, Dr Wynyard?'

He did so, and proceeded to give her a concise account of her father's instructions, and his own opinions thereupon, not omitting the lawyer's remarks. Indeed, Wynyard felt that insensibly he was making the best case he could for the expediency of carrying out the will. The girl only interrupted him once or twice, and then her questions were very pertinent. When he had finished, she meditated a little, and then delivered her opinion.

'I think I quite understand now, Dr Wynyard. You must know so much better than I can. But for my own part, I have no doubt at all upon the subject.'

'Have you not?' said Wynyard hopefully. 'Then you think I may invest your money with a clear conscience?'

'O no!' said the girl. 'That was not what I meant at all. There is a verse in the Bible that seems to me to be perfectly clear on the subject. May I show it to you?'

Wynyard made a sign of assent, wondering what was coming next. Miss Brock took a Bible from the table and turned over the leaves quickly. 'Here it is!' she said, and read in her clear young voice the words of Solomon: 'It is naught, it is naught, saith the buyer: but when he is gone his way, then he boasteth.' —'Is not that exactly what we should be doing, Dr Wynyard?'

'I suppose so,' said the doctor, rather unwillingly; 'but we should not be decrying the value of the shares by buying them—rather the contrary indeed.'

'Well,' said the girl with great simplicity, 'I should have thought that the cases were the same; but of course you know best.'

'I don't think I do, at all,' said Wynyard honestly. 'It is very possible that if there were not so much money at stake, my opinion might agree with yours. But you must not make up your mind all at once like this; I want you to think it over quietly. Your income, if we do not carry out your father's plan, will be a little over three hundred pounds a year; whereas, if we *do* carry it out and succeed in selling our shares at twenty pounds each, it will be somewhere near six thousand pounds a year. Do you understand what that means?'

'I know so little of money,' answered the girl musingly. 'Even three hundred pounds a year seems a great deal. But in any case, surely, Dr Wynyard, it cannot alter the question of right and wrong?'

'Certainly not,' Wynyard acquiesced. The simple Christianity of his ward, and a lurking feeling that his own conscience agreed with her,

were too strong for him to attempt to argue the point at present. But he determined to gain time. 'Well, Miss Brock,' he said, 'will you think it over well, and let me know what decision you come to, next time I see you? I hope to be able to bring you a cordial invitation from my mother to-morrow, and then we can decide finally.'

'But what am I to think over, please?' asked the girl. 'If it be the right or wrong of the matter, I cannot see that there can be any question at all.'

'Well, would you mind talking it over with Mr Walker the lawyer?' asked Wynyard, with a keen sense of his moral cowardice in shifting the burden of argument on to the shoulders of another man.

'Not at all, if you wish it,' Miss Brock replied. And Wynyard, not daring to face the lawyer again in person, went into the parlour and wrote a note to Mr Walker asking him to call at Cullercoats; and then started himself on a tour of medical visits in the neighbourhood, with a mind decidedly dissatisfied with his morning's work, but with a much increased store of admiration for his ward. John Wynyard admired Miss Brock for having conquered him so completely by her simple clearness of conscience.

Next morning, Wynyard, as he had expected, received a letter from his mother containing a most cordial invitation for Miss Brock, and announcing the writer's intention of coming up to Tynemouth that same day for the purpose of making the girl's acquaintance and escorting her down to Kent. As Wynyard read it, he felt proud of his mother—not for the first time—and he thought with pleasure of the effect which her kindness would have on his lonely ward. He found he would require to be at the Tynemouth railway station about two o'clock to meet Mrs Wynyard, and rang for his landlady to order dinner to be ready for the traveller. But just as he pulled the bell handle, the door opened and Mr Walker entered, and flung himself into a chair. He seemed decidedly put out about something, and Wynyard guessed what was coming. 'You are a nice sort of a man, doctor,' he said, 'to send me to Cullercoats to argue with a young lady, who is without exception the greatest simpleton I have ever met; and that is saying a good deal! I thought you were foolish enough yesterday, but at least you did not quote texts of Scripture at me.'

'And she did, then?' said Wynyard, laughing.

'Whole chapters she would have given me, if I had let her! But I soon stopped that. I said, if she found fifty texts it would not affect the case in point, which was a matter of ordinary business, and not to be judged by high moral rules of right and wrong. She said, her opinion, which she only offered for what it was worth, was, that every act, however small, was to be judged by these rules. I replied that, in that

case, there was no use in my arguing the question further; and that, as she was not of age, she must leave her trustee to act as he thought best. She said: "Certainly. I am sure Dr Wynyard will do what is right."—"I am not, then, young lady," I said. And so I came away.'

'I am not sure that you did not get the worst of it, Walker,' said Wynyard.

'Nonsense!' said the lawyer.—'Now, look here, doctor. I have thought the matter over, and I am quite clear upon it. You can do as you like about your own money; but the trust money you must invest as the will directs. You have no option in the matter as a trustee.'

Here the landlady entered, and the lawyer fumed in silence whilst Wynyard was giving her his orders. When she left the room, the doctor turned to him, with a grave face now, and spoke: 'If I must invest the trust money in the St Vrain's mine, at least there is nothing in the will preventing me from writing to the directors before, instead of after.'

The lawyer, for once in his life, was really startled. 'You don't mean it? You wouldn't be such a fool? Don't you realise what that would mean? You would simply make a present of a few hundreds of thousands to the directors and their friends; and probably get about three per cent. interest for your ward out of her shares, at the price at which you would be obliged to buy in. If you do such a thing, you are perfectly mad.'

'I think I shall, for all that,' said Wynyard quietly. 'I agree with Miss Brock. I think Captain Brock's idea is scarcely honest, and certainly not what a Christian man should carry out. I shall see Miss Brock to-day; and if she be still of the same mind, I will write to the directors this evening to put myself out of the reach of temptation.'

The lawyer looked at him for a moment and then took up his hat. 'Good-morning, then, Dr Wynyard,' he said grimly. 'You will regret not taking my advice, or I am much mistaken. Under the circumstances, I suppose you have no objection to my availing myself of the opportunity which you are throwing away? I must be content to be thought a dishonest man by you and Miss Brock, but I do not think that will disturb my digestion.'

'Of course you must do as you wish,' said Wynyard, rather sadly. 'But, Walker, do not let me lose my friend as well as my prospects. You do not know how hard it has been for me to give up such a chance as I shall never have again.'

'If I were sure that you were in your right senses, I might be angry,' said the lawyer. 'As it is, I still hope that you may think better of it. Meanwhile, with your permission, I will hurry off to secure my own shares and make myself safe in either case.'

Wynyard watched him as he crossed the street, with a decided feeling in his own mind that Christianity was a hard creed to live up to in the nineteenth century. But he was a man who, having once made his decision, was not easily shaken; and moreover, to tell the whole truth, the commendation for which he looked

from Miss Brock was a strong factor in the case. Still, he gave a long sigh as he closed the door and returned to the half-furnished room which was now likely to be his home for many years to come.

Mrs Wynyard's train arrived in good time; and after dinner, mother and son walked out together to Cullercoats. Miss Brock was there to meet them; and Mrs Wynyard's keen eyes noticed that the girl cast a quick inquiring look upon the doctor before she greeted her lady visitor. The preliminaries were readily arranged, the ladies having thoroughly congenial natures, and each being only anxious to save the other trouble. Mrs Wynyard was obliged to return home the next day, and Miss Brock was sure she could easily be ready in time to accompany her. When all was settled, Wynyard begged a few minutes' private conversation with his ward on matters of business; and his mother discreetly withdrew, wondering meanwhile what the nature of the urgent business could be that required her absence.

'Are you still of the same mind as regards those shares, Miss Brock?' asked Wynyard, when they found themselves alone.

'I am indeed,' the girl answered. 'But as neither you nor Mr Walker agrees with me, perhaps I may be wrong.'

'I do agree with you thoroughly,' said the doctor. 'I was not sure about it yesterday; but you have convinced me. Still, as it is a great temptation to both of us, had I not better write a letter to the directors at once, and put it out of our power to alter the decision we have come to?'

'Oh, please do!' said the girl, clasping her hands. 'It has haunted me ever since you spoke of it—I was so afraid that you would not see things as I did. And last night, I had such a terrible dream! I thought we had bought the shares, and that I was a rich woman, sitting in a grand drawing-room in a house of my own; and suddenly the door opened, and a long procession filed in of men, women, and children, dressed in rags, and looking so thin and wretched; and something seemed to tell me that all these people would have been living in comfort now, had I not bought their shares and deprived them of their rights. They all stood there and looked at me, and I felt that if they spoke I should die. So I suppose I woke with the fright; and I dared not go to sleep again.'

'It was a remarkable dream,' said Wynyard, smiling to himself at the idea of what Mr Walker's contempt would have been for it, had it been told him. 'I have brought the papers with me; so, if you will let me use your desk, I will draw up my letter forthwith, and you shall post it yourself, if you like.'

'I think I will, if I may,' said the girl. 'It is so nice to feel, once a letter is in the post, that it must go, and that you cannot stop it.—Here is a pen and ink. May I go and tell your mother about it while you write?'

'Certainly,' said Wynyard. 'There can be no secret about it now.'

As he was writing the last words of the important letter, his mother came in alone and kissed him softly on the forehead. 'I have heard all about it, John,' she said. 'Of course you were

quite right, both of you. She is a noble girl, John; when am I to have her for a daughter-in-law?'

The doctor looked up in his mother's face and, seeing a twinkle in her eyes, blushed guiltily. He made no answer, however, but continued his writing. When the letter was finished and the envelope sealed, Miss Brock was again in the room with her walking things on; and the three went out together, and dropped it in the slit of the letter-box of the first pillar they came to.

'There is an end of two hundred thousand pounds,' said Wynyard, somewhat dolefully.

'And the beginning of a new life,' whispered his mother in his ear.

A hot July afternoon, and two lovers sitting under the shade of a convenient walnut tree in an old walled garden in Kent.

'Show me your watch, John,' the girl is saying.

'This is about the twentieth time you have seen it, Mary.'

'Well, I love looking at it and at the inscription; and I am going to read the latter aloud now, to punish you: "From the Directors and Shareholders of the St Vrain's Mining Company (Limited), as a mark of their appreciation of the honourable and disinterested conduct of John Wynyard, Esq. M.D."—You must feel proud of that; I know I do.'

'Indeed, I do not feel proud,' said Wynyard musingly.—'only humiliated that my Christianity was so weak that I ever had any doubt as to what I should do. You never had, dear.'

'It was so much easier for me, John. I never felt the need of money in my life, and three hundred pounds a year seemed absolute riches to me.'

'It will be nearer one thousand pounds a year than three hundred pounds, I hope,' said the doctor. 'Even at the high rate at which I had to buy in, those shares are paying well. Mr Walker the lawyer has made a fortune and retired from business. What fools he must think us, Mary.'

'Never mind what he thinks,' said the girl quickly. 'I do not envy him his money—not in the least. We shall have plenty to live upon, and you will be able to take a London practice now; will you not?'

'I might,' said the doctor.—'And yet, do you know it still goes very hard with my pride to think it will be with my wife's money, and not my own, that I must purchase it?'

'What does it matter, if you love me, John?' asked Mary simply.

'You are too much for me, as usual,' he replied, smiling. 'If you give yourself to me and I accept you, I suppose I need not mind taking your money too. But people will talk, you know. A poor guardian who marries a rich ward cannot expect to find much quarter.'

'I am not your ward now, at all events,' said Mary playfully. 'I am lawfully of age, and have a right to dispose of myself and my property just as I think fit; and what is more, I shall expect you to obey me.'

'I did that before, if you remember,' said Wynyard.

'And never regretted it?' she asked, looking up in his face with an expression of perfect confidence as to what his response would be.

'Never!' he answered.

### MEN OF ONE IDEA.

POE has observed that every man has a pet word or phrase which he uses frequently (the 'impalpable inane' of Carlyle and the 'lucidity' of Matthew Arnold are instances in point); and it is almost equally certain that every man has a pet idea. In some, it is difficult to discover what that one idea is; in others, it is very prominent. The desire to master one's trade or profession is, we need hardly say, very laudable; but when a man has no thoughts for anything else, and cannot open his mouth without talking 'shop,' he is simply an intolerable bore. Lord Beaconsfield, indeed, defines the true bore as 'that man who thinks the world is only interested in one subject, because he can only comprehend one.'

Most notable men are handed down to posterity by their one idea; but there are many exceptions to this rule. We are told of a celebrated comedian who, by some strange infatuation, thought himself destined to excel in tragedy, and was much mortified when on benefit nights he played Romeo and the audience insisted on receiving it as a burlesque. The one idea of Charles Reade is well known. He was not content with his fame as a novelist, but wanted to become famous as a dramatist also; and there are a few living authors who are quite as ambitious.

Probably one of the most remarkable men of one idea was Lord Palmerston, who could think of little else but foreign politics. An amusing story is told of him in the *Greville Memoirs*. 'The Queen,' says Greville, 'told Clarendon an anecdote of Palmerston, showing how exclusively absorbed he is with foreign politics. Her Majesty had been much interested in and alarmed at the strikes and troubles in the north, and asked Palmerston for details about them, when she found that he knew nothing at all. One morning, after previous inquiries, she said to him: "Pray, Lord Palmerston, have you any news?" To which he replied: "No, madam; I have heard nothing; but it seems certain the Turks have crossed the Danube." The fact that Palmerston at this time was not Foreign Minister, but Home Secretary, adds point to the anecdote.

Some of our judges are men of one idea. A short time ago, a learned judge had never heard the name of one of the most popular actors of the day; and another asked, 'What is baccarat?' which had been mentioned in the course of a case heard before him. At length, however, there are signs that their lordships are becoming conscious of what is going on in the world, and that they occasionally glance through a newspaper. When one of the counsel in a recent case called Mr J. L. Toole, and said, 'You are known as Mr J. L. Toole, the lessee of Toole's Theatre,' the Lord Chief-justice triumphantly exclaimed: 'We all know that.' This is certainly a hopeful sign.

There are certain well-known types of men of one idea—such as the 'horsey' man. Many of

them are not quite so bad as Smedley's well-known character, who assured his 'dear Fanny' that

There are moments  
When love gets you in a fix,  
Takes the bit in his jaws, and, without any pause,  
Bolts away with you like bricks.

But, as a rule, their talk is of the turf, turf. Sydney Smith's son, who was known as 'Smith the Assassin,' was, according to Mr Serjeant Ballantine, a man of this class. Late on in life, he entertained gloomy thoughts of the future. 'On one occasion,' Mr Ballantine says, 'when he was about to meet the Bishop of London at dinner, his reverend father suggested to him the propriety of exhibiting to that distinguished prelate his familiarity with the Scriptures. Accordingly, he seized upon the earliest opportunity to ask his lordship "whether anything was known of the condition Nebuchadnezzar was in when he came up from grass."'

With the men who are apt to look at everything from a pecuniary standpoint and whose whole aim in life is to amass money, we are all familiar. As the worship of mammon has been condemned by writers and divines of all ages, and as this phase of our subject is decidedly hackneyed, we shall content ourselves with relating a story of one of these men of one idea. General Skobeleff, according to the story, was working one evening in his tent near the Danube, or near a pond, when a Turkish bomb dropped at the threshold of his tent. The general had just time to see the sentry outside stoop down and throw the shell into the water. Skobeleff approached the soldier and said: 'Do you know you have saved my life?' 'I have done my best, general,' was the reply.—'Very well. Which would you rather have, the St George's Cross or one hundred roubles?' The sentinel hesitated a moment, and then said: 'What is the value of the St George's Cross, my general?'—'What do you mean? The cross itself is of no value; it may be worth five roubles perhaps; but it is an honour to possess it.' 'Well, my general,' said the soldier, 'if it is like that, give me ninety-five roubles and the Cross of St George!' The sentry, it should be noted, was a Jew, with a fine Semitic profile.

Another class of men of one idea are those who have little or no knowledge of modern literature, and who think that all the 'wit and wisdom of the world are concentrated in some fifty antique volumes.' Take an illustration from an anecdote told regarding Thackeray. Before the great novelist could deliver his lecture on English Humorists at Oxford, it was necessary to obtain the license of the authorities. The deputy-chancellor at Oxford, upon whom Thackeray waited, knew nothing about such trifles as *Vanity Fair*. 'Pray, what can I do to serve you?' said this bland functionary.

'My name is Thackeray.'

'So I see by this card.'

'I seek permission to lecture within the precincts.'

'Ah! You are a lecturer. What subjects do you undertake—religious or political?'

'Neither. I am a literary man.'

'Have you written anything?'

'Yes; I am the author of *Vanity Fair*.'

'I presume, a Dissenter. Has that anything to do with John Bunyan's book?'

'Not exactly. I have also written *Pendennis*.'

'Never heard of those works; but do not doubt they are proper books.'

'I have also contributed to *Punch*.'

'*Punch*? I have heard of that. Is it not a ribald publication?'

There are many other classes of men of one idea, to enumerate the whole of which is no part of our intention. A person does not need a wide circle of acquaintances to know at least one man who is absorbed in but one subject. When two men of one idea are thrown together—in a railway carriage, for instance—and both endeavour to ride their favourite hobby, the result is amusing—to a third party. The men themselves may, however, be anything but amused, and may part with scarcely a flattering idea of each other's abilities.

## THE DEVIL'S SCRAUGH.

BY AN ARTILLERY OFFICER.

I.

IN the year 187—I was quartered at Athlone, in the County Westmeath, Ireland. It is not a bad military station—for an Irish one—especially for a man who cares for outdoor sports. There are good fishing and boating on Lough Ree; and by the kindness of the landowners of the neighbourhood, many a day's good shooting of a miscellaneous kind may be had over the interminable bogs that lie all around. I enjoyed myself greatly, having a taste for solitary shooting excursions, and liking that uncertainty as to what bird or quadruped would next rise from the heather, which is chiefly to be found in Irish sport. Generally, I started on such expeditions alone, save for the company of a smart young gossoon of the town, Peter Farrell by name, who, having been born with the national love of shooting and fishing, was only too glad to accompany me for a nominal consideration, and make himself useful in pointing out the 'mearnes' which divided the properties of different owners, sometimes consisting in a narrow trench running for miles through a bog, and sometimes of an imaginary line, which I had to accept in faith, not being able to see a trace of it for myself. He also carried my game-bag, and would think nothing of a twelve-mile tramp over spongy bog-land with a couple of hares over his shoulder and a full bag at his side.

One November afternoon we had gone farther abroad than usual, and reached a bog on which I had never been before. Peter declared he knew it well; but I rather doubted the statement. We had had a very fair day's sport, and it was getting time to think of returning home, as the short winter daylight was drawing to a close. I had an idea that a short-cut might be made to reach the high-road by holding a due north-west course; but Peter inclined to a south-westerly one. The argument ran high, when at length we discerned a cottage with a thatched roof at the bottom of a hollow where the high bog-land sloped downwards to the banks of a stream.

I sent Peter down to the cottage to inquire the way, and meanwhile directed my steps towards

a little pool of water, some hundred yards in diameter, which I perceived at a few furlongs off, and on which I hoped to surprise a stray teal or wild-duck. Sure enough, there was a flock of the former birds feeding in fancied security near the edge. I selected a stunted thorn-bush growing on the margin as a good shelter behind which to approach them unperceived, and began stealthily advancing under its cover. The pond was surrounded by a large patch of light-green moss; and as soon as I stepped upon it, I became aware that it was what is called, in Irish parlance, a 'shaking scraugh;' that is to say, the water was here covered only by a floating mass of weeds and peat-moss, closely interlaced, and forming a curious combination, that was neither bog nor yet terra firma. As you walk upon such a place, it sinks beneath you, and you see a wave running along before you just as when you shake a carpet. However, there is generally little danger of breaking through, so closely matted together are the fibres, and I advanced with caution, bent on having my shot. Suddenly, without the least warning, my foot went through, and in an instant I was up to my neck in the black, peaty water beneath, just keeping my head above the surface by the bearing my outspread arms had on the moss. It was a terrible situation! If once I sank, no power on earth could save me—it would be like drowning under ice, only that, ice being transparent, there would be some hope of being cut out in that case; and here, under the mossy blanket, absolutely none. I shouted at the top of my voice for help, but with a painful conviction that if it did not come within three minutes, it would be too late, as I felt myself slowly sinking.

Suddenly I felt something thrust through the collar of my coat from behind, and heard a man's voice saying coolly: 'I have a good hold on ye with the graip now, your honour; if you make a good offer at it, you can scramble out!'

Most comforting were the words, in my desperate case. I made a violent struggle, vigorously assisted by my unknown friend with his 'graip' (a sort of three-pronged drag, which he had inserted under my collar). The cloth held; and I scrambled on to my knees, and in that ignominious position, with my clothes streaming with the black water, reached the comparatively firm ground of the bog.

'Musha, then, your honour is badly off for sport, when you must look for it in the Devil's Scraugh!' said my preserver, as I turned to look him in the face.

He was a strong, burly, Irish peasant, clad in the costume that is now rapidly becoming extinct—a chimney-pot hat, a frieze coat, knee-breeches, and gray worsted stockings. His features were striking, I thought—bushy black eyebrows meeting each other over the nose; gray keen eyes; a mouth that seemed like a straight line drawn across the face, so tightly were the lips compressed; and a square chin, with a week's growth of bristly black beard upon it. Altogether, not the sort of man you would care to have for an enemy.

'I am really very grateful to you,' said I. 'If you had not pulled me out when you did, I could not possibly have kept my head above water five minutes longer. It seems like a special

providence that you should have been there with your griap.'

My preserver scowled, and his face became less inviting than ever. 'I saw your gossoon going down the hill to the cottage beyond,' he said. 'I suppose it was to ask the way. There's no one lives there but myself, so he won't get much by his walk. If you want to get back to Athlone, just cross over the bog there where you see the tree growing its lone, and you'll strike the road.—No!'—as he saw me drawing my purse from my saturated pocket—'Turlough O'Brien wants money from no man; God forbid! When you see a shaking scraugh again, maybe you won't be so ready to venture on it!' Whereat he gave a ghastly sort of chuckle and walked off, with his griap over his shoulder, just as Peter came up. The action surprised me, as the Irish have their full share of curiosity, and rarely resist the opportunity of asking questions when they get a chance. Peter's face of dismay when he saw my wet clothes, the lake, and my new acquaintance, was a study. I wanted to look for my gun, which I had lost in my immersion; but he drew me away in great haste.

'See now, sir—never mind the gun. It's gone for ever and ever; and it's well you're not gone with it. Murther'n Irish! did ever any one see the like! And sorra a bit of me knows if we'll get home to-night at all at all, after this!'

'I've just found out where the road is,' said I. 'It is exactly where I told you—over the bog there.'

'The road, is it?' said Peter. 'Ah, then, if that were all, sorra much matter it would be. But we must only make the best of it, now we're here; and may the Holy Virgin have a care of us and be betune us and evil!' And devoutly crossing himself, he drew me away.

Needless to say that, on the way home, I demanded an explanation of him; and after a great deal of cross-examination, drew from him as curious a story as I had ever heard, and which I here give, divested of the many digressions from the point, and the rich vocabulary of Irish phrases with which it was told me.

John O'Brien, the original owner of the cottage we had seen, had two sons, Patrick and Turlough. No one knew whence he himself had come, or on what terms he had purchased the land on which he built his modest dwelling; but he appears to have been shunned by the people of the neighbourhood, chiefly on account of his living in such close proximity to the Devil's Scraugh, a place of which many wild legends had been told, and which was the favourite spot chosen by the priests wherein to confine, 'between the froth and the water,' evil spirits exorcised by them. Probably, with the exceptions of John O'Brien and his sons, there was not a man in the county who would have ventured near Lough Gallagh, as the pool was called, after dusk; and the temerity of the owners of the farm was universally ascribed to familiarity and friendship with the powers of evil.

To add to the bad reputation of the locality, a young girl, betrayed and deserted by her lover, had drowned herself in the Lough some years before the time of which I write; and the lover himself, having with tardy repentance joined eagerly in the efforts made for the recovery of the

body, was himself drowned also in the same spot, and in the presence of many of his neighbours, who were unable to rescue him, and who only succeeded in recovering the two corpses several days afterwards. There was a 'wise woman' living in a little cabin on the outskirts of Athlone, who, when she heard of the occurrence, mumbled something in Irish, and then informed her awestruck listeners that she had had a revelation, and had learned that the pool was under a spell, and would infallibly cause the death of the enemy of any one who had the courage to drown himself therein, repeating the name of the man he would doom as the black water silenced his lips for ever.

O'Brien and his sons were more shunned than ever after the event just related; but when the old man died and it was found that he had left the whole of his small possessions to his eldest son Patrick, and that Turlough was quite unprovided for, popular opinion veered round, and set in strongly in favour of the younger brother, all the dislike due to him being added to the share of Patrick. From what Peter told me of the latter man, I do not think he deserved the opprobrium which fell upon him; he seems to have been kind enough to Turlough, giving him a share of his house and of the proceeds of the land; though declining, perhaps wisely enough, to make them over to him by legal document. Turlough said little, lived in apparent friendship with his brother, and bided his time. It came earlier than he expected.

Patrick, like most of the Westmeath men at that date, was a thorough Fenian at heart, and managed to get greatly involved in the plots which led to that most abortive attempt at a rebellion, in which the government appears to have known quite as much as the conspirators themselves of the secret councils of the latter. As a natural consequence, Patrick was 'wanted,' and equally, as a matter of course, he was not to be found by the police who invaded his domicile. No one was there but Turlough, who was politeness itself, gave them a glass of whisky all round, and showed them with some pride a deed of gift from Patrick, which, in due legal form, made over to his brother Turlough the former's interest in the farm. Clearly, nothing was to be done, and the disappointed police had nothing for it but to return to barracks.

In what part of Ireland, Patrick lay hidden during the years that followed, Peter could not tell me; but it was on a spring day in 1870 that he came again, attended by certain friends of his as witnesses, to claim back the deed of gift from his brother. The seven days' wonder had passed, Ireland was quieter than usual, and there was no more talk of prosecuting ex-Fenians. The farm had only been made over to Turlough that he might manage it till better times came, and that there might be no danger of confiscation. What could be simpler than that the rightful owner should now reclaim possession. But he had reckoned without his brother. Turlough sat unmoved by the storm of passionate invective that was poured upon him, and stolidly reiterated his assertion that he had given Patrick full value for the farm, and had no intention whatever of giving it up. Words ran high, and doubtless blows would have followed, had not

Turlough at last produced an American revolver from his pocket, and threatened to shoot every man in the house—*his* house, if they did not at once leave it. Against such a practical argument there was nothing to be urged; and the men left the hut, carrying with them the frantic Patrick, mad with rage, and fired with a true Irish thirst for revenge.

Their road home lay by Lough Galliaigh. As they neared it, Patrick broke away from his friends, rushed across the quaking Devil's Scraugh, and plunged into the peaty water with a scream of his brother's name mingled with a ban! The party he had left stood still a moment in horror, and then hurried cautiously towards the margin of the pool. But the desperate man never rose again. Some thought that he must actually have swum under water till he was beneath the scraugh, so as to render rescue impossible and make sure of the anathema!

From that time forth no living man, could he avoid it, would approach Lough Galliaigh or speak a word to Turlough O'Brien. The latter was cut off from all human companionship, and driven to subsist on the potatoes he grew on his farm and the milk of a cow which he kept there. Whether his terrible penance did him good or not, Peter could not say, but I hoped it had done so. A man whose heart was wholly bad would have left me to perish in the scraugh.

No one had dared to attempt the finding of the corpse of Patrick O'Brien; but, almost daily for years past, Turlough had been seen working with his grasp here and there along the margin of the Lough and in the Devil's Scraugh itself, so the probability was that he was endeavouring to find his brother's body—whether with a hope of avoiding the ban pronounced on the pool, or with the better object of giving Christian burial to the remains of his victim, no one could say, though, of course, the peasantry inclined to the former belief. No doubt I had met with my accident in one of the holes he had dug in the scraugh, which had had time to cover itself with a treacherous layer of weed. The popular opinion was that Turlough himself would some day be drowned in such a hole, and thus fulfil the weird of the 'wise woman.'

We reached Athlone that evening long after dark, but in safety, to Peter's great surprise and self-congratulation. He had been thoroughly frightened by finding himself in proximity to the dreaded spot, and for some time afterwards boasted less than usual of his knowledge of 'every hole and corner in the bogs from Moate to Athlone.'

## II.

I am an Irishman by birth and education, and have heard many weird stories in my native land, but seldom one which impressed me so much as that which Peter had told me. It kept my mind busy and my body wakeful that night till far into the small-hours. I did not know which to pity the most—the desperate man hurrying into the presence of his Maker with anathemas on his lips and a purpose of vengeance in his heart, or the living one who 'dread his weird,' solitary amongst his fellows, unhelped and unpitied by them. Ere morning, I had resolved that, so far as I was concerned, the matter should not rest

there, but that I would at once pay Turlough O'Brien a visit, express my gratitude to him better than I had been able to do it in the hurry of the moment, and try to help him, at least by sympathy, if in no other way. He had refused to accept money; but he could scarcely decline a few articles, of use to a man in his circumstances, if brought to him as a present and not as a reward, and these might be my excuse for intruding upon him. Truth to tell, I was rather doubtful as to the reception I might meet with at the farm.

'Man proposes, and God disposes.' It is a trite saying, but a practical one. When I rose in the morning, I saw the sky covered from zenith to horizon by a leaden pall of cloud, whence descended an unbroken torrent of rain, turning the streets to rivers of mud, and splashing on the pavement from every gutter, as if the deluge were come again. Bog-trotting was, in such weather, out of the question, and I resigned myself to the inevitable, though reluctantly, as I knew well that when steady rain begins in the County Westmeath in November with a falling barometer, no man can say when it will stop. But I was scarcely prepared for the rainfall of that November. Ten whole days did it continue without a symptom of cessation; then came a break of sunshine late one afternoon, a fine night, and again rain in the morning. When, on the fourteenth day, the mercury in the barometer that hung in the anteroom showed signs of rising steadily, in place of jumping up and down every few hours, and the clouds thinned away and let a watery glimpse of sun come through, we were all thoroughly tired of inaction and indoor confinement, and half the country was under water.

Next morning was a glorious one, with a cloudless sky; and I started on my expedition—alone this time, as I did not think it fair to ask Peter to accompany me, knowing his feelings on the subject of my destination. I found locomotion very difficult, as the bogs were ankle-deep in water in some places, and once I thought seriously of turning back; but my good intentions were too strong for me, and I struggled on. About noon I passed the 'lone tree' and came in sight of Lough Galliaigh. It had become a respectable sheet of water by this time. The Devil's Scraugh was quite covered, and evidently my friend Turlough's engineering operations must have been suspended for some time past by the laws of nature. The cottage still stood where I last saw it, and a thin wreath of smoke rose from the chimney, proving that the owner was at home. The stream below it had become a swollen river, moving sluggishly onward close to the walls of the hut, having evidently flooded the potato-garden and fields adjoining. I was pleased to think that I had brought a few luxuries with me, a pound or so of tobacco and so on; for evidently the outcast had need of something to keep his spirits up, in view of the desolation around him.

Having thus reflected, I looked again towards the gloomy pool where I had so nearly lost my life. Curiously enough, it seemed larger than when I had viewed it a few minutes before. As I tried to account in my own mind for this phenomenon, I felt a trembling of the ground

beneath my feet; and, with a dull sullen roar, the whole bog, from Lough Galliagh downwards, split away, opening a vast chasm, filled with black foaming water, and slid away bodily towards the stream below. A few yards it thus moved unbroken, and then split in every direction into a maze of islands, all borne downwards by a resistless rush of water, that had accumulated twenty feet beneath the bog upon the impervious marl subsoil, and now bore away its load triumphantly, in a roaring torrent, directed straight upon the cottage by the stream.

At the first dull roar, I had seen—I seemed to see everything at once—the door of the hut open, and a man standing on the threshold looking towards Lough Galliagh. Then the flood broke; and cottage and man vanished like a dream in the stream beyond, followed by the great masses of peat, which choked up the bed of the channel, and piled themselves on the further bank like chaos come again. I am not ashamed to say that I turned and ran for my life. There was no saying whether my part of the bog would not follow the other. However, the release of the water had saved the remainder of the peat; and I was able, by making a long detour, to avoid that chasm where once was Lough Galliagh, and to strike the bed of the stream about a mile farther down, where already a crowd of country-people had collected, and were gazing in bewildered astonishment at the devastation around them. One or two of the most practical—or perhaps most apathetic—amongst them were groping in the rapidly diminishing waters of the stream, and fishing out relics of the furniture of the cottage, which had been struck by the first force of the released waters and carried down the stream in fragments, before the mass of peat had dammed the channel.

‘Hurroo, Johnnie!’ shouted one stalwart fellow, holding on to a long pole with a salmon gaff at the end of it. ‘I have a houl of something weighty this time. Lend me a hand, and we’ll have it out.’

I knew instinctively what was coming, and shrank from the sight. The women screamed and the men crossed themselves as the body of Turlough O’Brien was raised from the water and drawn towards the bank. His stern face with its black hair looked set and ghastly in death; and it had a great gash across the forehead, caused no doubt by some timber of the hut striking it in the water. There seemed some difficulty in getting the corpse out of the water, and it soon appeared that the right hand held a death-grip of something which looked like a bit of smoke-browned rafter. The salmon gaff was again used, and the men raised the body and its prize together.

‘God be betune us and all evil!’ shrieked an old woman. ‘Sure, it’s his own brother he has a houl of! Throw him in again, boys, or bad luck will follow yez!’

‘Nonsense,’ said I hastily, seeing an evident disposition on the part of the men to comply with the injunction. ‘Surely that thing can’t be a body!’

It was one, however, shrivelled and dried up like a mummy, but nevertheless preserved by the strange antiseptic power of the peat, so that the features were perfectly recognisable. A man in

the crowd identified it at once as what remained of Patrick O’Brien. Clearly, it had been carried out of its resting-place by the descending water.

As a suicide, the priest refused to bury Patrick O’Brien in consecrated ground; and the public opinion against Turlough was so strong that they did not dare to lay him in the graveyard. After the inquest, the bodies were claimed by some man in the neighbourhood, who declared himself—falsely, I believe—to be a relative of the deceased. No one cared to dispute his claim, or ask what he did with them; but I have reason to think that the country-people buried them somewhere near the old site of Lough Galliagh, by advice of the ‘wise woman,’ who declared that such was the only way to remove the ban that hung over the place.

#### ONLY A LITTLE CROSS.

ALL cold and lone, on the ground we found him.

The brave young spirit had passed away;

And as we folded his cloak around him,

We thought how nobly he fought that day.

Bright drops of dew on the curls were gleaming

That lay caressing the boyish brow.

Ah! that pale young face in the moonlight beaming

Is ever rising before me now.

A broken sword near his hand was lying—

His mother’s picture—a lock of hair;

And to his heart he had clasped, while dying,

The little cross that she used to wear.

That bright young head on the ground reposing,

The white face turned to the star-lit skies,

How still it lay, while strange hands were closing

The heavy lids o’er the once bright eyes.

’Twas then we thought how that light foot never

Again should beat on the cottage floor;

The joyous laughter was hushed for ever,

That gaily rang through the open door.

’Twas then we pictured his mother kneeling,

To kiss the pillow his cheek had prest;

From happy comrades, a pale girl stealing,

To sing the songs that *he* loved the best.

We thought how they who with smiles did greet him,

Could find none dearer to take his place;

The noisy children that ran to meet him,

Would watch in vain for his pleasant face;

The father’s eyes would grow dim, while telling

The daring deeds of his gallant boy;

And gloom would fall on that little dwelling,

Whose walls once echoed with sounds of joy.

The little cross from his cold hand taking,

One parting look on his face, and then,

With trembling fingers, and hearts high breaking,

We laid it down on his breast again;

And with a prayer for the thousand mothers

Who nightly watch till the shadows flee,

We left him there, for we knew that others

Would need our help, oh, far more than he!

FANNY FORRESTER.

## THE ART OF LISTENING.

It was pointed out a short time ago, by a writer well qualified to judge of his subject, that the Art of Conversation is gradually dying out in England. We write a great deal more than our fathers did; but we say less. A falling-off is visible both in the quantity and the quality of our conversation. It is obvious that by conversation the writer does not mean the exchange of observations which is carried on with sufficient liveliness wherever men and women gather together for what they describe as social intercourse. Of this species of talk there is no dearth; and if there were, we should hardly consider it cause for serious regret. But our author complains that the conversation which used to be cultivated, and rightly, as one of the fine arts, has been of late years persistently neglected, until society has lost one of its greatest charms.

Be this as it may, let us ask our readers to turn their particular attention to a kindred subject of equal importance—we mean the Art of Listening. Much as we may deplore the loss of good talkers, it would be far more disastrous were the race of good listeners to be allowed to die out. A good talker is one of the luxuries of life, to be brought out and enjoyed on special occasions. A good listener is essential to the every-day comfort of home. Nay, further, we have no doubt that the decrease of the former is largely due to the rarity of the latter. There are many of us who are secretly conscious we could talk well if we had any one to listen to us. We are silent for lack of an audience.

The writer knew an old French marquis who held strong opinions on this subject. His earnest and reiterated advice on the topic of matrimony was concentrated chiefly on this one point. 'Marry a handsome woman if you will, a rich one if you can,' he used to say; 'but in any case marry a woman who listens.' And this he considered the only true method of classifying the sex. Others might view them as good and bad,

clever or stupid, pretty or plain. He asserted simply that there are women who listen, and women who do not. He added that the latter were in the majority.

We trust that no one will hastily infer that we are so far behind the age as to consider that listening is the exclusive province of women. That they can talk, and talk to some purpose, has been so clearly demonstrated, that there are few who would now be bold enough to deny it. At the same time, we are sure that good listeners are more often found among women than among men. The quickness of a woman's perceptions, the warmth of her sympathies, her capacities of endurance—these are the very qualities essential to real proficiency in the art. Is there any picture more lovely, in the whole gallery of Shakspeare's women, than the portrait of the beautiful Venetian winning Othello's heart by the perfection of her listening? Some of the most popular women have neither beauty, rank, nor wealth to recommend them; we have known such owe their position in the hearts of their friends chiefly to the fact that they were the most charming of listeners. On the other hand, how many women are there whose usefulness and happiness are marred by their ignorance of this accomplishment! Let us give an illustration of our meaning.

Where could you find a sweeter, brighter, more lovable young wife than Beatrice? As Benedict sits opposite to her by the fireside after dinner and watches her graceful head bending over her book, he may well feel proud of her. 'I met Williams in the City to-day,' he says presently.

'Did you, dear?' says Beatrice, looking brightly up from her novel.

'Yes. He says he thinks that house of Parker's would be the very thing for us. There are six rooms—kitchen on ground-floor, and a good strip of garden.'

'A good strip of garden on the ground-floor,' repeats Beatrice dreamily, her eyes on the page.

'I wish you'd listen to what I'm saying,' says Benedict, somewhat crossly. 'If you'd rather read, of course'—

'But I would not rather read,' answers Beatrice, closing her book readily, and fixing her eyes on her husband with a well simulated air of profound interest. But she keeps her finger in the place, which Benedict perceives, and draws his conclusions; and presently he gets up, feeling a trifle hurt, and says he is going over to have a smoke with Jones.

Nowhere will you find a better sister than Martha. She watches over the domestic affairs of her brother Theophilus with the truest devotion. His gloves are always in their place, his coat always brushed; nor is he ever exposed to the mortification of putting on a clean shirt and finding too late that it has a button lacking. In one respect only does Martha come short of the ideal sister.

'Would you like me to read something aloud to you?' says Theophilus, coming into the room where Martha sits by the fire knitting his winter socks. 'I have just got the new number of the *Asiatic* with my article about the vowel sounds in Sanskrit in it.'

'Delightful!' cries Martha.

Thus encouraged, he begins to read, giving every word its due weight, as only authors do. Presently, he is aware of a low under-current of sound. He pauses, and catches the mystic syllables, 'Knit one, purl one, knit two together.'

'I am afraid you find it a little dry,' he suggests wistfully. Martha protests that, though she is counting her stitches, she is listening all the while and enjoying it immensely. But the reader's pleasure is gone. Martha is an admirable woman; why does she not listen?

I was asked not long ago to spend a few days in a country-house to meet the *fiancée* of the eldest son, an old college chum of mine. The young lady was pretty, intelligent, accomplished; and I heartily congratulated Tom on the marriage he was making. But when I spoke to his brother in praise of his future sister, he said gloomily: 'Wait a bit,' I waited. The first day I thought her clever. The third day I found her not clever exactly, but vivacious and amusing. By the fifth, I had grown heartily weary of the unceasing flow of her commonplace chatter. When, at the end of the week, I heard that the wedding-day was fixed, I found myself sighing involuntarily. Since their marriage, they have often pressed me to go and stay at the Rookeries; but I like occasionally to have an opportunity of making a remark myself, and for this reason I have always refused the invitation.—Poor Tom!

## RICHARD CABLE, THE LIGHTSHIPMAN.

### CHAPTER XXXVII.—THE DIVER.

'My dear Josephine,' said Mrs Sellwood, 'I can't quite follow you. Why should you not become a governess, if you really are bent on earning your livelihood? I cannot endure the thought of you taking a menial position.'

'Is not that of a governess menial?'

'Hardly so. At least, a lady can maintain her position as a governess; but when she

becomes'—she hesitated—'something else, I mean something lower, it makes all the difference in the world.'

'But, dear Mrs Sellwood, I want to step down into that inferior class, to be able to see with their eyes, hear with their ears, think with their brains, and throb with their passions.'

'It is quite unnecessary,' said Mrs Sellwood. 'I can do that. You can do it without any quixotism. With them, it is as with all satellites—they reflect the light of their sun; that is, of the social sun, the lady of the house, or the gentleman, round whom they move. The butler always assimilates himself to the manners and modes of thought and expression of his master; and the lady's-maid to those of her mistress. Of course, they never reach their glory; they are, so to speak, pitched in a lower key. They repeat their superiors in an inferior sphere. It is like the echo to the human voice. The same words repeated, but a tone or a semitone, and broken—reflected back. I have known butlers who really might have been mistaken for gentlemen, and ladies'-maids with really very pretty manners.'

Josephine shook her head meditatively. 'Don't you think, Mrs Sellwood, that the similarity may be external only? I have heard parrots speak like Christians; indeed, I have been told by my father of one which said: "No primogeniture! Down with the House of Lords! Tichborne for ever!" But it had a parrot's mind, for all that.'

'Well,' said the rector's wife, 'more than half the people in the world have parrotical minds, if I may so express myself; they merely repeat what they hear, without attaching sense to the words. It is exceptional to find a person who thinks as well as speaks. Servants are nothing but human parrots; they repeat more than the words; they repeat the ideas, prejudices, manners, even voices of their superiors, in an exaggerated and somewhat grotesque form. Why, half the words they use they do not understand; I mean those of Latin and Greek origin—perambulator, affidavit, telegraph, bicycle, and so on.'

'They understand what these words mean, but not their derivation.'

'We know both. The words convey more to our minds than to theirs. Surely, you can imagine yourself ten degrees stupider than you are, and you at once descend to the menial mind.'

Josephine was still unsatisfied. 'I do not know that,' she objected. 'I fancy we who are cultured can no more understand the mind of the uneducated, than a man can follow the thread of ideas that traverses the brain of a horse.'

'They have no threads of ideas—only threads which they pick up from us. We, who are educated, have our ideas and our reason; and we work out problems, and we throw down our thread-ends and conclusions; and the uneducated take them up and tangle them together into a ball in their brains.'

'I do not believe it, Mrs Sellwood,' said Josephine. 'Have you ever seen those mats and rugs made by cottagers out of bits of coloured cloth and list? They weave them into some kind of pattern, but the main fabric of the mat is strong hempen twine. This twine is made into loops,

and the fag-ends of coloured cloth are slipped through the loops and gripped and drawn together. These mats have wonderful wear in them, because of the strength and tenacity of the hempen substructure. I quite allow that the lower order of men have not broadcloth minds, have minds made up, as you say, of scraps of culture cast aside by their superiors; but they do weave them into some sort of pattern, and make them into serviceable textures. What I want to learn is, what is the substructure of hemp, what is the grasping, assimilating, organising faculty in the minds of the uneducated? I can never find that out without going among them.'

'You will not find it out if you do go among them; there is no such substructure as you imagine.'

'But, Mrs Sellwood, how do you know? How can you know, never having been inside the circle of the uneducated?'

'I can judge by what I see,' answered the old lady touchily. 'You are like those Australian explorers who went into the heart of the island expecting to find mountains and lakes, pastures, gold mines, and nearly perished in the infinite monotony of desert they traversed.'

'I am not going to make any discoveries; I do not anticipate finding a land flowing with milk and honey, or hope to induce colonists from the upper classes to come down and camp in it. I go because my husband belongs to that rough and stony land, and I wish to inhabit it with him, to share his privations and pleasures.'

The rector's wife said nothing. She was doing some woolwork, a group—Ruth and Boaz.

'Mrs Sellwood,' said Josephine, 'I am not sure that I shall not find an agreeable freedom from formality in the life below the line. Are we not all, who are above it, set to work our lives out like that piece of wool embroidery on which you are engaged? We have to make our stitches exactly according to pattern, and put in exactly the regulated number, and the proper tints. The result is extremely unsatisfactory when the miserable piece of work is done.—Do look at Boaz! His eyes are square; and Ruth's face in profile has a nose resembling a flight of steps. Because the social pattern set before us requires us to make square eyes and staircase noses, are we to do so servilely in defiance of all the canons of art and truth?'

'The nature of the woolwork stitch will not allow of any other arrangement. Allowance is made for the exigencies of canvas.'

'But why should we go on making steppy noses and square lustreless eyes, because the canvas and stitch require it? When you have done your Boaz and Ruth, what is it? It is not a picture—it is a caricature.'

'It is a banner-screen, and will shelter many a face from the fire, and perhaps recall me to the thoughts of my grandchildren, when I am dead and turned to dust.'

'You have run off with the illustration away from what we were discussing, and which this embroidery was meant only to illustrate.'

'I know perfectly what you mean, and I am thinking of that. Suppose our lives are formal, worked out patiently in little squares; first a stitch from right to left, and then another from left to right; now with wool of one tint, then

with wool of another—well, it makes a complete whole. There is system in it; there is forethought. It is a work of great patience and perseverance, and it will always tell that tale to generations to come. But the lives you speak of are not so systematised; they are like the needlework of one colour-blind—a jumble, with no idea in the worker's mind how to make a stitch, how to keep in line, to strain his wool, to match his shades. When, however, the untaught and undisciplined comes into service, is brought into contact with the highly civilised and educated and disciplined, then he or she begins—involuntarily, may be—to copy what is seen; just as the barbarians who invaded the Empire copied the civilisation of Rome. The menial begins at once to sort the wools and to practise stitches; and the result is a copy—sometimes a copy in ill-matched colours, and with irregular lines—of the work of the master or mistress. As far as it is a copy, it is interesting. Where it is not—it is void of everything attractive; it repels.'

'I am not convinced,' said Josephine. 'I will tell you whether I am wrong and you right, after I have made the experiment.—Mrs Sellwood, have you ever read *The Devil on Two Sticks*?'

'Good gracious, no! It is not proper for one to read.'

'There is no harm in it. Asmodeus takes the student through the air over Madrid, and removes the roofs of all the houses, so that he can see what goes on within: the story of life in every house, in every room, is revealed to him. Do you know I often think of that when I am with people? I consider what mysteries, what romances, what workings are within these little chambers, with the two eyes as windows; and I long infinitely for a devil to remove the scalp and let me see what is within. Neither you nor I, nor any member of our order, knows in the least what is going on in the great city of the commonality below us. We want to have the roofs lifted, that we may look in and see the stirring in the brains, and then only shall we understand the thoughts and prejudices, the beliefs, the doubts, and the poetry of Demos.'

'And the commonplace,' added Mrs Sellwood.

'I will tell you all, when I have seen,' exclaimed Josephine vehemently.—'Dear Mrs Sellwood, I have been brought in contact with one—the best of men—belonging to that city of mystery. He could not understand me, and I could not understand him. It was as if I belonged to the flying island Laputa, and he to the country of the Houyhnhnms.'

'My dear, you are referring to *Gulliver's Travels*.'

'Of course, Mrs Sellwood.'

'But—ladies never read further than the voyage to Lilliput.'

'I believe they are supposed to limit themselves to the infinitely little.'

Neither spoke for a few moments after this. Mrs Sellwood was offended. She, as well as her husband, allowed, and always had allowed, Josephine to speak freely before them. They knew, or suspected, that the influences at home were unsatisfactory; and they had encouraged frankness in her, that they might get to under-

stand her mind, and be able to give some direction to her thoughts, and exercise some check on her inconsiderate impulses. But in permitting this freedom, they had to endure the sharpness of her tongue, which sometimes cut the old people unpleasantly, drawn athwart old prejudices and traditional principles.

'Did you ever read Schiller's *Diver*, Mrs Sellwood?' asked Josephine.

'Yes, dear—long ago. I do not remember much about it, except that a king threw a goblet of gold into Charybdis, and sent down a page after it.'

'Exactly. And the page, when he came up, was to tell the Sicilian king what he had seen in the depths of the sea. This is what he related :

Now the purple darkness of the deep

Lay under my feet like a precipice,

And though here the ear must in deafness sleep,

The eye could look down the sheer abyss,

And see how the depths of these waters dark

Are alive with the dragon, the snake, and the shark.

I am quoting an English version of the poem, Mrs Sellwood, as I daresay my German may be inexact :

In horrible consciousness there I stayed,

One soul with feeling and thought endued,

'Mid monsters, afar from earthly aid,

Alone in that ghastly solitude !

Far, far from the sound of a human tone,

In depths which the sea-snake hath called her own.

I am the diver. I am going down into the mysterious depths where the whirlpool swirls, and where, as Schiller says, "a new sea springs from the old sea's breast." But I do not go down because I like the abyss, or think it a habitable place, or particularly desire to cultivate the acquaintance of the dogfish, dragon, and octopus, but to recover the golden chalice of my husband's esteem.'

'My dear Josephine,' answered the rector's wife, 'if I remember the story aright, the page recovered the goblet only because it lodged on a shelf above the abyss tenanted by these monsters. The king cast in the goblet a second time, and then it fell into the uttermost depth, and from thence the lad never rose.'

'It was so. And so, under water there is the shelf, and below it the vast profound. My husband does not belong to that region of horrors. His golden heart has never sunk to that. As there are stages in our flying island *Laputa*, so are there shelves below the sea.'

'Very well,' said Mrs Sellwood. 'You go down under water to the first terrace, and you will find—you yourself admit it, no monsters there—only respectables. I can tell you what you will see—because the dredge brings them up—winkles, cockles, and oysters.'

Josephine began with her sweet pure voice to sing the mermaid's song in *Oberon*. Then, for the first time since Richard had gone, she laughed, not with her old bright, ringing tones, but with a tinge of sadness, and said : 'Oh, Mrs Sellwood, I shall come up a mermaid, belonging to both realms, that above, and that below, understanding both, and at home in both. What experiences I shall have gone through !'

Mrs Sellwood threw down her work and put

her arms round Josephine, drew her to her bosom, and kissed her. 'You belong to a different order of souls from me, dear child,' she said. 'I am not heroic. I see that you have generous and true impulses, and go your own way. In that, you differ from me and such as me. I understand that, by an ingenious contrivance, locomotives are constructed for use in war-time which lay down their own rails as they go along—of course, travelling very slowly, and always running on rails of their own laying. That is like me, and persons so constituted as I am ; we always travel on rails—rails of our own laying. You are not like that ; you make furrows.'

'Yes,' said Josephine sorrowfully ; 'I tear up the road, throw about stones, and wound passers-by, and upset myself.'

'As you are bent on this experiment—of which I do not quite approve, it is so foreign to anything that I should have considered proper—I am resolved that you shall take a shelf in very shallow water. You must allow me to determine that for you. I have a sister, Miss Otterbourne, who lives near Bath, a very kind old lady, has her prejudices, as is usual with old maids—good, wholesome, well-established prejudices, that hurt no one. She has written to me for a lady's-maid. If that situation will do, take it. You will have dived, but we hold you by a hair.'

Josephine thanked Mrs Sellwood.

Then the rector came in, and with his fresh face, a waft of cool, bracing air. He squeezed Josephine's hand and kissed his wife.

'My dear Charlotte,' said he to the latter, 'we old fogies have antiquated notions, routine courses, that are unsuited to extraordinary emergencies. Josephine has been right. Her heart has told her from the beginning what was to be done.—My child, I have seen him ; I have spoken with him. I know all the circumstances. I have had my finger on his pulse. Josephine must come down to his level.'

(To be continued.)

## THE HESSIAN FLY.

AMONG the many visitors that annually with the advent of spring-time seek our shores, there has been of late years a certain group, which, though individually small in size, yet travel in so numerous a company as to bring terror to the British agriculturist. However unwilling he may be, the farmer must cater *gratis* for these voracious little insects ; and should they still continue to thrive within our shores, we may ere long find our supply of cereals even more rapidly diminished than it already is by bad seasons and over-farming. This dread guest is the so-called Hessian Fly. It comes to us not, as we might suppose by its name, from Germany, but from America. Its first appearance in Staten Island and Long Island in 1776 was contemporaneous with the arrival of some Hessian mercenaries, employed in the revolutionary war. For long it was supposed that these soldiers had brought the unwelcome guest in their straw ; hence its name. Later, however, it was discovered that the Hessian Fly was no German importation, for it was unknown in Ger-

many before 1833; whereas it had always been a well-known and much-feared visitant of the wheat-fields on the shores of the Mediterranean—in France, Spain, Minorca, Italy, and Asia Minor. More probably, therefore, the fly was introduced, not only into America, but also into Germany itself, either from Southern Europe or from Asia Minor. But whenever or however introduced into the western continent, there for a century the Hessian Fly has been busy making havoc among the various grain-crops of the country. From Long Island it has spread steadily over the different States at the rate of twenty miles a year.

As long ago as 1788, Mr Bond, the British consul at Philadelphia, wrote home to the Privy-Council of his fear that 'the introduction of American wheat into the United Kingdom might be the means of communicating the insect to other grain.' So alarmed were the Council, that they sat day after day to consider what measures should be adopted to keep the fly out of this country; and the business was considered so important, that the minutes of the Council and documents obtained from all quarters filled more than two hundred octavo pages. The Council issued an edict prohibiting the importation of corn; but after about eleven months, the order was withdrawn, the authorities having determined that the insect could not be introduced with grain. But whether in the cargoes of straw shipped by United States shippers at a loss for freight, or, as is more probable, in the straw used for packing, or with 'tail' or feed-corn, in the sweepings of granaries, storehouses, and the holds of ships, certain it is that the Hessian Fly has at last found its way into Britain. In the summer of 1886 it was first detected by Mr Palmer on his farm of Revell's Hall, near Hertford. Noticing a falling-off in his wheat and barley, and making an examination to learn the cause, the farmer discovered strange-looking objects like grains of linseed tightly packed between the outer coverings of the grain and the knots of the second joints above the roots. He at once reported the matter to Miss Ormerod, Consulting Entomologist of the Royal Agricultural Society, who, having visited the fields, declared it her belief that the grain-like objects were the pupæ of the Hessian Fly—'flax-seeds,' as the Americans call them. Patient observation of a seed which in six weeks developed into a perfect fly, and consultation with celebrated entomologists both British and American, confirmed Miss Ormerod's opinion.

Since Mr Palmer's discovery, the insect has turned up in other parts of Hertfordshire, also in Bedfordshire, Lincolnshire, Yorkshire, Cambridgeshire, Hampshire, Herefordshire, Suffolk, and other counties; and in Scotland at Crieff, Forfarshire, Fife, Inverness, and Lord Polwarth's farms at Mertoun and Bettyfield. Thanks to the promptitude of Miss Ormerod, and the energetic appeals of Mr Whitehead, the chairman of the Seeds and Plants Diseases Committee of the Royal Agricultural Society, the matter has been brought under the notice of the country at large through the medium of the newspapers, and of the House of Commons in particular. At the desire of the Agricultural Department, a Report on the Hessian Fly, con-

taining a full account of its appearance and habits, with suggestions for methods of prevention and remedies, was drawn up by Mr Whitehead, and issued to all local authorities in Great Britain. From this document we gain much interesting information about our troublesome visitor.

The Hessian Fly is a family relation of the daddy-longlegs, the common gnat, the water-gnat, and the midge, which, like itself, are included in the family *Tipulide*, of the order *Diptera*. The female fly is a creature about an eighth of an inch long. Its body is of a dark-brown colour, shading into black; its wings are of dusky gray, fringed, and rounded at the tips. It is characterised by long fringed dark-coloured antennæ with bead-like joints. The male fly, which is much less abundant than the female, is said to be smaller, but has longer antennæ. The insect seems to prefer a warm moist climate, and generally attacks plants in a poor, thin, gravelly soil, probably because these are less able to resist its encroachments. It generates twice a year—in the spring and early autumn—the first generation injuring wheat and barley plants; the second attacking young wheat-plants directly they come up. The autumnal attack is, according to Dr Fitch, the more deadly, being 'in a double sense a radical one. Each particular shoot at whose root one or more of these larvæ nestle is commonly destroyed by the time the worm has attained its growth. The presence of these worms is, therefore, readily detected by an examination of the small wheat in October or November. Individual shoots will be found here and there in the field withered and changed to a light colour, strongly contrasting with the rich green of the vigorous uninjured plants.' The effect of the insect on the plants is much like that of the disorder known as 'gout' or 'root-falling,' only that, instead of giving way at the roots and various parts of the stems, the plants attacked by the Hessian Fly are crippled and bent sharply down just above the second joint; while the stems are so weakened and 'scrawled' that there is little or no corn in the ears, and the straw is broken, discoloured, and stunted.

In the case of the spring generation, according to the same authority, the fly appears about the 1st of May, and deposits its eggs upon the same crop of grain that has already reared one brood, and also upon any spring wheat that is forward enough for its purposes, selecting the more luxuriant of the young leaves. The egg is about the fiftieth of an inch long, cylindrical, translucent, of a pale red colour, becoming in a few hours irregularly spotted with deeper red. The insect lays from eighty to one hundred eggs, placing from twenty to forty upon a single leaf in the creases of the upper parts of the blades of the young plants. The larva is hatched in from four to eight days. It is a wrinkled, yellowish maggot without legs, but with fourteen joints. When full grown, the larva is nearly an eighth of an inch long, and of a clouded white hue, with faint greenish lines. After being hatched, the larva moves from the leaf above to the second joint of the stem, at the base of the blade, and fixes itself head downwards with its head close to the soft stem, and absorbs the juices of the plant. After about five or six

weeks, according to the weather and the state of the corn-plants, the larva changes its colour to a bright chestnut, and soon after casts its brown skin. In this guise the larvæ resemble grains of linseed, and are called 'flax-seeds' in the United States.

Many precautions and remedies are suggested to prevent our country being scourged by the Hessian Fly, as the States and Canada have been. The chief of these are—late sowing; great care in the selection of seed and in the importation of grain and straw, especially from America; the enriching of the soil by strong manures; careful winnowing and sifting of refuse corn; subjection of long-strawed manure and litter to the heat of 'mixens' before use; raking or harrowing or even burning of infected stubble; pasturing the infected ground with sheep, and applying to infected fields dressings of lime, soot, or salt. When a ripe field is attacked, the only remedy is to cut the crop about a foot from the ear and burn the straw, chaff, and earings. If these precautions are not taken, the pest will spread widely; if they are adopted, the farmer will probably lose fifty shillings per acre, in addition to the ordinary and normal loss entailed by wheat-growing. Perhaps, however, the most effectual precaution would be the introduction and colonisation of certain parasites which are the natural enemies of the Hessian Fly, and soon check its terribly rapid multiplication. In this *Journal* of 25th September last year, we printed the set of directions issued on the subject by the Lords of the Committee of Council for Agriculture. As we write, a government inquiry on the ravages of the fly is about to be made, and farmers are requested to send any information on the subject to Mr Charles Wing Gray, M.P., House of Commons, Westminster.

### SINGLE-HANDED SMITH.

SINGLE-HANDED SMITH was not, as the nickname might on the face of it seem to imply, a cripple. It would, perhaps, have been better for himself and for the householding portion of society if he had been. The sobriquet was bestowed upon him from the circumstance of his having been one of the first to set the fashion of working single-handed in his profession of burglar. In the course of a long and busy professional career, he was taken only twice. His last capture occurred quite recently, and resulted in his being sentenced to ten years' penal servitude. Though a detective, I on that occasion had no finger in the pie beyond giving evidence of identity and previous conviction. His first arrest, however, was my work, and, all things considered, it was an arrest in which a detective might reasonably take a little pride.

In 1874, the burglaries in a certain suburban part of our division were unusually numerous, and in every instance the burglar—for the jobs were evidently single-handed ones—got clear away. The chief characteristic of the robberies was their boldness. On several occasions, where the attempts to break in had been frustrated, owing to their having roused the household, it was discovered in the morning that some other dwelling only three or four doors away had been

'burgled.' Apart from this seemingly reckless but practically successful daring, the execution of the jobs was inartistic and coarse, and the robberies were certainly not 'put-up' affairs. The latter point was proved to demonstration by the frequency with which the thief, whoever he was, missed come-at-able valuables that would inevitably have been secured by a burglar to whom servants or others had either wilfully or unconsciously given information. The residences performed upon were invariably such as had back gardens. Through these gardens the houses were approached, and entrance was usually obtained by the rough-and-ready method of forcing doors and windows with a 'jemmy.'

The field of labour which this particular enterprising burglar had marked for his own was within the area where I was the only plain-clothes man engaged. As a matter of routine, therefore, these burglaries were my cases; and as they went on unchecked, I naturally began to feel crest-fallen over them. I had worked very hard in the endeavour to achieve success, much harder than I had done in cases in which I was held to have scored brilliantly. Where defeat came in was in the failure to trace any of the stolen property that could be sworn to. I haunted pawnbrokers' and jewellers' shops with an energy worthy of any cause, and kept a specially sharp lookout upon the establishments of known or suspected receivers of stolen property. Twice it seemed as though my exercise of the twin virtues of patience and perseverance was about to meet with its reward; but on each occasion hope's flattering tale ended in disappointment.

So matters stood about the end of March in the year mentioned. My much-'wanted' man, though still making himself felt with undesirable frequency, was slacking off in his operations, and my hopes of being able to capture him had sunk to a very low ebb indeed. One night, or, to speak by the card, one morning, for it was nearly two o'clock, when I was out on duty, I received a message asking me to return to the station at once. On getting there, I found in the office a gentleman who had come to report that about three-quarters of an hour before there had been an attempt to break into his house. The sergeant on duty had already taken down his statement, which was to the effect that about one o'clock he had been awakened by what he described as a crashing noise on the ground-floor of his house. He had called his son, a young man of twenty, and they had gone down stairs, revolver in hand. They found that a window had been broken open, and they reached it just in time to see a man retreating over the garden fence. The garden abutted upon a railway embankment, down which he must have plunged, as they saw him ascend on the other side of the line and disappear in the fields beyond.

'Assuming that it is our old hand,' I said to the sergeant, 'there is just the possibility that he may hark back and try to do another house close by. I don't say, mind you, that he *will* have a second try this morning; still, he is just the fellow who would think it the dashing thing to do.'

The sergeant looked anything but convinced; but he only answered: 'Well, it is your job; and

if you think there is any likelihood of his falling into a trap, you had better lay it for him.'

'That is what I propose doing. Can I have a couple of men for an hour?'

'Yes; you can have the constable in reserve here, and the man from the nearest fixed point.'

Five minutes later, I set out with these two men for my proposed scene of action. The house at which the attempted burglary had taken place was one of a row of about thirty running parallel with the railway. I instructed the constables to take up their positions far enough down the railway embankment to be well out of sight, the one about half-a-dozen houses above, and the other about half-a-dozen below, the one on which our enterprising burglar had already tried his hand. I remained on duty in the roadway in front of the row of houses.

I had been pacing up and down there for about twenty minutes, when, on turning at one end of the road to go back again, I saw a man come out from the gateway of one of the houses near the other end of the row I was watching. I could make out his figure distinctly, and knew that I had the advantage of him in that he could not see me. The last house at my end of the row had its garden 'end-ways on,' and screened from the street by a wall nine feet high. At the edge of the pathway opposite this wall, half-a-dozen trees had been planted; and standing between them and the wall, as I was at the moment I caught sight of the man, I knew that I was sufficiently deep in shadow to be quite safe from observation. Keeping still, I watched the stranger approaching. He was moving briskly, though certainly not in a manner suggestive of a burglar in flight. Still, this was not a time to leave anything unnoticed, and resolving to at least have a look at this early bird, I moved forward so as to meet him in the open. He gave me a cheery good-morning, and would have passed on; but stepping in front of him so as to bring him to a stand-still, I said: 'Just half a minute.'

'I think you have made a mistake,' he said, smiling; 'or if not, you have the advantage of me.'

'I am not claiming acquaintance,' I explained; 'but I want to have a word or two with you.'

'Speak on, then,' he said, still smiling; 'but be as quick as you can about it. I have a considerable distance to go, and I am too late—or too early—to get any conveyance.'

'To come to the point at once, then. I am a plain-clothes officer, and I am on the lookout for a burglar who has been at work in this road. I am bound not to miss any possible chance of obtaining information, and I feel justified in speaking to you, as you don't live in the house you have just come out of.' This last was a random shot.

'Well, no; I don't live there,' he replied; 'but I have been to a party there, and am the last of the die-hards to turn out.'

He spoke in a perfectly natural manner; nevertheless, to my mind the answer was unsatisfactory. The houses in this road, if not exactly palatial, were large and high-rented, and the families inhabiting them were certainly 'swell' up to a point that made evening dress indispensable. And this man was not in evening

costume. His overcoat was open, and I could see that his under suit was dark tweed and of rather horsey cut, the coat buttoning high. 'That is strange,' I was beginning to say, when he broke in with: 'Then it is a case of strange but true. But why should it be strange?'

'Well, I have been walking up and down the road for the last half-hour, and I have seen no sign of a party going on.'

'Nor would you have done for the last hour, as far as that goes. For quite that time the front of the house has been "the banquet hall deserted." As I have just told you, I outstayed the others; and my friend and I were chatting in his own little den at the back of the house. And now, I'll give you my name and address, if they are any use to you.'

'They wouldn't be the least use unless they were verified.'

'Upon my word,' he cried, with a short forced laugh, 'though I am thoroughly aggravated, I can't help feeling amused. What is the crotchet you have got in your head? I begin to think you must be suspecting me of being a burglar. Now, I'll put it to yourself, do I look like a housebreaker?'

The manner rather than the matter of the question caused me to hesitate. The tone in which it was put so emphatically conveyed that, in the opinion of the speaker, such an idea was inconceivably ludicrous, that I hesitated about answering the question that had been put to me. 'I don't say you look like a burglar,' I at length replied, 'though, as far as that goes, you might look like a bishop and be a burglar. I am not detaining you on your looks, but because you have not given a satisfactory account of yourself.'

'Oh, you admit you are detaining me, then?'

'Well, yes—that is what it comes to, I suppose,' I answered.

'Then clearly understand, my fine fellow, that you do it at your own hazard.'

'Quite so. You have some good reason for declining to give a straightforward account of yourself, and I must take you into custody.'

'Will you? How are you going to do it?' and as he spoke, he stepped back, evidently intending to show fight. But before either of us could 'go for' the other, the two constables came in sight, hurrying down the road. At the sound of their advancing footsteps, my man glanced round; and the change that had come over his countenance when he turned it to me again, would have convinced me, if I had not already felt assured of it, that even if he had not been on the job I had then in hand, he had cause to fear falling into the clutches of the police. It was well I had been prepared for a rush upon his part, for it came now in a style that would have floored me if I had not been ready for it. As it was, I dodged the blow he aimed at me, and closing with him, had him fast when the constables came up, which they did at a run, when they saw what was going on. After we had secured our man, the constables told me of a house upon which they suspected he had been operating.

'All right,' I said, when I had asked the number of the house. 'You take this man to the station, and I'll follow on after I have seen the householder.'

At the house on which the burglar had made his second attempt at business, there was nothing new to be learned—there were footprints in the garden, and a pane of glass broken; and that was all.

On getting back to the station, I found that the prisoner had given the name of Smith, but had absolutely refused to give any address or offer any explanation concerning himself. This satisfied me that if I had taken an address from him, he would have given me a false one, and I congratulated myself on having stuck to him in the manner I had done. Later in the morning I put myself in a position to prove that the prisoner's statement as to having been at a party was untrue.

Such was the position of affairs when the hour arrived for going to the police court. I was still firmly persuaded that I had got hold of the burglar, though I was quite aware that the evidence on that point was weak almost to nothingness. For the moment, however, this weakness was not a fatal one, as there was ample evidence to insure a remand on the broader charge of being found loitering under suspicious circumstances and refusing to give any account of himself.

Before the magistrate, Mr Smith, as he still chose to style himself, was cool and plausible. He took the respectful and candid line. He had no questions to ask the witnesses, he said, in reply to the magistrate. Their evidence was substantially true, with the important exception, that he had not come out from the gateway, as alleged, though, as he had been walking close to the railings, and the light was uncertain, he had no doubt the mistake of the officer was a perfectly honest one.—It so fell out, he proceeded to say, that at the present time he had reasons of a private and personal, but certainly not a criminal character for desiring to keep himself unknown, and for wishing above all things not to get his name and affairs into the papers.

The magistrate expressed himself as of opinion that the circumstances leading up to the arrest constituted—while unexplained—such a case of suspicion as entitled the police to ask for time to make inquiries. He felt bound to remand the prisoner for a week, but would admit him to bail.

As might have been expected, Mr Smith replied to the effect that the reasons which prevented him from giving explanations would preclude him from seeking bail; and he was accordingly remanded in custody. It was tolerably evident, however, from the manner of the magistrate, that unless we could at the next hearing offer evidence directly connecting the prisoner with the burglaries, we would not get another remand, and it therefore behoved me to bestir myself in the interval.

At that period it was customary to photograph prisoners under remand; and on the following day I was furnished with a portrait of my man. Provided with this, I set out on my travels in search of a clue. I worked literally night and day. Once more I tried my fortune with pawnbrokers and suspected receivers of stolen property; and this time I added ironmongers' establishments to my line of exploration, in the hope that some shopkeeper in that

business might recognise the portrait as that of a man to whom they had sold tools that could have been used in housebreaking. I prowled about thieves' quarters, and scraped acquaintance with 'corner-men' and habitual criminals. I sought out firemen, street coffee-stall keepers, market gardeners, carmen, and other night-toilers. But all in vain!

At midnight preceding the day on which Smith had again to appear in court, it was still a case of 'as you were' with me, so far as concerned the possession of evidence calculated to incriminate the prisoner in respect to any specific burglary. I had come home dead-tired, and thoroughly depressed in spirit, for I could not but 'bitterly think of the morrow.' I felt as strongly as ever that Smith was the burglar; but feeling was of course of no avail, was a thing not to be even mentioned in court, and I had no doubt as to how the magistrate would act when he found there was no evidence forthcoming.

Prisoners under remand had to be brought up from the county jail by rail; and in the morning I went to the station with the van, not, however, with any definite object in view, but from mere restlessness of mood. I was on the platform when Smith got out of the railway carriage, and I fancied I saw him give a slight shake of the head to a woman who was one of about a score of spectators standing in line between the station door and that of the prison van. The movement upon his part—if it was a movement—was so slight that I could not feel certain about it; but though in doubt, I instantly resolved to watch the woman. Tearing a leaf from my pocket-book, I wrote a message to the superintendent on duty at the court, telling him that I purposed trying a last chance for getting evidence, and asking him to keep the case back as long as he conveniently could.

When the van had driven away, the woman turned her steps in another direction, and on reaching the nearest public-house, entered it. But almost immediately she emerged from it again, accompanied by a man whom I recognised as a police-court tout. He had been a solicitor's clerk, but had 'gone wrong' through drink, and now picked up a precarious livelihood by advising small-fry criminals undertaking their own defence. That the woman should be in communication with this man was, from my point of view, so far so good. He was a smart fellow, and it was doing him bare justice to take it for granted that if he caught sight of me, he would so regulate his movements as to test whether or not it was his companion I was tracking. I had therefore to follow the pair at such a distance as not only made it impossible for me to pick up any stray crumbs of the animated conversation in which they were evidently engaged, but also put me in danger of losing sight of them should they turn off short or sharp. By-and-by I saw them cross the road and enter a second public-house. Nearly opposite to this 'public' was a pawnbroker's establishment, at which I was professionally well known. For this I instantly made a dash, and hastily explaining—in a general way—to the proprietor the position I was in, I was by his 'kind permission' allowed to substitute a light-coloured, differently cut, more swish-looking overcoat for

the black one I had been wearing; to exchange my billycock for a 'top' hat, to mount a pair of eye-glasses and don a coloured necktie, and altogether to make very considerable and, as I trusted, tolerably effective alterations in my appearance. Moreover, I was permitted to watch the public-house from a storeroom window which fully commanded it.

About ten minutes after I had taken my station there, the tout and his companion came to the door, and having glanced steadily and critically up and down the road, and—apparently—compared notes, once more set forward, evidently in a relieved frame of mind. Of course I immediately followed. For a quarter of a mile farther the trail lay along the high-road, then the couple turned suddenly into a side street, into which I followed them just in time to see them enter a shop of the 'small general' order. I waited on watch a few doors off, and in about five minutes saw the man leave, and pass out at the other end of the street. When a few more minutes had elapsed without the woman coming out, I began to fear that she had given me the slip. Resolving to reconnoitre closer, I walked slowly past the shop, and looking in at the window, beheld the woman behind the counter, her hat and mantle taken off, a 'bibbed' apron on, her dress sleeves turned up, and looking every inch the shopkeeper at home. The name above the door was Henry Dunn. I did not wish to raise any suspicion in the woman's mind by entering the shop so shortly after herself. I therefore made my way to a respectable-looking public-house at the other end of the street, to try if I could there glean any intelligence of Mr Henry Dunn or the lady who was presiding over his modest business establishment. Entering the bar, I called for a glass of ale, and then, taking the portrait of Mr Smith from my pocket, showed it to the barman who had served me, asking: 'Do you happen to know who that is?'

'Well, no; I can't exactly say that I do,' he answered; 'and yet I seem to know the face.'

'Know it! Why, of course you do. Try again, old man!' exclaimed a young fellow, who, I subsequently gathered, was billiard-marker to the house, and who, with the freedom characteristic of public-house manners, had been looking over the other's shoulder and joining in the examination of the photo.

'It ain't any one as uses the house,' said the barman, though rather in a tone of question than assertion.

'Well, not regular,' said the marker; 'his regular house is the *Prince of Orange*. He's a big gun among the pothouse politicians there. But he often drops in here of a morning for a corpse-reviver.—Come, surely you know who it is now; I knew him in an instant.'

'Why, la! yes; it's Harry Dunn,' said the barman, his face brightening. "'No-confidence' Dunn, as they call him.'

'Right you are at last,' said the other.—'Eh, guv'nor?'

'Yes, that is the man,' I answered. 'But I didn't know he was called "No-confidence Dunn." How did he come by that name?'

'Oh, he fancies himself at politics; goes to public meetings, and comes out strong in the M.P. line. Questions the speakers, you know,

and bawls out, "Answer my question, sir, or I'll move a no confidence"—Are you going to put him in a paper?' he suddenly asked in conclusion.

'Less likely things have happened,' I replied in an oracular tone, and smiling to myself as I thought of the present-day possibilities of fame in association with the illustrated *Police News*.

Leaving the public-house, I took a cab to the nearest police station, and having obtained the assistance of a couple of constables, drove back to Dunn's shop. Entering with my companions, I found the same woman still behind the counter, and greeted her with: 'Good-morning, Mrs Dunn.'

'Good-morning, sir,' she answered, looking with some surprise at the constables.

'Where is Mr Dunn?' I asked.

'In the country,' she replied. 'Why?'

'He was in the country; but he was brought back this morning, as I daresay you know. You see who we are; and however surprised you may affect to be, you can guess well enough what business we are here on. I am going to search these premises.'

'Where is your'—she was beginning; but before she could get out the word warrant, I had pushed through to the little parlour adjoining the shop. Opening a cupboard in it, the first thing that met my view was a pile of small parcels, which, on being undone, were found to contain valuable property—mostly initialed or crested plate and jewelry—of a kind that could have been unhesitatingly sworn to, and that I at once knew to be the proceeds of burglaries committed in our district. Having secured these and a very neat and complete kit of burglar's tools which I discovered in an up-stairs room, I deferred—for want of time—a thorough search until a future occasion. Meanwhile, leaving the premises in charge of the constables, I arrested Mrs Dunn. She probably felt that matters had reached a stage at which silence upon her part would be golden. At any rate she accepted the situation very quietly, merely asking, as I led her to the cab, on what charge she was apprehended. I replied, that, personally, I would put the point lightly, and say unlawful possession of the property, though the probability was that my official superiors would see their way to charging her with the graver offence of receiving stolen goods well knowing them to have been stolen.

We reached the court a quarter of an hour before my case was called on, and as it was now a strong and plain case, there was sufficient time for making the arrangements for conducting it under its new aspects. When it came on for hearing, the male prisoner was brought in by himself. Leaning forward with his folded arms upon the rail of the dock, he glanced round the court, and especially at me, with a very confident air. The first intimation that he had of the arrest of his wife was when, a minute later, she was led into court. At sight of her, the blood returned to his countenance again with a rush, turning it livid, almost black indeed, with passion, as, throwing his arms above his head, he exclaimed with an imprecation: 'Rounded on—rounded on!' But that the officers guarding the dock were too quick for him, he would have felled the female prisoner as she was placed beside him

whimpering: 'O no, Harry. How can you think so of me!' His manner and action at this juncture were, to those experienced in such affairs, as good as a practical admission of guilt. From that point the case for the prosecution went smoothly and surely. I repeated in evidence what I have already told here of my morning's work and its results, and produced the stolen property found, together with the lists descriptive of portions of it that had been issued from time to time. On this, a further remand of a week was granted, to allow opportunity for bringing forward the owners of the various articles.

During the interval between the committal and the trial, I obtained some interesting particulars concerning the self-dubbed Mr Smith and his work. His escaping detection so long had been in a great measure due to the methods by which he had disposed of his plunder. He had kept altogether aloof from professional receivers of stolen property, and in fact was not known in the trade at all. Such articles as could have been unmistakably identified, he had had the self-restraint to refrain from putting on the market immediately; and though his storing them for a time ultimately furnished conclusive evidence against him, there was no doubt it had deferred the evil day. At the trial, a verdict of guilty was returned against the male prisoner, and he was sentenced to five years' penal servitude; but the woman was acquitted on the ground that she had acted under the direction of her husband.

What the real name of this convict was, is even now not known with certainty to the authorities. During the week of the first remand, however, we in our division had come to speak of him as Single-handed Smith, and so we speak of him still, when, as sometimes happens, his exploits crop up in conversation among ourselves.

## THE MONTH:

### SCIENCE AND ARTS.

FROM some experiments which have been lately made in the United States, it seems probable that nitro-glycerine may eventually supersede gunpowder as a charge for shells. In the experiments referred to, shells filled with this terrible fluid were fired from a twenty-pounder fieldpiece with a charge of three pounds of gunpowder. In one case, where the gun was aimed point-blank against a bank of soft earth, the shell scooped out a cavity in the soft soil of eight feet in diameter, and no less than five feet deep. For comparison of results, an ordinary shell charged with common powder was fired into the same bank from the same distance, when the hole made was only two and a half feet in diameter, and but one foot deep.

As a precaution against fire, some scenery at one of the Brussels theatres was coated two years ago with a composition largely consisting of alum and asbestos. Recent experiments with scenery so prepared have demonstrated that the canvas can be thus rendered perfectly incombustible. The invention is due to an engineer in the town; and the process will now be adopted throughout the country. It is said that this

simple application does not interfere in any way with the material upon which the scenes are painted, nor does it have any prejudicial effect on the colours employed.

It would seem, according to a Dresden newspaper, that disasters to eyesight are far more common than is generally supposed. It is there stated that in Germany and Switzerland more than two million glass eyes are manufactured every year. One French house alone manufactures three hundred thousand annually. The greater number of the unfortunate purchasers of these artificial eyes are labourers and artisans, more particularly those who are exposed to fire and who are employed in ironworks. It is stated that an artificial eye seldom lasts for more than five years, for the natural secretions of the glands cause the surface of the glass to become cloudy. The imitation of the natural eye is so exact—the pupil being made of coloured glass, and red lines being painted on the inner surface to simulate veins—that it is with extreme difficulty that a man with a glass eye can be distinguished from those with natural sight.

A new primary battery for electric-lighting purposes has been invented by Mr C. Maltby-Newton, C.E., who claims for his invention the following advantages: It will give a constant current, affording a brilliant and steady light for one hundred and twenty hours without any kind of attention; and the battery need not be run off for these one hundred and twenty hours at a time, but may be used for an hour a day or an hour a week until exhausted, as may be required. The fluid used is non-corrosive, and gives off no fumes. The new battery is introduced to public notice by the 'Electric Light Syndicate of West Street, Finsbury, London,' and it is intended that it shall be hired by consumers at a nominal rental, and be recharged when required, and generally kept in working order by the Company. The cost of using this new form of battery is estimated to equal that of gas at four shillings and sixpence per thousand feet. The apparatus has no machinery to get out of order, and it can be kept in any outhouse, shed, or cellar.

It is worthy of notice, as showing the gradual introduction of electricity for unusual purposes, that the captain of the South Coast Tricycle Club recently rode a machine lighted by a small incandescent lamp fitted with a reflector. It is said to have given a good light, and the experiment was in every way a success.

An interesting paper, entitled *The Coloured Race as a Problem in Sanitation*, was recently read by Bishop Penick at a Public Health Conference at Louisville, United States. In the course of this paper the writer said that the negro since his emancipation had degenerated in a very marked degree, and that he is dying off fifty per cent. faster than his white brothers. He also said that the death-rate among the coloured race was much larger than its increase; and he argued from this, that unless something was done to prevent this mortality, the race would in time become extinct. A curious commentary upon this view is afforded by a paragraph in the *Scientific American* to the effect that a coloured woman in Marion County recently died of measles at the age of one hundred and twenty-two years. She retained all her

faculties up to the time of her death, and said that she had never taken a dose of medicine. In the last cotton-picking season, she took her share in the work, and did that work well. It is stated that her age is attested by authentic records.

A contemporary gives particulars of a very singular surgical operation. A year ago, a man at Huntingdon attempted to murder his sweetheart by stabbing her with a sword-cane, and was duly sentenced to penal servitude. His victim gradually recovered, but constantly maintained that a portion of the blade still remained in her body. In this conjecture it seems she was right, for a piece of steel more than six inches in length has just been taken from her. The most peculiar part in connection with the operation remains to be stated. The original wound was in the girl's chest, and the blade has been extracted, broken end first, from her back, so that during its sojourn in her body the piece of steel must have turned completely round. Her recovery is only a matter of time.

A new grain-drying machine has been invented by Mr James Black, Dumfries, who was formerly a kiln-man, and was thus well acquainted with the problem to be solved. The machine, although a small one, will dry at the rate of forty bushels an hour. It consists of an iron case, in the interior of which are four wire cylinders extending its whole length, about fourteen feet. The heated air from a furnace below rises through this case, and gradually dries the grain, which is supplied at the top, and is carried from cylinder to cylinder in turn, and eventually discharged perfectly dry. An exhaust fan expels the steam as it rises from the grain. It is said that the drying is more equal than when effected in a kiln, and that the heating can be done at far less cost. The machine has another advantage in being portable, for it can be shifted from place to place.

According to a paper read by Dr T. D. Crothers before the Society for the study of inebriety, there are now in America fifty different hospitals for drunkards. These contain more than one thousand patients; besides, it must be remembered, another thousand who are under treatment outside the hospitals. In most of these cases, the disease—for inebriety is now looked upon as a form of disease—had existed for many years. It is said that thirty-five per cent. of the cases under treatment are permanently restored. Dr Crothers considers that the marked intensity of inebriety in America as compared with Britain may be ascribed to the 'greater intensity of nervous function.' He does not believe in so-called cures or antidotes for this form of 'drunkenness,' but maintains that each case should receive special study of its peculiarities, and should be subjected to strictly scientific treatment.

The following method of preserving cut flowers has recently been published. An inverted glass shade is placed in a soup-plate or other non-porous vessel, and surrounded with water. The fresh-cut blossoms are then placed under the shade, and at the same moment a small quantity of spirit of chloroform, that is, chloric ether, is dropped into the water. Flowers thus treated will, it is said, keep fresh for months; but the operation of placing them beneath the shade and pouring in the chloroform must be done quickly.

The occurrence of unusually hot weather has always the effect of calling attention to methods of purifying water; and there are now under discussion some new systems of cleansing waste waters with a view to prevent the pollution of rivers. One of these which is attracting attention is a process suggested by Dr Gerson of Hamburg. According to this process, the waste water is first of all placed in a reservoir and treated with chemicals, which form a precipitate. This precipitate is mixed with peat and used as manure. The remaining liquid is now subjected to filtration through a mixture of sawdust and peat, by which any colouring or offensive matter is at once abstracted. The result is a water which is perfectly odourless and tasteless; and this applies even to liquid which is the refuse of dyeworks and tanneries. The system is said to be economical, as the by-products are of almost sufficient value to cover the cost.

Our readers will remember that a few years ago we gave a full description of Mr Fleuss's diving apparatus, and also of the application of that invention to the saving of life in gas-laden mines or other noxious atmospheres. The same indefatigable inventor has now successfully applied his talents to the production of a domestic hand ice-machine, by which small quantities of ice can be readily produced. The machine acts upon Carré's principle, which is described in every physical text-book. This process consists of vaporising a portion of the water treated by means of a vacuum, aided by the absorptive action of sulphuric acid. The machine will be of great value not only in ordinary households where small quantities of ice are constantly in demand, but also to yachts and other vessels not provided with the power which is necessary to actuate the freezing-machines which are used so largely in steam-vessels. The machine is small and compact, and is not costly.

Dr Thomas Taylor, microscopist to the department of Agriculture at Washington, has in the last annual Report of that department shown, by means of photo-micrographs and coloured plates, illustrations of the crystallisation of butter and other animal fats. He shows that the fats of different animals differ in their crystallisation, and asserts that if butter, lard, and beef-fat are separately boiled and gradually cooled, the crystals that are formed will show marked differences under microscopic examination. These differences are easily to be seen in the photographs alluded to, and they point out a ready means of detecting butter which has been adulterated by spurious fats.

Methods of identifying artificial butter are of peculiar interest just now, for the Houses of Parliament have recently discussed the subject of these substitutes for butter and the name by which they should be called. It is now resolved that the word 'Margarine' shall be used instead of 'Butterine'; and dealers who fraudulently supply the artificial for the real article will be subject to heavy penalties. Margarine when properly made is by no means an unhealthy compound; but it should of course be sold for what it is, and not for genuine butter, as has been the custom among certain dishonest traders. In Germany, it has been proposed that margarine should be mixed during preparation with one of

the products of the dry distillation of tar, which would in no way affect its taste, wholesomeness, or general appearance; but the mixture so treated, when brought into contact with a solution of soda or ammonia, would become bright red. This result would also follow if genuine butter were adulterated with even a small quantity of the prepared margarine.

The question of the danger attending the use of arsenical wall-papers has recently been revived by the *Lancet*. It is stated that, contrary to general belief, green is not the only colour which should be avoided as being likely to be charged with an arsenical compound, but that various other gaudy wall-papers are contaminated with the noxious metal to a considerable extent. Flock-papers should be particularly avoided, for the rubbing off of the flock causes the colour to be disseminated in the air as a fine dust, which can be readily drawn into the lungs. Arsenic is used in the preparation of many colours which cannot be truly described in themselves as arsenical. Thus, many of the aniline pigments have arsenic present in them, generally as an impurity caused by careless manufacture, and magenta is one of the colours which is likely to be so contaminated; so that the conclusion to be drawn from these remarks is, that the colour of the paper is really no guide to the presence of or freedom from arsenic. The tests for the presence of this metal are comparatively simple, and can be performed by an unskilled hand. They are fully described in any text-book of chemistry.

It has been stated that a substance resembling ivory, of great hardness and of creamy whiteness, can be made from potatoes. The tubers must be of good quality, and after being washed in diluted sulphuric acid, are boiled in the same liquid until they form a dense and solid mass. They are then freed from the acid and slowly dried. This artificial ivory can be dyed and turned in the lathe, and applied to any of the uses for which real ivory—now becoming so scarce—is usually employed. It remains to be seen whether this imitation ivory will answer for many purposes as well as celluloid. It certainly should be much cheaper to manufacture.

The ash from the volcano Cotopaxi has recently been analysed at a certain place where it fell, a distance of one hundred and twenty miles from the mountain. It was found to consist of quartz, felspar, magnetite, and specular iron ore. It is curious to note that silver was present in this ash to the extent of nearly two hundred grains per ton. This seems a very small proportion; but when we consider the amount of ash ejected during one eruption of the volcano, which is spread over the vast area indicated by the distance at which this sample was collected, it must be seen that the total quantity of the precious metal distributed throughout the dust is really enormous.

The results of some inquiries as to the condition of certain trees in the Park and grounds of the capital at Washington are contained in the pamphlet issued by the United States Department of Agriculture. It seems that some of these trees have been completely denuded of foliage by the action of destructive insects, and the matter has now really become serious. It was hoped that when the English sparrow was imported

across the Atlantic, that the mischief would cease; but it now seems that the pugnacious little bird has rather protected these insects, by driving away the native birds which used to feed upon them. It is to be hoped that the close attention given to this important subject will lead to some remedy being soon adopted.

A recipe for a good and cheap disinfectant has recently been published. It is compounded as follows: In a pint of water are dissolved thirty grains of nitrate of lead; in another vessel, two drachms of common salt are dissolved in two gallons of water; when the crystals disappear, the two liquids are mixed together; and after the precipitate which is formed has been allowed to settle, a clear fluid remains, which consists of a saturated solution of chloride of lead. This liquid can be used for all the usual disinfectant purposes, and a cloth saturated with it will speedily render the air of a sickroom sweet. Nitrate of lead is a cheap salt, and the mixture can be made without much trouble.

It has lately been pointed out that the banner of steam given off by locomotives may be regarded as a hygrometer or detector of the amount of moisture present in the air. If the atmosphere be already saturated or nearly saturated with water, and rain may therefore be looked for, the steam from the chimney is seen to hover in an uncertain manner over the train, and will sometimes form a cloud one hundred feet long or more behind the moving carriages. In dry weather, on the other hand, the steam rapidly disappears, and in some instances it is so quickly drunk up by the thirsty air as to make no visible cloud at all. Those who live near railways have, therefore, a ready means of ascertaining whether wet or dry weather may be expected by the appearance of the cloud from the locomotive chimney.

A new industry, and especially one that makes good use of what has hitherto been regarded as a waste product, is always a matter of great interest and importance. Such an industry has recently been established in South Staffordshire, its object being the preparation of basic slag for agricultural manure. For this purpose, the Staffordshire Steel and Ingot Iron Company at Bilston has recently laid down extensive plant for grinding the slag. The machinery used pulverises the material to such an extent that the finished product will pass through a sieve of ten thousand holes to the square inch. The manual value of this slag is due to the large quantity of iron and phosphoric acid which it contains.

The sunflower has hitherto been valued in this country chiefly for its poetical fame, latterly as an aid to æsthetic decoration, and has also been turned to the more prosaic purpose of poultry-feeding, its seeds being much appreciated by domestic fowls. According to a Cuban journal, the plant is cultivated in certain swampy districts with great advantage to the general climate. From observations made during the month of June 1885, it was found that a quarter of an acre of these plants will give off in a day sixty-five gallons of water in the form of vapour. There seems little doubt that the flower not only acts as an absorber of water, but that it destroys malaria. It of course emits, as all plants do, pure oxygen in exchange for the carbonic acid it appropriates; but it is suggested that possibly the aromatic

odour of the sunflower may be possessed of anti-septic properties.

It has recently been stated that ninety per cent. of wild animals which are kept in confinement are subject to heart disease ; but this complaint is by no means the only one which attacks animals artificially reared. The elephant is specially subject to a number of diseases, of which the most fatal seems to be rheumatism. The monkey tribe generally succumbs to bronchial affections and heart disease. The tigers, lions, and felines generally suffer from heart disease, coupled with dysentery ; while the canine tribe seems to be almost free from these ailments.

According to *Iron*, a Norwegian engineer has succeeded in contriving a number of articles, made of reindeer hair, instead of cork, for life-saving purposes. His attention having been called to the great buoyancy of reindeer hair, he made a number of experiments, and constructed the apparatus referred to. One article is a bedstead or couch which can readily be converted into a small boat. This boat, although only calculated for the support of two men in the water, is found to sustain three with ease. A dress has also been made of reindeer hair, clothed in which a man cannot sink ; it is asserted, indeed, that reindeer hair will support ten times its own weight. Beyond these advantages, the material has the property of furnishing a costume which is warm and comfortable.

#### FINDINGS AND KEEPINGS.

It has been my fate during the whole of my life, from the time I was seven years of age, to find odd articles of more or less value lying in my path, to which I have rarely been able to find owners. The old saying of 'Findings keepings' has been verified, except in three or four instances which, curiously enough, were of the most value pecuniarily. My first 'finding' was when running home from school one frosty afternoon, I slipped on a slide and fell on the pebbles. I was on the point of screaming—had, I believe, opened my mouth for that purpose, when my eyes caught the glitter of a fourpenny piece between two stones, and in my eagerness to pick it up I quite forgot whether I was injured or not, for I ran home in high glee to show it to my father and mother. They seemed to think little of it, however, and laughed at my eagerness. Not getting all the sympathy I expected, I ran off to my grannie.

'What a lucky little maid, to find silver before anything else!' she exclaimed. 'Let me bore a hole through it, dearie, and put a blue ribbon through it, and you'll never be without money as long as you keep it. It's good-luck to find silver.'

At that time, I failed to see the double meaning in my grannie's words ; but whether the words took hold of my childish mind, and the wish to find things caused its own fulfilment, by rendering me more sharp-sighted than usual with children, I know not ; but certainly from that time it was curious how often I used to be running home

with stray articles I had found in one place or another.

Just before Christmas, I found an *Old Moore's Almanac* ; and during January following, two cambric handkerchiefs, one nearly new, with A. S. embroidered in satin-stitch monogram ; the other rather worn and unmarked.

One Valentine's Day (Sunday) I went to church with my mother. Kicking the snow before me on the road, I saw something glisten in the sun. I stooped, and picked up a tiny chased gold pencil-case, like those that are often hung on watch-guards. Imagine my delight, and chagrin, when my mother quietly took it from me and put it in her pocket. I am afraid I thought of little else during the long morning service. It was locked up in my mother's desk till she made inquiry as to its owner ; then, after a year or more passed by and no owner turning up, it was considered to belong to me.

During the four following years I found a baby's coral and bells, nearly new, in the hay-fields ; a pink silk necktie ; a book-mark with a spray of ivy, and 'Lucy' worked on it in silk and beads ; two half-worn cedar pencils, a book of *Scotch Songs* much worn, and two horseshoes. The last-named were nailed to the back-kitchen door and painted black. The book gave me my first insight into the breezy poetry of Scotland. Nearly all the shorter songs in the book I got by heart.

Some months passed by and nothing came in my way. I was fully employed both at school and home, and seemed to forget all about the matter. My fifteenth birthday, at the end of June, however, was exceedingly warm and oppressive. I had some school-friends coming to spend the evening and have tea in the home-close. In the afternoon I went up the town to get some cakes and ice-creams. When crossing the market-place, just in my path lay a beautiful little brooch, with a Swiss chalet delicately cut in ivory, enclosed in an oval gold rim. This, after showing it to my mother, I pinned on my dress, and regarded it as an especial treasure, having found it on my birthday. I wore it for several weeks. One evening, a young lady, who had lately become the wife of one of the bank partners, called on my mother, and in course of conversation remarked she had lost an ivory brooch that was given her by her husband on her wedding tour.

My mother smiled, and called me in from the garden, saying : 'I believe Janet is wearing your brooch at the present moment. She found it on her birthday, and has not, I think, put on any other since then.'

Mrs L—— was delighted. She offered to pay me the value of the brooch, or give me another in its place. This offer was declined. I was glad to be able to find an owner for one of my 'findings.' I told her this. The remark led to my mother telling about the curious luck I had in picking up lost articles. Mrs L—— was much amused and interested. The following day came a graceful note with a handsome volume of Longfellow's *Poems* 'for Janet,' and an invitation to

spend the evening with her. Needless to say that I accepted with delight; and from that evening dated a close friendship, which deepened and ripened as years passed on.

The following winter I spent in London with some relatives. Going through the Green Park one morning as soon as it was opened, I found a good brown silk umbrella with ivory handle lying on the grass under a tree. I made it known at the keeper's lodge and gave my address; but no one claimed it. A few days after, coming out of church in a snowstorm, I stumbled over something soft. Looking down, I saw a dark mass on the path, which proved to be a warm woollen wrap of a rich dark crimson, beautifully knitted and finished. This was my constant companion for years, and when worn out, I stuffed a cushion with it.

Two or three Shetland veils that are worn by infants came into my hands, and a parcel of school-books was found in Birdcage Walk. Two of these had an address written in, and were duly returned.

In the spring I was visiting near Reading, and one fine Sunday afternoon I walked with Miss E—— to the lovely little church at Mapledurham, going through the fieldpaths and along short shady lanes in their first spring beauty. About half-way up one of these lanes I picked up sixpence. Miss E—— laughed, and said it would do for the bag at church, when suddenly she cried, 'O Janet!' and showed me half-a-crown she had found in a deep rut. We looked about; and between us found sixteen shillings and fourpence-halfpenny in various coins; and a little farther on, a knife with four blades and buckhorn handle. It was nearly a mile from any house, and though we made inquiry, no one claimed either money or knife. Two days after, on returning to London, and crossing one of the flights of steps over the rails at Paddington, I found a handkerchief with deep black border marked 'Alicia Early.' In connection with this, I must mention that four or five years later, while waiting for a friend in Manchester station, the Liverpool train came in; and I noticed half-a-dozen large travelling-trunks turned out of the van, on which 'Early' was marked in large letters; and a small parcel had 'Alicia Early' written on it, with 'Passenger from Rio Janeiro.'

While staying at Oxford in Commemoration week, a party of us had been to see the boat-races, and were resting under the trees in the Broad Walk, when four or five young men passed with a huge mastiff at their heels. Nearly opposite to us, the animal rolled down on the grass, scrambling and scratching in usual dog-fashion. As I was admiring the dog, I caught the glitter of something bright turned over by one of its massive paws; and on going to the spot, found an old-fashioned double gold locket, the ring of which was broken. On opening the locket, a small photo. of a young grave-faced soldier was on one side; on the other, a lock of soft baby hair, and the words, 'My only son—Sebastopol.' I have the locket in my keeping still, and often wonder who was the tender, heart-broken woman who lost that precious memento of affection. Who knows the tears that have been shed over that little photo., probably the only one the poor mother ever possessed!

Late one wet Saturday night I was walking home, when I saw a small twist of white paper in the mud. I kicked it forward twice without a thought of what it might contain, when it struck me I heard the chink of coin. Taking off my glove, I picked it up, and, being only a few steps from home, carried it there. The paper contained four shillings and sevenpence, with a list of several articles of grocery; but no name to show to whom it belonged. Most likely, dropped by a child sent on the errand.

A silver brooch, minus a pin, next came into my possession; and part of an eardrop of plain gold set with a pear-shaped cornelian. Two or three handkerchiefs followed, and a child's muff with one scarlet glove inside.

In August 1868 I was again in London. One morning I started from Brompton to walk across the Park and Kensington Gardens into Bayswater to see some friends. When nearly there, I sat down on one of the iron seats a few minutes to cool myself. The seat was one of those made with flat iron bars about three inches apart. Just as I was moving to leave, I saw a small black handbag lying under the seat. It was pretty full. A little parcel contained two pair of black kid gloves and some white lace; another, a jet pendant set with seed pearls in the shape of a Maltese cross, that had evidently been mended at the back; and a small copy of Shelley's Poems, with 'Salome from Jose' written on the title-page in a masculine hand. Inside the bag was a small pocket with a Russia-leather purse, and an envelope without any address, containing a long letter, on foreign paper. There was also some loose change in the pocket; and three or four trifling bills without any name but that of the firm. The purse contained three sovereigns and a five-pound Bank of England note; and a cheque for two hundred and forty-four pounds, to be paid through a solicitor to Salome M——.

In the utmost astonishment and some trepidation, I hastily thrust the money into the purse, and the other articles into the bag, and shut it up. What to do I hardly knew. Several people were passing backward and forward, as I sat there quite bewildered with the thought of what I should do for the best. A man and child came and sat down on the same seat; and after a minute or so, I walked quietly towards the Park gate. As I went out, a tall boy of fourteen or fifteen ran hastily past me and along towards the seat where I had been sitting. I stepped back into the Park and stood under the nearest tree and watched the boy hurry up to the seat, and after a look round and under the seat, was evidently questioning the man, who pointed towards the way I had come. The boy then came back again, eyeing me keenly, beckoned to a policeman whom I had not noticed before, standing just outside the Park railings.

I could not help smiling at the ridiculous yet serious position I was in, for I was now aware I had been watched while watching the boy. The bag was under a loose mantle I wore. The moment the boy looked at me, I felt sure the man on the seat had given him a description of my personal appearance; but when I smiled and looked at the policeman, he touched his cap and said: 'Beg pardon, ma'am, but this young gentleman has been sent to fetch a handbag left

on that seat yonder by his ma, that has valuable articles in. Have you seen such a thing?'

'I have found such a bag; but you must tell me what the contents are before I shall feel justified in giving it up.'

Policeman X. looked at the boy, whose countenance fell, and he glanced at me angrily, saying: 'Mother did not tell me, only that I was to run and get it if possible; she was so upset over my sister's accident.'

'What is your name?' I asked.

'Josia M——,' he answered; 'and my sister's is Salome Josephine. We live at the end of the square over yonder. Come with me, and take the bag to mother yourself.'

Policeman X. stepped forward and said: 'That's the best plan, ma'am; we will go at once.'

For the first time in my life I was escorted by the police to the square where Mrs M—— lived. I saw a beautiful but anxious face looking from the window as we approached; and a lady in deep mourning answered the door and conducted us with uplifted finger into the room, where on a couch lay a lovely child of six or seven. She was fast asleep, and her forehead was bound up, and the thick fair curls were wet and blood-stained.

An explanation followed. Mrs M—— and her children had been crossing the Park; the little girl in the highest spirits ran forward and climbed on the seat to jump off; the toe of her boot caught between the bars, and she fell violently forward on the gravel, cutting and bruising her head severely, and rendering her unconscious. Mrs M—— and her son picked up the child as quickly as possible, hastened home, and sent for a medical man. In her haste and fright, Mrs M—— threw down the bag; and it was quite forgotten till the child came round, when she sent her son to see if haply he might find it or obtain any clue to its loss. The result has been told.

I stayed half an hour with Mrs M——, and found she was going the following week to join her husband in New York, having been detained through the illness and death of a girl of twelve from accompanying him, some weeks previously, to investigate some business affairs. She was evidently in great distress of mind, and I was glad to have been of some service to her. We took a cordial leave of each other; but we never met afterwards.

After I had returned home some months, I was strolling through the fields at the side of the turnpike road, when I heard a horse and trap approaching at a terrific pace, and I ran to the nearest gate to look through. A light, high dogcart, drawn by a young fiery horse, tore rapidly by me; but I could see that the groom had the sense to remain cool. I listened attentively, and found, after about half a mile or more, the speed was reduced, and then lost in the distance. I climbed the gate and returned along the road. About a hundred yards along by the side of the road lay a large double black-and-white checked plaid. Of course, it had dropped from the dogcart. I carried it home, had it advertised; but no one claimed it.

One snowy day I was crossing Bull Street to the post-office, where a path had been made, when I saw half-a-sovereign lying on the stones.

Just at the same moment a farmer's man leading his horse caught sight of it and picked it up. As he did so, he cried: 'Halves, ma'am. You seed it first, and I picked um up.' There was a good-tempered sparkle in the man's eyes as he spoke, yet I detected a look of anxiety on his face as he held the gold on his open palm. 'All right, my man; it's more yours than mine; and most likely you want it most,' I answered.—'Ay, ma'am; it'll buy the missus some good boots, and she do want some bad, I reckon.—Thank ye, ma'am.' And we parted company with equal cordiality.

A large, new india-rubber ball next came into my hands; several letters that had been dropped, stamped and ready for posting; a Roman Catholic mass-book; and a roll of new music. The last two I found in one of the retired streets in Leamington as I was hurrying to catch a train north. This shows how easily odd articles are lost, and also how difficult it is in most cases to return them to the owners, or for the losers ever to recover their property. In all probability, the number of articles lost yearly amounts to hundreds of pounds, without taking into account hard cash, or the more costly jewelry that is well advertised. Much of it gets into the hands of careless or indifferent persons, who will take no trouble to return it or find owners; and far more, I am afraid, is retained by a class still more unprincipled, who have means of turning 'findings' into ready-money.

## OCCASIONAL NOTES.

### SILK-GRASS.

ALTHOUGH many attempts have been made to bring out machines for the decortication of the fibre of the Pita plant, or 'silk-grass,' it is curious to learn, from an American consular Report, that the plant has never been cultivated, but grows wild in patches on the borders of rivers and lagoons in Honduras. The stalks of the plant contain the fibre of commerce, and these grow to a height of twelve or fourteen feet. The Indians scrape off the hard skin of the stalk with a bamboo knife, and thus obtain the fibres, which form the heart of the stalk. Another plan is to steep the stalks in water until the skin decomposes; but this is said to injure the fibre somewhat. In Honduras, the pita fibre is used chiefly for thread, nets, fish-line, and cordage; while some of that sent to Europe and America is manufactured into lace handkerchiefs, ribbons, and wigs. Although many attempts have been made, no machinery has yet been invented capable of decorticating this fibre on a profitable scale; but were this once accomplished, the wild pita-fields of Honduras would become most important in the commercial world. In fact, the opinion is even now expressed that in a very short time they will become the centre of an industry for the supply of fibre to Europe and the United States.

### THE INDIAN FOWL.

There he stands, a ragged, dingy, brown bird, but game to the backbone. He is an important bird, as, but for him, the Anglo-Indian would have poor times. Beef and mutton are not to

be had every day in the Mofussil, and when procurable, only two or three times a week. But fowl is to be had. He is the mainstay of the Indian *khansamah* (head-servant or steward), especially the dāk-bungalow *khansamah*. There is a form always gone through on arriving at one of these bungalows, something after this fashion: 'What can you give for dinner, *khansamah*?' asks the traveller.

'Whatever the sahib likes,' replies the inn-keeper in a grand tone, as if boiled elephant could be had on short notice.

'Well, give me some beef.'

The *khansamah* is very sorry—no beef to be had.

'Mutton, then?'

No mutton, either.

You feel you have done everything in your power, and leave it to the *khansamah*; and he gives you fowl—fowl soup, fowl cutlets, fowl curried, and fowl done up in a dozen different ways.

But he must be caught before he is cooked. A fowl with weak intellect, or a young and silly bird, may be inveigled by a handful of corn and fall an easy prey; but the veteran who has escaped many a design on his life is quite another thing. He will eat as much corn as the *khansamah* likes to give him, but will keep his weather-eye open and not get within reach. Then the *khansamah* girds up his loins and calls up his whole establishment and prepares for a hunt; and a hunt it will be. The veteran fowl has the fleetness of a greyhound, and will give good sport. Avoiding the grasp of the *baworchee* (cook), he takes refuge under the raised floor of the bungalow. Dislodged thence, he dodges between his would-be captors, and goes sailing away under the compound railing, over the ditch, on to the road. This is an unlucky move. A pariah dog, which has been sleeping on a dust-heap on the road, oblivious of fleas and mange, and dreaming perchance of the last bit of carrion he finished half an hour before, wakes up, and gives chase. In trying to escape this new enemy, the luckless bird flies into the clutches of the others. His fate is soon sealed; and shortly after he is dished up. As you survey him with a pitying eye that such pluck should be sacrificed for the table, for he is a most tasteless bird, you cannot but wonder at the enormous amount of bone and muscle he exhibits. In fact, he and his brothers scorn to get fat. They will lead a lazy life, and one of content, from a fowl's point of view, but they will not get fat. In this they are unanimous. Many are the allusions the hungry traveller makes on this peculiarity of the bird. The *khansamah* is, however, proof to this. So he smiles meekly, and holds his peace.

The Indian fowl has periods of excitement to ruffle its otherwise smooth career. You are awakened early in the morning by a tremendous clucking. You are sleepy, and as you turn over dreamily, think perhaps a jackal has got into the hen-house. This is explained later on, however, by the presence of an eggcup on the breakfast-table. Out of the bottom of this you scoop an egg the size of a marble, and eat it at one gulp. Alas for the motherly expectations thus cut short! But the Indian fowl is a philosophical bird, and does not make a fuss over the inevitable. She

will go through the same experience day after day, until she is consigned to the pot, and will appear at your table the same lean, muscular bird as the hundreds you have eaten before.

Honour to the Indian fowl, and may its shadow never grow less! Some say we keep India by the sword; but it is our firm belief that if all the fowls emigrated from here to-morrow, we should have to accompany them, and leave the land to the Bengalee Baboo and the Russian.

#### TWILIGHT DREAMS.

'SING to me, dear!' The voice came through the gloom  
And glimmer of the quiet firelit room,  
To me, who, filled with thoughts of other days,  
Heard dimly, and saw all things through the haze  
Of sweet, sad memories of lost delight.

So I but faintly stirred; and, in a dream  
Of all that had been, murmured: 'Yes, the stream  
Flows clear and gently! Let us float along,  
And you and I will sing a happy song  
Of true heart's truest love and love's delight.'

'O love! the waters are so blue, so blue,  
And my heart, O my love! so true, so true,  
And all things beautiful and all things rare,  
As nothing are beside thy face so fair—  
Thy face, my beautiful, my heart's delight!'

'Nay; but call back thy thoughts, sweet sister mine;  
The deep sea-billows over what was thine  
Surge to and fro; and thou art left alone,  
With but a brother's love to call thine own;  
And yet, for thee, life holds some small delight.'

'O brother!' I made answer, 'it is true  
That all of life's dear hope, beneath the blue  
And smiling waves, lies hid in ocean's heart;  
But spirits are not sundered; do not part;  
They meet, in dreams like mine, of past delight.

'And if no more upon the solid ground  
Or treacherous wave we meet, we still are bound  
By faith's strong tie, and love's bright golden chain,  
To one another, till, in bliss again  
We meet, and dwell for ever in delight!'

F. E. HUNT.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

## IN THE HIMALAYAN COUNTRY.

THE country of the outer Himalaya—the tracts which form the base of the vast triangle which has the isle of Ceylon at its apex—is the most charming for climate and the most surpassing for grandeur and beauty of scenery of all the districts, countries, and places of India. The writer is familiar with but one part of this long line of territory, and of that part he takes up his pen to give some account; but he believes that he may say with correctness that there is vast similarity everywhere along the great wooded base which looks down on the plains of Hindustan, in front of the eternal snows, from the Punjab territories, far to the left, to Darjeeling and parts adjacent and beyond, away to the right. You have the same sanatoria for British soldiers; hill-stations for the European community generally, which vary only as one English town differs from its neighbour; and nestling in nooks all over the hillsides, you have the same sort of native inhabitants, semi-Hindustani or Indian and semi-Mongolian in national type.

Of late years, the most notable movement in these mountain districts has been the establishment of the Forest Department by the government of India, which has, by the hands of this department, assumed formal possession of all the great forests; has set about taking care of them; and, further, of multiplying and increasing both the area and the best natural products of these enormous and majestic wildernesses. Noble are the mighty hillsides, indeed; and in the verdure with which they are clad may be counted many varieties of pine and classes of kindred genus. The *deodar*, which we believe is a cedar, is esteemed the most valuable. In the hill-tracts which face the upper provinces of India, the mountains generally are wooded only on the sides looking backward to the higher ranges, the snowy chain behind; and the slopes which look south, to the sun, are yellow and bare. At points along the line of railway which runs for many a hundred mile from Calcutta in the south-east

to far-distant Peshawur, right on the distant verge of empire, one can alight to go to the hill-station of his choice or to which duty draws him. Darjeeling, which is now a great place, can be reached from Calcutta direct; and by going up the line, one can alight for Naini Tal or Mussourie, for Dalhousie or Simla; but to get to these places, after leaving the main line, one must undertake a second journey, which varies in length and in difficulty with the station selected. But refreshing it is, when you *do* get there, and you can appreciate then what ‘climate’ means; and you are apt to go about enjoying each mouthful of the fresh air, with hands extended, as if to grasp and weigh and feel the delightful commodity.

The climate would be considered good and bracing for any country in the world; and the Forest officers are quite appreciative of the great advantage that in this respect they enjoy; and they cling to the hills, although, as compared with some other departments, the Forest is not well paid; while the life is often one of complete isolation. The Forest officials have rather a difficult course to steer in their dealings in the way of duty with the native communities of the hillside and the glen. The villages are legion; they are scattered about everywhere, and they have, the writer infers, many claims, coming down probably from unknown antiquity, which are apt to clash with the great claim of imperial lordship. But the department appears to be very wisely guided; and the officials are trained men, not rarely of high scientific attainment; learned in all native languages, and in social position equal of course to any. Jolly little cribs some of the Forest huts are, and in much, very un-Indian like; but covered with trellis-work and creepers, half hut, half bungalow, they carry one away from things Indian, especially when the sun is sinking low behind the great mountain walls, and the air is getting chilly, chilly. Very pleasant then to turn inside, where the little room is ruddy with the light of the roaring fire. On the sward near the house you may

see, too, English daisies; but *they* do not come naturally; for if they exist, they are due to the horticultural tastes of the officer of the circle. The villages are low in the interlying valleys, but sometimes on the slopes of the hill. Some look like a collection of Swiss cottages, two-storied and roofed with slate; and Swiss or not, certainly unlike anything in the lower regions, 'the plains,' from which we have just ascended.

In one large village which the writer visited, he was struck with the fine appearance of the female community. They looked far finer beings than the men, and were full in form, with remarkably large and expressive black eyes; and, generally, buxom of figure and expressive of face; while the men appeared very ordinary, thin, and shabby creatures.

Another charm of 'the interior'—as the regions lying away from the hill-stations are called—is the pheasants. Here you get the noble birds amid the noble forests. There are several varieties, but the most prized is the *moonal*, which is got at the highest elevation, and whose coat is of a beautiful azure. You may be 'worse off,' indeed, than to be wending your way home to the hut carrying a heavy pheasant, which you have just bagged on the soft grassy brow of some great declivity; turning, now and again, to look at the sunset light still welling up from the sable deeps of the opposite ranges; and then feeling the frozen ground of the forest path crunching beneath your feet; while your retriever comes pattering after you.

There is other game than pheasants on these alps, however, very different; and the pursuit more arduous. Bears abound, and tigers are at times very troublesome. The bear, although not fond of showing fight, can maul most frightfully with his claws, which resemble those of a garden rake, and his favourite *coup* is to scalp. Mr F—, a Forest officer, lost his life by a fall from a precipice in an affair with a bear; and as to tigers, our host at Deoban, Mr S—, was the lucky man who, a few years ago, killed a man-eater, for whose destruction the whole station of Chakrata turned out, soldiers, civilians, and all, a comprehensive line; and the animal fell to the rifle of Mr S—. In a jar of spirits in the bungalow some human remains are shown that were found in the stomach. Close to Deoban, Mr G—, of the Forests also, a noted sportsman and shot, while walking along, heard some noise behind him, and discovered that he was being followed by a tiger. He signalled to his servant to hand him his rifle; and returning towards the striped animal, he 'let him have' a bullet in the head, and 'bagged' him; the shot being as accurately placed between the eyes as if done by a pair of compasses!

In the winter-time, the writer has seen the icicles hanging plentifully, long and solid, from the eaves of the Deoban bungalow; the snow lying deep everywhere, and the vast woods shrouded, silent, in the soft ghostly garniture. This spot is some nine thousand feet above the sea; and after a stormy night, the writer has seen the clouds lying like a great calm sea below one, with here and there the tops of hills for islands. The *coup d'œil* was superb and enchanting: the millions of surrounding trees

mantled in saintly snow; below one's feet, the floor of cloud, 'vast—motionless;' far away, the white bulwark of the eternal snows; and over all, in exquisite contrast, the pale blue of the sky, with the sun as yet unrisen. Such a scene is not often beheld, and forms a diamond locket for Memory to keep with her.

In the summer, which is always pleasant in these altitudes, wild strawberries patch the sides of the hills with red. Eaten 'one by one,' these have not much flavour; but munched by the handful, they do give out some characteristic relish, albeit a faint one; and they make very nice jam. Apricots are grown in the native villages, and these, too, are better as jam than eaten from the tree. Raspas and blackberries can also be gathered; and the writer remembers gratefully the confections made by a lady-friend resident at the neighbouring military hill-station; and all made from native fruit, supplemented by perhaps English strawberries. In the military station, in cantonments, you might well forget India, for everything looks so English. Neat brick buildings of all sizes, with slated roofs; brisk, stalwart redcoats; neat young English women passing by; and in the gardens below the railing-lined walk, little fair-haired English boys and girls laughing and playing. And the fresh, glorious air, how it comes in billows up the wide steep ravines, with the diminished trees and villages far away down! And looking level, you feel the sensation of being up in a balloon! Here the newly arrived regiments are sent when just out from England, to be 'set up' by a year's residence, ere going to their long spell of duty in the hot plains beneath. And the English look, mostly, as if the place did them good; and you may see as healthy visages and as rosy cheeks here as you could wish.

To revert to the strawberries. The writer recalls a time when he went strawberrying with the help of all his baggage coolies, to gather for jam-making; and how a favourite dog, Sancho, a water-spaniel, was as keen after the berries as any, and would hunt for them in company of his master, and with roguish delight would seek to be first at a good one, pouncing upon it with his paw; and with waving tail, and the white of his knowing eye showing, refusing to let go! A hill pony that had been for years in the plains enjoyed himself, too, on another occasion; and when he came to a stretch of snow lying by the roadside, would delight to go among it and to toss at it with his nose as he trotted through it. It is requisite in these parts to have horses that are accustomed to the hills, for animals coming up freshly are apt to get terribly puffed and blown with but little exertion. Ponies are preferable to horses, but the latter are extensively used. Not far from the cantonments of which we are writing is the spot where, in the year 1871, Captain Lillingston of the Forest department lost his life by his horse's foot slipping. He fell, not over a sheer precipice, but down a long grassy bank; and was found dead at or near the foot of it; and the horse too. A simple stone with an inscription and I.H.S. marks the place on the path by the lone hillside.

One branch of the work of the Forest department is the cutting of sleepers for railway pur-

poses, and the floating of them down the streams that wind towards the plains at the bottom of the ravines in the mountains. The deodar cedar is the best, we believe, for sleepers. This is a most important part of the department's operations. Another is to supply the cantonments with firewood; and lastly, it devotes upon them to offer a great deal of general hospitality, which they obligingly do, and at no small sacrifice, for many are the calls upon them, both upon their time and their cellar and larder, by friends well known and by the passing stranger.

It is a grand mountain country. The scenery is of great beauty and grandeur; often more bare and bold than beautiful; yet in the aspects facing the north, where the trees abound everywhere, one finds scenes of singular nobility; and on most days you can get a view of the higher monarchs, the eternal snows. These, however, are distant, and not, therefore, so imposing as imagination will figure them, and the snow appears at times as of a metallic tinge. But it is grand, nevertheless; and the air cold, bracing, glorious. Lovely are the pinewoods when the late afternoon sun is lingering among them; and the high bank where the wild thyme grows, on the misty morning when the sun is slowly climbing up from the east, there is health and pleasure and poetry there too; as there is when the aromatic scents from the forest side steal over one like soft and subtle music.

## RICHARD CABLE,

### THE LIGHTSHIPMAN.

BY THE AUTHOR OF 'MEHALAH,' 'JOHN HERRING,'  
'COURT ROYAL,' ETC.

#### CHAPTER XXXVIII.—ST KERIAN.

THE village of St Kerian, in Cornwall, lies about ten miles inland from the north-west coast. It lies in a hollow, a valley down which flows a little stream, that has its source in the granite moors that form the backbone of the long peninsula that constitutes the county of the Cornubritish. Up the valley, clothing its sides, where steep, are oakwoods, copse for the most part; and above the copse rise the bald moors, sprinkled with gorse, and in July, pink with heather, and purple shot with heath. The granite tower of the church peeps above some old lime-trees that form an avenue to the porch, and some Scotch firs that rise with flaky boughs from the churchyard boundary. There the rooks build and burden the velvety green foliage with their rough nests. The tower of the church is square, with the pinnacles cut to lean outwards, as the foliation of a crown—a Cornish peculiarity. Near the churchyard, communicating with it by a side-door, is the rectory garden, apparently one great pillow of evergreens, laurel and rhododendron, and myrtle and laurustinus; and out of this green pillow appears the slate roof of the parsonage, sunk so deep in the evergreens that only roof and chimneys appear.

The cottages of St Kerian are for the most part of kneaded clay—locally called cob—the warmest, suggest, driest material of which a house can be built; a material which, when used as a garden wall, ripens peaches, grapes, apricots on its warm

surface. It sucks in the sun's rays as a sponge, and gives out the heat all night. Stand by a cob-wall after a bright day, when white-frost is forming on the grass, and you feel a warm exhalation streaming from the dry clay. Fruit-trees must blossom when nailed against it; and the blossom cannot do other than set, and having set, must glow and swell and mellow and flush with sweetness. The flower-bed under the cob-wall is one that is rampant, luxuriant, always beautiful. In the winter months it is not bare; it has Christmas roses and aconites; it is throwing up and opening flowers at extraordinary times, and ripening strawberries at periods when no one dreams of strawberries.

A few houses are of stone, and the stone, like the cob, is whitewashed. These houses have slate roofs, and on the slate are orange and white patches of lichen; and on very old slate even masses of golden stonecrop. But the most subdued slate never reaches the softness and sweetness of tone of thatch—the thatch that covers the cob cottages. That is brown and furry and cosy. Verily, the cottars must be princes and princesses to cover their houses with sealskin!

One of the stone houses is the village inn, with the sign of the *Silver Bowk*. Why this sign? Because the legend told how St Kerian had gone to sea in a basin of pure silver, and in it had rowed over vast and trackless waters till he reached the land of Paradise. And all the time he was away, a wolf kept watch over his wallet and psalter, that lay on the beach of India.

St Kerian was, truly, none other than the man in the moon, and the moon was his coracle of silver in which he traversed the dark-blue heavenly seas. But of this the villagers knew nothing. They dimly recollected the old Catholic legend of the miraculous cruise of the patron saint of the parish, and knew that the great silver bowl on the signboard over the inn referred to the story.

Another stone house belonged to the blacksmith, George Penrose, a plain worthy man, hard-working in his forge and out of it: in it, hammering and moulding iron; out of it, digging and growing vegetables in his garden; and especially fond of carnations.

Outside the village, a rifle-shot from the last house that could claim to be in what was locally called the Church-town, stood a poor cottage, built of cob, with a thatched roof. This cottage was but one story high. You could have touched the eaves when standing by it. The door of the cottage opened on the road; but beside it, at one end, was a garden in the shape of an extremely acute triangle; one side was hedged against the road, and the back was hedged against the field. It was obvious at the first glance that this was the cottage of a squatter, who, in times past, when land was of little value, had squatted on a bit of waste ground beside the road, turned it into a garden, and erected the cottage for himself. No one had objected. If the lord of the manor had been told of it, he had laughed and shrugged his shoulders and asked no head-rent. No attempt had been made to dispossess the squatter; and as years passed and he had made no acknowledgment to any man for his house and bit of land, in time he became absolute proprietor of cottage and triangular garden, with

as good a right to it, to hold, to devise, to sell, as the best Squire in the neighbourhood and the most substantial yeoman in the parish had to their lands. The cottage had been dug out of a pit at the vertex of the garden, where was now a puddle, and a shivering white willow by it; and the triangle of ground had been reclaimed from the roadside by old Jonathan, the father of Zackie and of Bessie Cable's mother.

This was the estate—this, and seventy-eight pounds five shillings and tenpence—which fell as an inheritance to Bessie Cable on the death of her uncle; and to this freehold estate Richard moved with his mother and little children, and into it he settled; Bessie Cable being its sole and undisputed, and, indeed, indisputable possessor. Not another relative in Cornwall, nay, in the wide world, had Uncle Zackie. I am sorry to say it, but it is true, and must be said—the people of St Kerian did not hail the arrival of the Cables with enthusiasm, were by no means inclined to show them much hospitality. St Kerian's people were Cornish Kelts to the ends of their fingers and toes, without one drop of Saxon blood in their veins. They were a people who shut themselves up in their exclusiveness, as they were shut in by nature by their moors. It might be true that Bessie Cable was linked to the place by her mother; but her mother had chosen to desert the house of her childhood and 'go foreign'; and Mrs Cable was foreign born and bred; she did not even speak like a Cornish woman. All England, even Devon, and most of all the eastern counties, was foreign to the Cornishman, foreign as Timbuctoo and Alaska.

The St Kerian's people did not come out to meet and welcome the new landed proprietor and his family who came into their midst; they looked on him with suspicion and jealousy. Richard Cable, grown peculiarly sensitive and irritable, felt this, and resented it. He would have as little to do as was possible with the St Kerian's folk. Besides, he was disappointed. The cottage and the land were much smaller than he had expected. *Omne ignotum pro magifico*. He had imagined a roomy house, with gardens and paddock, and perhaps some out-buildings. He was wofully downcast when he arrived at the hovel in the wagon on the straw. The cottage was plainly furnished, and in tolerable repair. It was obvious that a hard time was before him. He was poor, though a landed proprietor. His estate, like that of so many Squires in the present day, would not maintain him. He would have to work, and work hard, to feed the seven little maiden mouths at home, as well as his own and his mother's. Potatoes, as he knew by experience, would go like wildfire; bread would vanish as moisture in the east wind. The three-cornered garden would not grow cabbages and turnips enough for all these little stomachs that demanded of it food daily. Think! Three hundred and sixty-five days make up the year. Multiplied by eight, that makes two thousand nine hundred and twenty meals—only one *per diem*—to be got out of that little garden; and that, moreover, without making any count of food for Richard himself. But they must have supper as well as dinner. For dinner, potatoes; for supper, kail; so that in reality

the demands on the triangular patch reclaimed from the roadside would amount—if the father was to eat anything out of it except earth and stones—to six thousand five hundred and seventy meals.

Richard Cable had always been a reserved man. He was now more reserved than of old. At Hanford, he had associated with his mates without ever becoming what they would call 'one of themselves.' At St Kerian he associated with no one. The Cornish people are inveterate talkers. It is said that a loquacious person can talk the hind-legs off a horse; if so, it is a wonder that any legs remain on the horses in the west. Everything is made to give way to talk—the most pressing business, the most urgent duties. Indeed, the most imperious call of a Cornishman's nature is to talk. It is said that in the navy the officers are shy of west-country sailors, because they are such talkers. The Cornish are a kindly people, who like their neighbours to be 'free' with them—that is, to run into their houses at all hours for a talk and allow them to reciprocate.

Dicky Cable went near none of the villagers of St Kerian, hardly spoke to them; when he did, it was on necessary matters. He let them understand that he objected to have his kitchen invaded at all times, and to have his proceedings scrutinised and canvassed. He was a busy man. He had to work for seven little children, and had not time to talk. With him, every minute was precious; it meant a patch on Mary's shoe, threescore stitches in Martha's stocking that he was knitting; the shaping of a wooden head to Bessie's doll; a bit of tilling of the garden that fed them all. Every idle minute sows a weed, said Richard.

The villagers, who grudged the invasion of the parish by foreigners, were not conciliated by Cable's manner; they could not understand that he had other crops to cultivate than goodwill.

Mrs Cable also, in spite of her Cornish blood, was no talker. Had she been a gossip, all would have been well. When you come across a Frenchman in a railway carriage or in a café, he tells you the history of his love, the circumstances of his marriage, and the ages and temperaments of his children; and expects similar confidences on your part. The Frenchman has a pleasure in turning himself inside out before you, like a glove. This is because he is a Kelt, and craves for sympathy. The Cornish are Kelts also, and they overflow with frankness, and exact reciprocity in candour. The St Kerian people wanted to know the complete history of the Cable family, and demanded it as a right. Bessie would tell nothing. The mother of the children was dead—that was enough for them to know. Of Richard's second marriage not a word was breathed; no suspicion of it entered a St Kerian imagination, and the Cornish imagination is no sterile faculty. As certain soils will grow all kinds of plants although nothing is sown in them, so with the imaginative faculty: it will produce crops of most varied weeds, growing where you could swear not a seed of fact had been dropped.

The times were hard for Richard. He had recovered so as to walk about; but he walked

lamely and could not go far. Work for which he was suited was not easy to be got. Work by means of which he could live at ease was not to be got at all.

The little patrimony that had come to Bessie Cable melted away. The necessary things to be bought, the doctor's bill, the bill at the *Maggie*, the feeding and clothing of the little ones—all ate into the seventy-eight pounds five shillings and tennence. Uncle Zackie had but a single bed. Now, several were needed, and they had to be purchased. One cup and saucer, and a single plate, a gridiron and a frying-pan, had sufficed for Uncle Zackie; this would not meet the requirements of nine persons, and had to be supplemented.

Then, again, all the clothes of Richard, his mother, and his children had been 'salved' in the wreck, and were therefore lost to him. It was necessary to buy fresh clothes. What had been 'salved' was past recovery.

Seven little girls! Was not that enough to break a poor man's heart? Was it not selfish and cruel of Polly to spread her wings and fly to a better world and there enter into rest, and leave him alone in this rough world to battle with hunger and cold—with seven little maidens on his back? No wonder that his back began to bend; no wonder that his flesh fell away, and he looked thin and transparent; no wonder his clothes were so poor and patched. But his seven little girls were plump and upright and sturdy and neat. He stinted himself of everything that they might lack nothing. It was a desperate battle, and only strong love could have nerved him to fight it. If Richard Cable could have gone to sea, he might have earned something better than what he could pick up at St Kerian; but he had either taken a distaste to the sea since his last voyage, or he could not bring himself to leave his children any more.

He went about the parish to the farmers, limping on his stiff leg, and asked for work. Could he hedge? He had never learned the art, and let me tell the reader that hedging is an art, an art which School Boards are killing; it is an art to be acquired in boyhood, and there is hardly a young man nowadays who can hedge. Did he know anything about cattle? He had had no experience, and not a farmer would intrust his cattle to him, that he might acquire experience on them. Could he plough? He had never tried; and good ploughing is not easily acquired. A walking postman was needed for five parishes, the pay six-and-sixpence per week; the distance to be walked, fair weather or foul, twenty miles—but then, Richard was lame; so he refused the six-and-six.

The parish authorities, the whole neighbourhood—that is, all five parishes—took it ill that he rejected the office of walking postman so liberally offered him. That he was lame, was his concern, not theirs. He rejected the office because he was proud; he was puffed up with pride because he was a foreigner. What could be expected of a man who had seven little girls and not a boy? Seven little maids! What was to become of them if their father died? They and their grandmother would have to go to the workhouse; and who would have to pay for them there, for feeding, for fattening of

them, for clothing, and educating them? Who but the ratepayers? No wonder that, with such a prospect, the ratepayers looked on Richard Cable with a resentful eye.

He got work at last—work for the time being—he took it resentfully, surlily, with gall in his heart—work on the roads.

There was another matter which had not conduced to diffuse a kindly feeling towards Cable in the place. One day, a village boy had knocked little Mary down out of wanton wickedness. She was a foreigner. He had heard his parents, the entire parish, speak against these foreigners, and he thought himself at liberty to demonstrate his dislike by outward act. When Richard heard this, he was as one possessed. He went after the boy and half-killed him in his fury. He barely escaped a summons for this retaliation. The boy's father was a carpenter, and was related to every one else in the place. In St Kerian, if you touched one, the whole population came out against you as a hive of bees. That the boy had done what was wrong occurred to no one. An outrage had been committed by this lame foreigner on a member of the community, and the entire community took it up and resented it angrily.

Since Richard had crossed the threshold, not once had Josephine been named. One might have supposed that, as far as Richard was concerned, no such person existed.

Since he had entered that cottage, no allusion had been made by him or his mother to the fortune of Gabriel Gotham. They had but to make their necessities known, and they could have as much money as they needed. But Richard would have died, his mother would have died, one and other would have sat silent and watched the seven little girls die of starvation, rather than touch a penny of that fortune. They were proud, were these Cables, mother and son; their pride was inflexible as iron.

#### CHAPTER XXXIX.—A SPIKE IN THE NEST.

The mind of Mr Cornelius was at ease. So completely satisfied was he that nothing was to be apprehended which could annoy him, that he went to town 'on business,' as he told his sister and daughter; really, that he might amuse himself, and he remained away from Hanford over a fortnight.

When his affairs were in an unsatisfactory condition, and he saw that only desperate measures could avail, not to recover him, but to stave off a complete break-up, he had begun to draw towards his old associates and dupes. His conversation had acquired a sanctimonious savour, and the cut of his coat had something clerical about it. He laid aside his rather highly coloured ties, and adopted black. A moustache he had been cultivating disappeared. But when Josephine acquired the fortune of Gabriel Gotham, all necessity for picking up the old threads of his former life passed away, and he dropped once more the acquaintances, and the formalities and restraints he had with a bad grace reassumed under the cogeny of adverse circumstances. He was an exceedingly shrewd man, as shrewd as he was unprincipled; he knew the foibles, the follies, the weaknesses of men; but what he

did not know, and made no allowance for, were the noble and generous impulses of the heart. He traced all action in life to springs—but these springs were always mean and selfish; consequently, he was occasionally foiled in his calculations.

He did not understand his daughter's nature, because he was unable to understand that she could be actuated by any motives involving self-sacrifice. He respected her intelligence, and he relied on her wit saving her from doing anything injurious to her prospects. Her marriage with Cable had been a puzzle to him; but he supposed that it was due to an unreasoning passion for a time blinding her eyes to her interests. That she regretted her marriage, he had no doubt; that she no longer loved Richard, he was aware, and he was consequently well assured that she would take no steps to bring about a reconciliation, and a repetition of the ridiculous and disagreeable incidents of the past month, which must follow in the train of a reconciliation. As there are two hemispheres in the brain, and we can therefore simultaneously think of two matters at once—as, for instance, we can read aloud, and be meditating at the same time on something different; or we can converse with a visitor, and whilst so doing take an estimate of her dress, and note where the braid is off and a glove is burst—so are there double, and even more than double springs in every heart, and none can tell at once which is in the ascendant. There is always, and there always must be, an element of uncertainty in the determinations, and consequent actions, of every man, for this reason. We cannot tell at once which of the springs, even if we recognise their existence, is the strongest, and what the correcting and controlling force of the other that is acting in opposition. Indeed, it is not unusual that any one of the springs asserts itself as a mainspring till late on in life, and in no inconsiderable number of persons none ever does so assert itself.

Mr Cornellis regarded his fellow-men much as billiard-balls: he had only to walk round the table, level his cue, rest the end between his thumb and forefinger, and strike, calculating to a nicety the angle at which the balls would fly apart; the cannoning and pocketing would follow as a matter of course. All went by rule of dynamics. And Mr Cornellis would have been right had all his balls been perfectly round, and absolutely solid, and his table nicely levelled. But these were elements in the game that did not enter into his calculation.

It is said that the Englishman rushes into war thoroughly despising his enemy, and that this is the cause of the majority of the disasters which mark the initiation of a campaign. Mr Cornellis shared the Englishman's contempt for an enemy—that is, for every one with whom he had dealings. He undervalued his powers; he disbelieved in moral force, and consequently made no provision to counteract its effects. Stupidity he could allow for; and when he encountered strong principle, he misjudged it, and eschewed it as stupidity deeper than what he had allowed.

Mr Cornellis and the rector viewed the world of men from opposed points. The latter was surprised and troubled when he found that other

motives swayed men's conduct than truth and honour and love; and Mr Cornellis was perplexed and angry when he came across those who were not either intensely stupid or wholly self-seeking. Neither liked the other. Mr Seilwood was forced to mistrust Cornellis; but he never could persuade himself that Josephine's father was as devoid of principle as his clear common-sense obliged him to suspect.

When Mr Cornellis went to town 'on business,' he gave no address where he might be found; he did not desire to be worried by his sister's letters concerning the trivialities of Hanford life; consequently, his daughter was unable to communicate her intention to him till he was pleased to emerge from the seclusion in which he had kept himself and shrouded his acts whilst in town. When, after a visit to London that lasted somewhat over a fortnight, and had cost him a considerable sum of money, Mr Cornellis reappeared at Hanford, not much fagged with his business, in a completely new suit, in the latest fashion, from the best tailor, and with a new diamond pin in his tie, he was not in the smallest degree prepared for the surprise his daughter had in store for him.

Mr Cornellis had never taken pains to gain his daughter's affections; he was aware that he had not her esteem; there was always present between them an invisible barrier. When two intellects are set in opposition, and the male and elder is aware that the other is its match, there ensues a sense of injury and aversion. It breeds a contest, lest it should sustain a fall. Mr Cornellis had seen his daughter's mind and character form under his eye with an independence that annoyed him. He had not moulded them—they had shaped themselves. Where he had interfered, his interference had brought about results the opposite to what he designed. The chronic antagonism between them had not broken out into civil war till Josephine had declared her intention to her father of taking Richard as her husband. After one savage passage-of-arms, a truce ensued; the father knew he had gone too far, and he used all his arts to recover the lost ground. The marriage of Josephine had brought her closer to him than she had been in her previous life. She had been forced to acknowledge that he was right in his opposition, and to submit to his guidance. He had acquired an ascendancy that satisfied him, and he rashly supposed that this ascendancy was final and secure. Mr Cornellis had written to announce his return, and to order the carriage to meet him at the station. He was surprised to see Josephine on the platform ready to receive him, when he arrived from town by the train he had mentioned. This was an attention he had not anticipated. She was dressed very quietly in her blue serge, and with a close straw bonnet trimmed with navy-blue ribbons.

'Why—Josephine,' said he, taking her arm as he stepped out of the carriage, 'what new fad is this—dressing like a superior domestic?'

'I am glad you have arrived as appointed,' said she, without answering his question. 'Had you come by a later train, I might have missed you. I am going off by the next up-train.'

'Indeed? Whither?'

'Will you come with me into the ladies' waiting-room—there is no one there—or walk

with me on the platform, whilst I tell you what I have to say?'

'Well—be sharp. I want to get home, and cannot detain the horses.'

They walked together out of the station along the platform, where there was no one to overhear their conversation.

'You are looking well, papa. I hope you have enjoyed your visit to town?'

'I have been steeped to the ears in business,' he replied. 'I got into Kettner's occasionally, and had something really good to eat, neither over-salted nor under-spiced. When I am a little out of sorts, I run in there and have a bowl of *bisque*. It sets my stomach right when nothing else does—light and nourishing. I am fond of Kettner's, quiet—and good wines. The waiter there knows me, and is attentive.'

'Papa, I am going.'

'So you have told me; but I have not been informed whither.'

'I am going into Somersetshire—near Bath.'

'What for?'

She hesitated. She was a brave girl, but she shrank from the scene that must occur. The rector, aware that the interview would be unpleasant, had volunteered to relieve Josephine of the duty of telling her father what had been determined and done. But she had declined his offer, and had resolved—it must be admitted, with a spice of craft—to break the intelligence to her father almost in public and a minute before she departed. After that quarrel with him which had driven her desperate and made her plunge into the sea, she shrank from a private interview; and she knew that if he were told what she had decided on whilst she remained at Hanford, the house would be insupportable. Whatever he might say, he could not alter her mind. His absence had enabled her to dispose of everything, undisturbed; and now all that remained to be done was to inform him of arrangements already completed; and as soon as this was done and she were away, the better for both.

'For the life of me,' said Mr Cornellis, 'I cannot see why that precious idiot of a cook of ours should never make *bisque* to my fancy. No great difficulty in pounding prawns, I should have thought.—By the way, Josephine—artichoke soup with crushed almonds is worth living for.'

'Papa, I have something very important to tell you.—Never mind about soups now. I am afraid'—with a touch of her old self—'I am going to salt and flavour your soup not at all to your taste.'

'Go on with what you have to say; I am impatient to be on my way in the carriage.'

'My train will start in five minutes. I have my ticket, and my boxes are labelled. But I have only five minutes in which to tell you something that will surprise and, I fear, annoy you greatly.'

'Upon my word,' said Mr Cornellis irritably, 'you have the knack of making one uncomfortable. You treat me as the boys treat the plovers. When they have found a nest on the downs, they drive a spiked stick into the ground at the bottom, so that the poor bird cannot sit on her eggs comfortably, and she goes on laying

till she has heaped her eggs over the spike, so as to make her seat tolerable.—What new stake have you been driving into my home? My whole time and energies are taken up with covering the prickles and goads you fabricate to my torment.'

'You have been from home, papa, so it has not been possible for me to consult you since the rector returned from Cornwall.'

'What did he find there?'

'The yacht was wrecked; but Richard and the children and his mother are saved; the other poor fellows are lost.'

'Things might have been managed better,' growled Mr Cornellis.

'Poor Richard has injured his thigh, and is likely to be lamed for life.'

'If he be tied by the leg to the Cornish rocks, so much the better.—Are you going as the eagle to tear the entrails of your Prometheus?'

'Papa, I have been considering about Cousin Gabriel's legacy. You let me accept it; you let me marry Richard without telling me who Richard was. I have learned that now; and I know that Cousin Gabriel performed an act of gross injustice in not recognising his son and leaving his estate to him.'

'That was Gotham's concern.'

'I have inherited what ought to belong to Richard. I have considered the situation, and I have resolved not to take the legacy.'

'You have taken it.'

'I am going to—no, to be correct—I have already—surrendered it.'

'I do not understand you.'

'I have no right to the estate. When the rector went to Cornwall, I told him to offer it to Richard. You know, papa, that Cousin Gabriel left everything in trust till I married, and that at marriage I became sole possessor, with entire liberty to do what I liked with the property. I was so sure, when I came to consider matters, that Cousin Gabriel meant the estate to pass to his son, through me, that I could in conscience do no other than transfer it to Richard. I have striven to do what is right, and I have made the transfer.'

'You do not mean'—Mr Cornellis could not finish the sentence; he had turned the colour of a Jerusalem artichoke.

'I do indeed mean what I say, papa. I have been with the lawyer, and Mr Sellwood has helped me, and it is all done. The difficulty we have had to contend with is, that Richard absolutely refuses to accept what I offer. I did not think myself justified in retaining any share, and I wanted to make over every penny unreservedly to Richard; but Mr Sellwood and the solicitor have advised me otherwise, and I have retained an annuity of two hundred and fifty pounds for my separate use as long as I live.—But, papa, I had already made up my mind to touch nothing of Cousin Gotham's money—so long as I do not share it with Richard, I mean—till I can receive it from him. So I will not have this annuity for my own self; I give it to you. You shall enjoy that; and, unless Richard objects, which is not likely, you can live at the Hall.'

'On two hundred and fifty!'

'Of course the place must be kept up, and

the maintenance of the house and estate will be paid out of the estate. I do not see why you should not continue to live at the Hall; you will have the two hundred and fifty in addition to your own private income, and have the house and garden rent free.

He turned his face towards her and opened his mouth to speak. The face was livid and quivering with evil passion. Every veil of disguise had fallen; the ugly villainy of the man's soul glared at her out of his eyes. She shuddered. He looked, with his mouth open, as if he could have flown at her and bitten her. He could not speak; he was too greatly agitated to utter a word.

'Shall we turn back towards the station?' continued Josephine. 'I see it is time for me to be getting into my carriage. I have not much more to say. If I have forgotten anything, Mr Sellwood will supply the deficiency.—Richard is angry with me, and he has cause to be angry. I shall never rest till he forgives me and takes me to his heart again. I have been unworthy of him. I was not well advised; but my own heart was rebellious. I have been proud, and now I am going into the world to learn humility.—Papa, Mr Sellwood will explain to you the course I have elected. I have told Aunt Judith; but she cannot understand. I intend to earn my own livelihood, and earn Richard's respect.—There—the bell is ringing; I really must be off. I have taken a third-class ticket.—Let my arm go, papa. Say good-bye; we shall not meet again for some time. If I have been unlike a daughter to you and failed in love—I ask your pardon. I fear—I fear that I have driven a spike into the nest that wounds you.'

'That impales me,' groaned Mr Cornelia.

### WHAT IS A DAY?

A SIMPLE question enough, and one that admits of various simple answers, each correct as far as it goes. In one sense in which it is commonly used, 'day' indicates the period of light as distinguished from that of darkness, denoting, therefore, any length of time under six months, according to the latitude of the observer and the season of the year. Another popular meaning is the space of twenty-four hours, including a period of light and another of darkness. This, again, is not the same all the world over, as the times of its commencement and termination vary in different countries, some reckoning from evening to evening, others from morning to morning, while modern civilised nations count from midnight to midnight. Astronomers, also, have their various days: the absolute solar day, ranging from about half a minute under, to the same amount over twenty-four hours at different times of the year; the mean solar day, being our common day of twenty-four hours; the lunar day, of nearly twenty-five hours; and the sidereal day, of about four seconds short of twenty-four hours.

These different answers, and the phenomena to which reference must be had for their explanation, would provide material for a long article.

But there is another aspect of the question which is not less interesting, though not so frequently alluded to: we refer to the duration of each day on the surface of the earth, the place and time at which it is first seen, and at which it finally disappears.

The succession of day and night depends on the rotation of the earth on its axis; and since the earth is of a globular shape, it is evident that the whole of its surface cannot be turned towards the sun at one and the same moment; in other words, that it cannot be noon all over the earth at once. A little thought will show that whenever it is noon at any one place, it is midnight on the opposite side of the earth; and at the different places between, all the times of day are at one and the same moment to be found. Take a particular example to make this clearer. When it is noon at London, the countries exactly on the opposite side of the earth—say New Zealand and its neighbourhood—are turned directly away from the sun, and therefore have midnight. Paris, being a little farther east than London, will have been brought directly under the sun a little earlier; that is to say, at London noon, Paris noon has been gone a few minutes. Go to Egypt and Constantinople, farther east; their noon has been gone an hour or two. Farther on, again, India is approaching her eventide, and China and Japan have already sunk into darkness. Turn your face west, however, across the Atlantic: you will find our American cousins have not yet reached their mid-day, in fact are thinking in New York about breakfast, and out west in California are hardly yet getting up. Still to the west, we come round again to New Zealand, where the day—which was only just dawning in California—which was high noon at London, and afternoon in India—this same day, say the 1st of July, is, as we saw, on the eve of departing altogether, to give place to a new one, the 2d of July. It is clear, then, that, while the 1st is still young in America, and long before it is over even in England, the 2d will be well started in New Zealand and countries in that longitude, and will come round the world from east to west as all its predecessors have done.

The question then arises: where did this day, the 2d of July, first begin? It was not in America, for we saw the folks there just about to rise on the 1st. Yet it was beginning in New Zealand. Therefore, it must be either in New Zealand or some place between there and America. The fact is that there is no defined place where the day can be said to appear first of all. Civilisation originally spread from east to west across the Old World, and then across the New, carrying its calendar with it. The day came from the east, and travelled across to the west, and no one asked whence it originally came or where it ultimately died. Thus, the common usage, treating the day as appearing first in the Old World and then proceeding to the New, left no place for the new day's birth except the wide Pacific Ocean; and

when traffic began to cross that ocean, and the question was forced upon men's minds in a manner which we shall soon see, a sort of understanding was arrived at that the day should be deemed to begin there.

According to the way in which this arrangement is now carried out, the first *land* that the new day dawns upon is Easter Island, about two hundred and thirty miles west of the coast of Chili, South America. That is to say, the 2d of July breaks here within a few hours of the 1st having broken on the American coast to the east, and the two days run on alongside—the 2d in Easter Island and places west, the 1st in all places on the American continent. We may therefore realise this idea—that at twenty minutes past seven any morning of our lives in Great Britain, the next day is commencing on the world, and is to be found at this little island in the Pacific Ocean, whence in due course it will travel round to us. But to have thus the start of the world is not an unmitigated advantage to these islanders. Suppose one of them sails east to America, what is the result? He will find they keep the day there under a different date, and he will have to reckon one day in his calendar twice over to put himself right with their notions. On the other hand, if an American crosses from east to west this wonderful magic line where the day begins, he will find the dates in this fresh part of the world are one in advance of him, and he must needs strike a day out of his calendar to keep up with the times. This fact was curiously illustrated in the case of Magellan, the Portuguese captain, who sailed round the world from east to west in 1522, and having crossed the magic line of 'day's birth' in his wanderings, his calendar became of course a day in arrear. The sailors were completely ignorant of this, and finding, on landing at home, that their Sabbath was falling on a Monday, they accused one another of tampering with the reckoning. It was not for some time that the true explanation was discovered. The converse case is made the hinge of the plot in Jules Verne's *Round the World in Eighty Days*, where the author depicts an eccentric Englishman, Phileas Fogg, who made a wager that he would go round the world in eighty days. He accomplished his feat in what he thought was eighty-one days; but on arriving in London, found his friends anxiously expecting him, and discovered he had just won his wager. He had crossed the magic line eastwards, and had forgotten to subtract the day he had thus gained.

To put the matter another way. In sailing round the world eastwards, the days are each a little less than twenty-four hours, according to the speed of the ship, as the sun is met every morning a little earlier. These little differences added together will amount in the course of the circumnavigation to twenty-four hours, giving the sailors an extra day, not in imagination, but in sober truth, as they will have actually eaten an extra day's food and consumed an extra day's grog. On the other hand, in sailing westward, the sun is overtaken a little each day, and so each day is rather longer than twenty-four hours, and clocks and watches are found to be too fast. This also will amount, in sailing round to the starting-point again, to one whole day, by which the reckoning has fallen in arrear. The eastern

ship, then, has gained a day, and the western ship has lost one, leading to this apparent paradox, that the former ship has a clear gain of two whole days over the latter, supposing them to have started and returned together.

Colonies and settlements have occasionally had strange experiences in this matter of dates. Great nations have a tendency to make all their possessions follow the institutions of the mother-country as far as possible, and with respect to the calendar this rule holds good. It is indeed the reason why most of the islands of the Pacific keep Asiatic dates, although some of them are much nearer the American than the Asiatic coasts; the fact being that these islands were discovered and settled by mariners sailing from Asia, who of course took their calendar with them and never thought of altering it. The system, however, of carrying a foreigner's reckoning into another country has not always worked so successfully. A few years ago, Alaska—the north-west corner of America—having been settled from Russia and being owned by Russia, kept its calendar as it had been brought round from the west by Russians; on the other hand, the rest of America kept the date which had come round to them with the discoverers from the east, which was of course a day behind the former; so here were two different dates close at hand. When Alaska was ceded by treaty to the United States in 1867, the inconvenience of continuing this was evident, and the Alaskan calendar was forthwith summarily altered to agree with that of the United States. Hence, although this portion of the continent stretches out far to the west of Easter Island and other places where eastern time is reckoned, yet, to bring it into conformity with its present rulers, it has to keep a full, twenty-four hours behind these places in its reckoning of days.

More curious and anomalous even than this is the case of the Philippine Islands; for, although these lie so near to the Asiatic coast, it was by Spaniards who sailed eastwards from America that they were settled. Did they revise their calendar when they crossed the magic line, and strike out a day, to keep themselves abreast of the times? No such thing: the Spanish Dons of that day were a proud and fiery folk, and if their calendar did not agree with the times, then so much the worse for the times. Anyhow, the fact remains that, when they arrived at the Manila or Philippine Islands, they still reckoned by the calendar which had been taken from Spain to America, and from America by them on their voyage. They were, of course, a day in arrear; but as there were not then any important settlements of civilised nations thereabouts with whom the date could be compared, the error was not noticed; the reckoning took firm hold, and in consequence, the inhabitants of Manila keep plodding along one day behind all their immediate neighbours.

Even so far as British settlements are concerned, it is in many cases by pure accident, and not by preconceived design, that their calendar is kept in accordance with the general rule. For example, the first settlers of Botany Bay—the place where for many years involuntary emigrants from this country found free quarters—went out in 1788 under orders to sail round Cape Horn westwards to their destination. Stress of weather, however,

forced them eastwards round the Cape of Good Hope, and so they reached Australia with eastern date, which of course they ought to keep; whereas, if they had followed their orders and proceeded by Cape Horn, they might easily have fallen into the same error as the Philippine islanders. A few years later, a missionary expedition to the South Sea Islands met with a similar accident, and so took eastern date with them, thus falling in with the recognised rule. The French, however—according to a writer in *Notes and Queries* in 1853—sent an expedition in the early part of this century westwards to Tahiti, who took their own date with them, and, in accordance with the emulative spirit which runs so high between Frenchmen and Englishmen, refused to conform to the calendar they found then in use on the islands, and kept their own, holding their Sabbaths and festivals the day following those of the English residents. The writer from whom we quote does not explain the ultimate result of the matter.

By way of showing in a practical manner what a day is according to the view we set before ourselves, let us suppose it agreed that bells should be rung all over the world for the whole day on some particular anniversary—say, Christmas Day. This chime, then, would first be heard at Easter Island, and that at twenty minutes past seven by our Greenwich time in the morning of the 24th December. After the ringing had been going on there for three hours, the bells of the Sandwich Islands would join in chorus. Two hours later we should hear those of New Zealand and the Fiji Islands. Rather more than another two hours later, and Adelaide and Japan would 'salute the happy morn' with their tintinnabulations. But while all the rest of Polynesia and Australasia was thus vocal with melody, an ominous sullen silence would reign in the Philippine Islands, to which no 'Babe in Bethlehem born' would be heralded for full twenty-four hours yet. Disregarding these belated Spaniards, the music reaches the Asiatic continent: Bombay takes up the tale four hours after Adelaide; St Petersburg, four hours after Bombay; and our own 'Bow Bells' would peal forth two hours after St Petersburg—that is, sixteen hours and forty minutes after the first clang at Easter Island. The Azore Islands would commence their ringing last of all European bells, being a full hour and a half later than London. New York would follow five hours after us; and Denver City, on the 'Great Divide,' about two hours after New York—that is to say, just about the time when the bells of Easter Island, having rung through their twenty-four hours, would be stopping. Alaska, still farther west on the continent of America, steps forward three hours after Easter Island has finished; and finally, the Philippine islanders commence to wake the echoes when all their neighbours are sinking into silence, five hours after Alaska has begun, and about eight hours after the last note on Easter Island. It is now about four o'clock in the afternoon of the 25th with us, and as the Philippine bells have still their twenty-four hours to ring, Christmas Day, which began at twenty minutes past seven in the morning of the 24th, will not be over till four in the afternoon of the 26th.

Thus, to the various definitions of a day which we hinted at in our opening remarks, we may add

this, that, considered with reference to its first appearance on the earth and its final departure from it, a day is a period of about fifty-six hours and forty minutes.

## WYTHRED'S WHARF: A THAMES-SIDE TALE.

IN FOUR CHAPTERS.

CHAPTER I.—MYSTERY.

BETWEEN Thames Street and the river Thames, upon a spot on which the castle of an English monarch once stood, there stands a lofty warehouse; so lofty, that even at mid-day it throws some shadow upon the broad wharf below, where steamboats and lighters and other craft are closely moored. It is a busy scene; for upon that 'silent highway,' where formerly the gilded barges of royalty glided to and fro with cargoes of dames and courtiers, black barges now pass in slow procession, led by asthmatic tugs of the most democratic appearance. Here laughter seldom greets the ear; the hoarse shouts are heard of barges and lightermen, and the constant trundling of iron trucks loaded with boxes, sacks, or bales; but above all other noise sounds the rattling chain-work of huge cranes when the goods are lifted into the air and swallowed up at some wide aperture upon one of the numerous floors of the warehouse—a warehouse which would seem to boast of unlimited accommodation; for the unloading from the lighters and the lifting of merchandise into one storeroom or another go on day after day from dawn until dusk.

Upon the first floor of this warehouse, looking out upon the river, is Mr Lintock's office. Mr Lintock is the proprietor. Wythred's wharf and warehouse have been in the family for generations. Few richer men are to be found than John Lintock in the city of London; and yet, as he sat late one afternoon at his desk, this princely wharf-owner had a discontented, troubled look. His forehead was deeply wrinkled, and the expression in his eyes was that of a man who was constantly haunted by some distressful thought. A knock at his office door, for no obvious reason, startled him. It was growing dusky on the river, and the men were beginning to disperse for the night. It was duskier still in the wharf-owner's room.

'Who's that?' Mr Lintock, half-rising from his chair, shaded his eyes with his hand.—'Ducket? Ah, that's right.—Well, Ducket,' said he, when the man had closed the door, 'what is it?'

Looking round the sombre room, Ducket said: 'Shall I light your lamp, sir?'

'No, Ducket. I shall not need it to-night. I am going home.—Have you anything to say?'

Ducket was Mr Lintock's foreman. He was a broad-shouldered man, with large limbs and a great honest face. His figure was angular—a gaunt form, aggravated in its stoop by constantly bending to lift heavy weights. He had the keen, searching eyes of one long accustomed to the supervision of a hive of workmen.

'You wished me to tell you, sir, when I saw Clogstoun again.'

'Well?' said Mr Lintock, noticing some hesitation.

'I have seen him.'

'About the wharf?'

'No; he has given up coming here. He took the hint I gave him last time, and has kept away; though I never thought that he would.'

'Where, then,' said Mr Lintock, 'did you see him?'

'On London Bridge. He was lounging there, sir—leaning over the parapet. It was getting dark, as it might be now; and I saw him look at the warehouse and then down into the river, as if he had half a mind to drown himself. I'm a-thinking, sir,' added Ducket, 'that he's getting a bit daft.'

The wharf-owner answered thoughtfully: 'A danger to himself.'

'And to others, sir,' said the foreman significantly. 'He's plotting. A man like Clogstoun would stick at nothing.'

'What do you mean, Ducket, by that?'

Ducket twisted his cap in his hand and glanced out of the window upon the darkening river. 'Plotting revenge,' said he.

'Eh?'

'Plotting revenge,' repeated Ducket, with a quick look at his master. 'Why, these broken-down, drunken chaps like Clogstoun, sir, have nothing to lose—they set no value on life.'

'Do you mean their own?'

'Ay, sir; neither their own nor other people's. You'll excuse me, sir; but if you had seen his face'—The foreman stopped abruptly. Something in Mr Lintock's face alarmed him: a keen stab could scarcely have produced a more sudden change. But the startled expression passed before he could even inquire if his master was ill.

'Ducket,' said Mr Lintock, rising from his chair, 'if Clogstoun ever comes to the wharf, either by Thames Street or the river, you have my leave to hand him over to the police. We must run no risks in a place like this.—I am glad to see,' added the wharf-owner approvingly, 'that you are alive to the fact that the man is a dangerous character.'

As he drove that evening towards London Bridge Station through the lamplit streets, Mr Lintock peered restlessly out of the carriage window; and in the large thoroughfares, where men with uncouth, dissipated faces laughed and talked at half-open tavern doors, he looked about him with the horror of one who dreaded to recognise some repulsive face among them. It was not until the wharf-owner had passed into the crowded station that he seemed to throw off in some degree this strange curiosity in his unfortunate fellow-men.

Mr Lintock lived at Greenwich, and the train was on the point of starting. As he stepped into an unoccupied compartment and the porter was closing the door, a young man came up out of breath and stepped in after him. By the dim lamp overhead they recognised each other as friends, and a warm greeting took place between them.

'Why, Overbeck,' said the wharf-owner, 'what takes you to Greenwich?'

'I was coming down to pay you a visit.'

'To dine with us?—I am delighted to hear it.'

A matter of business between Mr Lintock and Percy Overbeck had originally brought them together. Overbeck had taken part of a house

in Trinity Square as junior partner in a Hamburg firm, and often had occasion to land goods at Wythred's wharf. The wharf-owner, in his younger days, had known Overbeck's parents; and he had welcomed to a place at his hearth this son of his old friends, as soon as he presented his 'letter of recommendation;' and so it came to pass that the young Hamburg merchant quickly learnt to realise that Mr Lintock had a fascinating daughter. Nor did he despair of some day winning Bertha Lintock's hand.

The train was in rapid motion. The two friends, seated opposite to each other, were chatting pleasantly, when a startling change came over Mr Lintock's face. The expression was that of abject terror. With his eyes fixed as though he were fascinated—fixed upon the further window of the carriage—the wharf-owner sat pale and speechless. Overbeck could not withdraw his gaze; and so completely did Mr Lintock's altered face and attitude impress him, that for the moment he imagined something supernatural had appeared to him. Turning his head to follow the direction of the wharf-owner's eyes, Overbeck was surprised to see no phantom—nothing visible beyond the window but black night.

Overbeck placed his hand upon Mr Lintock's arm. 'Are we in danger? You stare as though you anticipated something terrible. If there is any'—

The wharf-owner raised his right hand to silence his companion, at the same time covering his eyes with his other, as if to shut out some repulsive sight. 'There is no danger'—he spoke in a strange agitated voice—'no danger now. It is past.'

This answer, in Overbeck's excited state of mind, did not satisfy him. 'There was danger, then? If it was real, and not mere fancy'—

'It was real. It's lucky we met to-night. Your presence has saved my life.'

'In what possible way?'

'Do not question me now,' said Mr Lintock with great earnestness. 'I saw, as distinctly as I see you at this moment, a face at that further window'—and he pointed towards it as he spoke—'a face that has haunted me for more than a year past.'

Overbeck sprang up to go to the carriage door; but the wharf-owner placed a restraining hand upon his shoulder. 'Don't stir! The face has gone. It would be madness'—

The engine shrieked, and the carriages began to slacken pace. In another minute the train had come to a standstill in Greenwich Station.

## THE STARLING.

THE starling is one of our most interesting birds, a bright, active, and exceedingly handsome little fellow. His well-known powers of mimicry are admirable and amusing. He is also an inoffensive bird; nay, more—he is very useful. His principal food consists of worms, insects, and larvæ of all sorts, chiefly the last-named; and the vast quantities of grub he consumes both on his own account and on that of his brood should insure for him protection and encouragement. Unlike the blackbird and thrush, he does not seem to attack fruit of any kind; at least we

have never observed that he does, and gardeners have, therefore, no cause to quarrel with him. Nor is he in the least injurious to grain. It is an open question whether the rook, to which the starling is nearly allied, is entitled to be regarded as not, on the whole, more hurtful than helpful to the farmer. That he destroys vast quantities of grub is certain; and in this respect it is clear he is a good friend of the farmer, although the benefit is not very apparent, nor can it well be estimated in pounds, shillings, and pence. But, on the other hand, he often proves very destructive to the potato crop in all its stages and to newly thinned fields of turnips. On the latter, the rooks will sometimes descend in a flock, and in an hour or two of a morning pull up thousands of young plants, merely, as would appear, on the chance of finding a worm or grub at the roots, for the turnip plants are not eaten by them. But no such charges as these can be brought against the starling.

We are aware that some persons have attempted to blacken his character by affirming that he destroys great numbers of the eggs of smaller birds, especially those of the lark; and a year or so ago, there were those who maintained that starlings if allowed to multiply would very soon extirpate the larks. We do not deny that master starling sometimes appropriates a few eggs of smaller birds, to which he has no legitimate claim. But eggs are not his proper or usual food, and at that season of the year when the small birds are incubating there is abundance of his usual fare to be had, so that he has no need to seek a meal by robbery of the sort charged. The presumption is, therefore, against what we must call the libel. But more than this; we think it is sufficient to rebut the charge of his maligners to state the fact that in the Orkney and Shetland Islands, with which we are intimately acquainted, starlings, larks, mountain linnets, and many other species of small birds, are exceedingly numerous. The lark and the mountain linnet build their nests on the ground in the most open and accessible places, and if the starling were a robber of their nests, there would not be such immense numbers of these charming songsters in those islands. Go where one may in spring and summer, he never but hears the inexpressible sweet songs of half a dozen of these 'ethereal minstrels;' and the clouds of linnets which congregate together after the breeding season and fill the air with their joyous melody, prove plainly enough that they do not suffer much, if at all, from starling persecution and depredation.

Until within the last twenty or thirty years, the starling was a comparatively rare bird in the inland districts of Scotland; but of late, from what cause is not clear, the bird has been increasing rapidly. He is not often seen during winter in such localities, for at that season he can get but little of his proper food; but considerable numbers now come inland as the breeding season approaches, and remain until the scarcity of provisions compels them to seek the milder districts of the sea-coast, where they can always pick up a living.

Our house is situated about twenty miles inland from the shores of the Firth of Forth, and for the last twelve years we have been greatly interested

in watching the proceedings of a pair of starlings which come here every year to bring out their young. We do not know for certain whether it is the same identical pair. Sometimes, from the repetition of their little ways and tricks of action, we think so; at other times, we are doubtful. But what is curious is, that there is but one pair about the premises, and they always take up the same safe and comfortable quarters. There is a hole in the wood under the eaves of the projecting roof of the house just large enough to allow ingress and egress. Somewhere inside, but close to this hole, the nest was originally built, and continues to be built, or rather, we should suppose, repaired, every year, when the same routine and formalities are gone through. On a fine day about the end of January, one bird arrives. We hear from above, his cheerful but not melodious notes, the exact counterpart of the pipe of the golden plover, the whistle of the curlew, or the scream of the seagull; and looking up, see our old starling friend perched on the top of a chimney-can, prospecting. He remains one or two days, and then disappears. In a fortnight or three weeks, according as the weather may happen to be good or bad, he returns—this time, with a mate. This visit commonly lasts for three or four days; and the pair carefully inspect their old quarters and again take their departure. Not till further on in spring do they come and commence the important business of the season.

Most of the arrangements and preparation of the nest seem to be made in the early morning. During incubation, they are exceedingly quiet, and are seldom seen abroad. But as soon as the young birds are hatched, the life of the parent birds becomes one of ceaseless and evidently delightful activity. From 'early morn to dewy eve' they are busy catering for their young, and the quantity of food that is consumed is something to marvel at. Both birds are equally active; alternately they come and go, and exactly the same forms are gone through. Bearing a writhing worm or grub in its bill, one of the parents—there is scarcely any perceptible difference in the plumage of the sexes—alights on the corner of the roof, and intimates to the eagerly expectant brood, in loud, husky, but decidedly cheerful and encouraging screeches, that it is at hand with savoury food such as they love; and the intimation is received with a chorus of clamorous welcome from the throats of the hungry young ones. A glance over the eaves, a leap downwards, a flash and little flutter of the wings, and she disappears into the hole, almost immediately emerging again and flying off on a new quest. By this time the other parent bird has arrived with a contribution. And so, backwards and forwards alternately all day and every day, on parental cares intent, the pair continue their labours until the young birds are fully fledged—ready for flight, and to start life on their own account. We do not know when or how the grand essay is first made, for we have never been fortunate enough to witness it. We cannot say what arguments, persuasions, or gentle force may be used—or if the young birds of their own free-will go forth into the world when they feel competent for an independent career. But evidently they take their final farewell of their snug

quarters early in the morning before the human inhabitants of the house are astir. We have never seen any of the young birds after they have taken wing; they disappear from the neighbourhood with the parent birds; and then for a little while there is a cessation of activity on the part of the latter; or, more probably, they are teaching and helping their young ones to make a living for themselves. But in a week or two, our old friends are back again, and set about the work of rearing another family—for they bring out two broods in the year—and the same proceedings are gone through. With the departure of this second brood—rather early in autumn—the parent birds disappear for the season, and we see no more of them until the end of the following January.

This has been the routine of the last twelve years; and it seems strange that none of the young birds return to the place, or at least neighbourhood, where they were hatched, as is the case with so many other species of birds. But certain it is there is not another pair near the house, although there is abundance of excellent accommodation for any number of them, and never more than our two old friends are seen on that most favourite of all perches, in the estimation of starlings, the chimney top.

### DOWN WITH THE DIVER.

‘HAVE I been at it long, did you say, sir?—Well, a matter of fifteen years or so, and that ought to give a man a bit of experience.—Yes; I like the life—there’s plenty of variety; the profession ain’t overcrowded; and then you see, sir, you’re quite your own master, once you’re down under water, and can just get on with your work comfortable, with no boss coming prying around to see how you be getting on—not that he could see much if he did come—

‘Not see, you say! Ha, ha! I see you’ve been reading one of them fancy tales in which a diver is supposed to tell how he has gone into the saloon of some sunk ship and found it full of corpses of drowned folk, all as if they were making a great rush for the deck; and how they stare at him with their awful eyes, and all look as though they were shrieking at him. And he feels awful himself down there with more than twenty fathom of water atop of him. All my eye, sir! You get down, you’ll find it’s a precious little daylight as is there—it’s more like the fogs as you get in London. So you can tell the gentlemen that write these yarns as they sit in their offices, if they want to tell how it looks below, they can look out of their windows some November afternoon.

‘Then, bless you, the depth to which the story-divers get is amazing, wonderful, and I may say appalling. There are divers who say they have worked comfortably at seventeen and eighteen fathom; but I’ve never met one of them. Mind, I don’t say it can’t be done—only, ten to twelve is enough for me, that’s all.—O yes; I know that some one has invented a dress and gear for thirty fathom, and a lamp with electricity in it;

but I’ve never seen either one or t’other. And I’ve heard tell that some makers have got telephones rigged to their helmets and spliced alongside the air-tube, so as the diver can sing out what he wants up aloft; and very convenient they’ll be, and a deal safer than signals. Now, when I want less air, I give a pull on the tube; and when I need more pumping, I pull four times. Likewise, I pull once on the line which is round my waist, if I am all right; and four times when I’m coming up.

‘Ay, ay; some of us have queer goes at times and no mistake.—You’d like to hear one or two? Very well, sir; here goes, then.’

And my friend Rose, who was at once skipper as well as diver, having pulled vigorously for a few moments at his pet brier and got it well alight, seated himself on the weather bulwarks of the *Albatross*, as that smart cutter lifted gently to the send of the tide, which was swirling past the white cliffs of Flamborough, and sobbing eerily in their weird caverns and crannies, and, to the musical piping of an August breeze in the rigging, began.

‘See Fife Brig thereaway on the port quarter, where a line of white surfs is breaking?—Well, there ain’t a more uncharitable place on this coast in real surly weather. It’s maybe ten years and more since an Italian schooner struck on the end one wild winter evening and drowned her hands, all except one young fellow; and he told how, when she rolled over, he’d seen the faces of the skipper and his wife and baby at the battened-down skylight. These Italians ain’t like us—they have to have no Board o’ Trade certificates; and so the skipper needn’t know nothing about seamanship nor navigation. This poor chap was one of that sort. He was the son of a rich shipowner out there, and was sailing the schooner, like, for fun. Well, his father wanted the corpses very particular—something about some property, we heard tell; and he wrote to my gov’nor to know as if he’d take the job. We weren’t particular about it, for it was winter and baddish weather; and a four months’ wreck in a strong tideway, and deepish water. However, to oblige the poor old man, we agree to try. So much pay for trying, and so much more for each body. Well, we got as close on to the spot as we could reckon; and in a day or two a smooth comes, and down I go, and see close aside me the identical schooner lying nearly on an even keel. I feel my way aft, and find the cabin skylight, and soon knock it right off, when up shoot the corpses like bladders through the water; and the hands aloft got them alongside and into two coffins as we’d taken on chance. It was not a pleasant sight.

‘Working in a tideway is tedious work, and I’ve seen when I’ve been down in the Humber, I’ve had to hold on with my left hand whilst I’ve worked with t’other, because the stream took me clean off my legs. Speaking of Humber reminds me of a queer sight I saw there a year or so back. A wheat-ship had gone down; but all hands were saved excepting the skipper’s wife and baby, as had somehow got lost sight of. My mate was down getting off the hatches, so as to get at the cargo. Suddenly, he signals as he is coming up, and we begin to haul in, and I go to the side to help him over, and there see the little drowned

bairn coming up slowly, just for all the world as if it were lying asleep in the water, for Tom was holding it up over his head, and I could not see aught of him till his hand came up. The father was aboard of us, and took and kissed that bit of a baby like mad; but we never found the woman—she likely went out to sea wi' the ebb.

'My poor mate was himself killed not three days after at that very wreck. You see, sir, as we move about, the air-tube and line follow us, and we have to be careful always to come back the same road as we go, because, you see, if you chance to pass anything on the way, such as a stanchion, or go round a mast or under a companion-ladder and come back t'other side of it, the tube and line kink round it and bring you up all standing, and you have to go back and follow your tube the way you come. Sometimes, if you have been down a goodish while and moving about a lot, you get mixed up, and forget your bearings, and are in a pretty fix. Why, once I remember I was over an hour following my tube like a puzzle before I could find my way up out of the engine-room in which I was working. If it happen that a man can't no ways free himself and it's all touch-and-go with him, if he's only got a clear way above him he has one last chance—and a desperate one it is. He knocks off his chest and back weights, shuts the escape-valves which let out the used-up air in his helmet, gets himself as full of air as ever he can, then cuts the tube above him, when, if he has luck, he tears clear and shoots up through the water. Of course, it's a risky chance; and to prevent too quick a rush up, you have to fasten your waist-line to somewhere below, and hold on to it going up. Well, Tom got fouled somehow, and decided upon cutting his tube, so he signals for more air; and away the pumps go, till suddenly there is a rush of bubbles through the water, and the same instant we feel a blow under this very cutter's counter. "Goodness me, that's Tom!" I cried. We got hold of him as quick as lightning, and had him on deck and his helmet off in no time; but he was as dead as a herring. An hour or two afterwards, a great blue line showed all round his chest and shoulders just where the helmet sits; and the doctor said he must have hit full tilt with his head, and the blow drove the helmet with such force as it crushed all his lungs and things in his chest. He had forgotten to fix his waist-rope, poor chap, and so could not stop his way shooting up.

'No, sir; I've never had to cut my tube. I've always managed to loose myself somehow, though once I got caught, and thought it was all up a tree with me; though by the same token it was all down a well. It happened at Bradford, in the West Riding of Yorkshire. There was some row on about water-supplies. I forget now the rights on it; but the owners of a well and spring had an idea that their water was being drawn off by some one else, so I was sent for to go and see. We got the pumps rigged; and I got dressed and went down the well, which was an old one, with a tunnel leading from the bottom of it, which I had to examine. It was about a yard high, and of course pitch-dark, and I had to creep on hands and knees; but in I get, and

crawl on for maybe twelve yards, when suddenly I feel a great jerk on my tube. "Hullo, what's up?" thinks I, and I gets hold of the line to signal as how I am all right, and they can keep on paying-out, when, to my amazement, the line is quite taut, and I cannot pull it an inch. Then I begin to feel queerish, and crawl back to 'the well-shaft; but I haven't got above five yards, when I run right up against something; and putting out my hand, I turn all sick in a minute, and think I'm a dead man, for a great heap of bricks and rubbish is filling up the tunnel, which has fallen from the roof. I tell you, it often makes me shudder when I think of it now even.

'Knowing I was caught like a rat in a drain, was awful, and I lay there too stupid to do anything. Luckily, the tube was uninjured, and the air came down all right to me; but I could not signal nor nothing, and I should lie there till I got stupid and suffocated; and thinking of that, roused me to make a big try for escape. Carefully I set to, and began to remove brick after brick; but it was awful work, for I had to push each one past me, and my heart was in my mouth the whole time, lest the movement of my arms and legs in the water should wash more of the old lining down, and bring the whole roof above on to me; and I had to mind, too, that I didn't let any of the rubbish that was down cave in and crush the air-tube. Often I felt so bad that I was for giving in; but somehow I always was brought up by thinking of my sweetheart, for I was courting then, and I thought as how I'd like to see her bonnie face again. So I goes at it; and I guess I prayed pretty hard as I'd get out alive. Well, I get at last the hole pretty clear, and after resting a bit, crawl carefully on, expecting every minute a fall of earth to pin me and crush the breath out of my body. But I reach the end at last, and scramble out into the well; and I was that weak and trembling, that it was some time before I could go up the ladder; and then I lay on the ground, when they got the helmet off, afore I could speak.—No more of that well for me, sir, though they offered me something very handsome to go down again.

'I had another nasty half-hour once in the West Indies, where we were at a wreck. She was a large steamer, that had struck on a reef and then slipped off into deep water, taking down the mails and a valuable cargo with her, though, luckily, passengers and hands were all saved. There were some papers as were particularly wanted, and I was in the chart-room under the bridge looking for them, when suddenly as I turned I saw the wicked snout of a big shark close to me. Nice fix for any one with delicate sort of nerves to be in, pinned up in a corner of a little square room and a big brute between you and the door—eh, sir? I went creepy all over, I can tell you; but I kept still, and so did he, merely working a fin lazily, like a screw steamer holding on against a tide. I got my knife, which we carry screwed in our belt, loose, and made up my mind I'd make a fight for it, if my gentleman began any little game. So there we were.—Sharks as a rule will keep clear of a diver; they don't seem to like his looks, and a helmet don't make a man

look pleasing. The risk is, they may bite the tube clean through, and that's a settler for the man.—At last, I stare him out of countenance, I suppose; leastways, he slews himself round, and I see him drift towards the far side; and so I begin to sidle for the door. As soon as I begin to move, he gets uneasy—maybe my tube touched him, or the air-bubbles frightened him; anyhow, he makes a rush for the door, and I respectfully make way for the flourishes of his tail; but when he was off, I was off up too, sharp.

'Well, I could be spinning yarns all day; but the tide is about dead-low now; so, if you like to don the gear, we'll put you over the side, and you can see how it feels under water, and get an idea how you'd like to be a diver—"A-walking alone in the depths of the sea," as I once heard a gentleman sing at a penny reading.—Here, Jack, bear a hand!'

Jack, the assistant, put his head out of the forecable scuttle, followed by the rest of his stalwart person, and coming aft, proceeded to help my friend the diver to dress me. Taking off my canvas shoes, I drew on a pair of long woollen stockings which came up high above the knees; and then, having had my wrists generously anointed with soft soap, I stepped into the dress proper, which is a huge combination sort of garment made of india-rubber, terminating in long leg-pieces like fishing-stockings, and fastening close round the neck, and ending at the wrists in rubber cuffs, which are so tight as to thoroughly exclude the water, and are the cause of the anointing with soft soap.

'Boots next!'

Great brogues fastened by straps and buckles, and having thick leaden soles, are brought, and filled with water, to enable them to be slipped on over the rubber-clad feet.

'Not exactly dancing-pumps,' quoth Jack as he fastens them.

On the chest and round the shoulders are a row of copper studs, and to these an oval collar of copper is securely bolted by nuts tightened by a formidable-looking key.

'Now for the helmet, mate.'

Jack carefully lifts the copper head-piece, which has a round window of thick plate-glass on each side, and a front-plate which is open, and placing it on the collar, screws it round and round down to it. The air-tube is attached to the back-part, and there is a valve under the right ear, to let out the used-up air; and a second one just below the throat. A slab of lead is hung over the shoulders, and attached to the chest like a small cuirass—a similar one forming a back-piece—a thin rope is fastened round the waist, and threaded through an eye on the helmet, and then I am ready for the mouthpiece.

'You'll feel a bit choky, maybe, when you get screwed up, but you'll soon get used to breathing the air,' says Rose encouragingly, as he fixes the front-plate of glass and screws it round.

It is a most curious sensation being thus completely cut off from the outer air—and even world, it seems—and one's voice sounds uncanny in the great hollow metal chamber in which the head is encased. The air whistles along the tube, but brings none of the unpleasant effects of choking,

or even gasping, and so I am ready to go down.

Rose, the diver, looks in at the face-plate, sees that all is right, and asks: 'Are you ready?'

I nod my head; and then repeating the signals: 'One pull on the rope, all right—four pulls, haul up; one tug at the tube, less air—four, more air'—he helps me over the side of the *Albatross*; and getting my feet on the rope-ladder, down I go. As my head goes under water, there is a slight buzzing in the ears, but it ceases before the bottom is felt. A line is fixed to the ladder, so there is no difficulty in finding it again; and it is quite safe to wander away, the only difficulty being to keep my feet on the ground, for the air which fills the helmet and inflates the whole suit more or less, makes it hard to even walk on tiptoe, in spite of the weight of the dress, which is a little short of two hundred-weight altogether. All round, the light gleams yellow, and everything is magnified by the water and thick glass, and a curious waving motion is apparent; whilst the air rumbles incessantly like surf on a lee-shore, and the stroke of the pumps resounds with regular monotony. Whatever other sensations a diver may experience, there is emphatically a feeling of utter loneliness; such as I once experienced when left at the bottom of a fall some twenty feet deep in a cavern up on Ingleborough, with wet candles and a broken lamp, for full fifteen minutes, whilst my companion took our one light with him, and returned to daylight for a rope and more candles, leaving me in total darkness, with the roar and spray of an unseen cascade filling the gloomy chamber.

'Unless you be an officer in one of the swell cavalry regiments, sir, I doubt if you've been rigged up in as expensive a suit as this,' said Rose as the helmet was unshipped. 'It cost one hundred and sixty pounds—the whole thing, that is; and when you were in it, you beat a Chinaman all to fits, for you'd a pigtail of an air-tube one hundred and twenty fathom long.'

'Pay?—Yes; it's good; but you see it had need be, for the risk, there's no denying, is big. Sometimes we make a good haul, if we have a special job and get special terms. Now, there's an old mate of mine just retired on twenty thousand pounds he's made of one venture. He and another diver "spec'd" on going down in deep water to a steamer as had a quantity of gold on board, for half what they raised; and they managed ninety thousand odd or so. Of course, these were extraordinary terms, and they had rare luck, and I never expect such. But anyhow, I like the life, and it likes me, and so I am very well satisfied to go on for long enough as I am.—And I'll tell you what, sir, if you take a fancy for the work, and would like to go in for the profession—yes, as I was saying, if you've a mind, I wouldn't say "no" to taking you 'prentice, and I think I could turn you out a first-rate diver.'

But as the *Volsung*—586 Royal Canoe Club—slips merrily away through the tossing wavelets, which send their little kisses of spray across the polished deck as they scatter in glittering surges before the sharp stem, her skipper decides—as the fresh bracing breeze steals past him over the blue waters towards the sunlight cliffs, and away over the waving corn-fields atop to the green slopes of

the distant Yorkshire wolds—that 'a life on the ocean wave' is to be preferred to one beneath it, where

In the caverns deep of the ocean cold  
The diver is seeking a treasure of gold,  
Risking his life for the spoil of a wreck,  
Taking rich gems from the dead on her deck;  
For fearful such sights to the diver must be,  
Walking alone in the depths of the sea!

### CRUELITIES TO PIT-HORSES.

A CORRESPONDENT, Mr W. Morgans, Bristol and Westminster, writing to the *Colliery Guardian* for 1st July, makes an appeal regarding horses that work underground, or, as they are termed, Pit-horses.

He says that many proprietors and managers of collieries take pains to protect horses from ill-treatment in the mines; but there can be no doubt that in other and numerous instances, cruelties to horses go almost unchecked. One common form of ill-treatment is working horses with sores fretted by the harness. Sometimes the cause is misfitting or bad harness, and sometimes neglect of washing parts where the hair has clotted by sweat and where the harness presses in work. Much could be done to avoid all this by better supervision of the stabling arrangements and by keeping spare collars, that one may be drying whilst the other is in use.

Another evil he points out as arising from bad grading of the roads, whereby, in running down steep places, the horse may come to grief in the dark passage, and get caught and jammed by the upset wagons. Colliery officials could, he says, sometimes mitigate this evil, and save expense in the longrun, as I have proved by experience, by easing steep gradients, and checking the bad practice, often seen, of driving roads too steep, especially in getting through faults.

'Special mention,' he continues, 'should be made of gross negligence occasionally exhibited underground in the supply of drinking-water to horses, an evil which is carried in certain cases to distressing lengths, the doctrine being that horses sweat less when kept short of water. In colliery-work, horses should usually be allowed extra supplies of tepid water; instead of which, an utterly inadequate supply is by no means uncommon, particularly if the water is brought down the pit, and some one can save himself trouble by stinting its use. The most abominable cases are perhaps to be found amongst those animals which are used in remote workings, a mile or two from the pit and from the regular stables and water-cisterns. When the day's work is done, these horses should be taken back to the stables—a duty which is sometimes shamefully neglected. It is easy to send corn and hay in the ordinary wagons to the remote places where the horses are detained for work; but as for drinking-water—alas! the special means for conveying it are in some cases so ill-contrived, or so neglected or forgotten, that the poor brutes get scarcely a sip of it where they are at work. Only about a year ago, a case came to my knowledge where several horses suffered so acutely from thirst as to rush towards the miners when drinking tea out of their cans—craving for the liquid they could hear bubbling into the men's mouths! Some of those horses

were well known to have died from sheer thirst and exhaustion from overwork; and in their extremity, were known to seize the men's tea-cans between their teeth, in a vain desire to get at the liquid inside! I forbear mentioning cases of vile teasing, striking, and kicking of pit-horses, and of working them in unfit states. It would only harrow and sicken the feelings. Yet the wrongdoers are hardly ever brought to justice.

'The officers of the Society for the Prevention of Cruelty to Animals have no legal power to enter the mine—a defect in the law I, for one, as a mining engineer, should like to see remedied, and I believe owners and managers generally would approve of the change. Their responsibility for the protection of human life leaves colliery officials less opportunity than many of them would like for care of the horses—of which as many as fifty to one hundred may be in a single mine—and it would strengthen managers' hands in checking brutality if they could warn those in charge of horses that acts of cruelty might be detected at any time by the visit of an officer whose duty would be to prosecute in such cases. I do not make any charge against colliers as a class. I am satisfied that with their known brave and generous instincts, they are opposed to cruelty, and they often condemn it when practised. . . . I trust that all who read this will increase their exertions to protect those pit-horses which are cursed by being in bad keeping or in bad hands, and that steps may be taken to enlist public interest, in order that officers of the Society for the Prevention of Cruelty to Animals may have the same right to enter a mine as to enter a cattle-market.'

### WHERE AND WHEN.

WHERE the unsheathing needles of the larch

Weigh, crimson-coned, the long, supporting spray,

And mingle to complete the fragrant arch,

With lowly lilac and the snow of may,

A twain had trusty, and the bending boughs

Stirred with the echo of a lover's vows!

When round the jewelled gossamer the haze

Of morning quivers on the upland wold,

Till the young corn, beneath the fervent rays

Of the noon sunlight, brightens into gold—

Day-dreaming of her absent love, a maid

Seeks the green twilight of the forest glade.

When the ripe weight of leaning sheaves is borne

In the last wagon, from the stubbly field,

And but the small red berry of the thorn

Reminds the wanderer of the harvest yield,

A listener at even, hears the fleet,

Off-prayed-for echo of returning feet.

When the world hushes in enfolding snow,

And icicles, depending from the eaves,

Weep in the wintry light; while Frost below

His fairy fancies o'er the window weaves,

Twain linking life and love—'Till death us part,'

Know but the warm midsummer of the heart.

## A CHAT ABOUT AMBASSADORS.

DIPLOMACY as carried on by the British government may be said to consist of three great departments. There is first the diplomacy intrusted to ambassadors; second, the diplomacy carried on by envoys extraordinary; and third, the diplomacy under the control of the *chargé d'affaires*, who can transact business with a foreign minister only. The British government has embassies in Paris, Constantinople, Vienna, St Petersburg, and Berlin; of envoys or plenipotentiaries extraordinary it has twenty-three; and three of *chargé d'affaires*. The constitution of the first of these departments implicitly includes the second and third.

The duties of an ambassador are not trivial, for he is abroad not only as the representative of his sovereign, but also as the agent of his government at home. In strict truth, the ambassador has to play the double part of master and servant: on the one hand, the splendour of the Crown whence his authority has emanated must be preserved; and on the other, he has to report everything that shall help his countrymen to legislate for the best interests of their empire abroad.

The practice of sending embassies-proper dates from the fifteenth century. It is true that the Romans had their embassies and spies long before the above date; but the embassies of the ancients must not be confounded with those of more modern times. A Roman embassy was but a makeshift, either for the purpose of concluding a hasty treaty or for demanding hostages. Therefore, it will be quite evident to any one, with even the slightest knowledge of what a British embassy is, that Roman and British embassies differ entirely from each other. All British embassies sent out between the fifteenth and eighteenth centuries made their exit in a most imposing style; and even until the year 1840, special war-ships were provided for their removal.

Every ambassador going abroad requires letters or credentials from his sovereign; and these letters must be presented to the king or ruler at whose

court the envoy is to reside. The contents of the letters are purely formal, and generally end with the assurance that whatever the ambassador does in the sovereign's name, the sovereign shall stand by it.

The relative position of ambassadors has been the subject of many disputes; the spirit of rivalry has always been very keen—so keen, that it has even spread to the courts represented. When an ambassador arrives from his country, it is the duty of the court at which he is to reside to see to his comfort in the way of providing coaches and other minor matters. The ambassador has many privileges, and one of these is the liberty of standing covered in the presence of royalty. In the past, it was customary for the ambassador of the first power to stand on the sovereign's right hand. Sir Henry Vane, the representative of the English Queen, was placed in this position by the Doge at the Council of Ten in the city of Venice. The knotty problem regarding position is now settled according to the date of the ambassador's arrival. The custom of making formal speeches to the court and by the court is also done away with, although in the courts of Vienna and Berlin there is still a survival of the ancient mode of procedure. As regards formality and show, no court in the world can rival that of Japan; there everything is done in the grandest style.

It is in the power of a sovereign to refuse an audience to an ambassador who may not be a favourite; but such instances are rare, because it is generally well known before the ambassador sets out whether he will be pleasing or otherwise. While at court, the ambassador ranks next to princes of the blood; and according to Her Majesty's rule in St James's, plenipotentiaries follow dukes, but in all cases precede marquises. On the continent of Europe, audiences can be obtained by ambassadors from the sovereign without the attendance of any government official or minister; this is not the custom in Britain, because at every audience there must at least be one member of the cabinet to represent the

government in power. George IV. liked these private audiences, and this explains the great influence wielded over the king by such men as Prince Lieven and Estaraliz. Canning was continually complaining of the deeds of these meddling envoys, and generally summed up his complaints with the quaint remark, 'His father [George III.] would not have done that.'

The person of an ambassador is considered inviolable. This law prevailed in the ancient world; because it was for a breach of the 'international agreement' that Alexander the Great laid the city of Tyre in ruins. And nothing was better fitted to rouse the ire of Roman patriots than an insult done against the person of their *legatus* or ambassador. In modern times, there have been instances of this 'inviolable' law being disregarded; thus, Dr Donislaus was murdered at the Hague in 1649; and in our day we have seen the natives of Cabul storming the British Residency in that city and slaying Cavagnari (the Queen's deputy) and most of his associates. Such occurrences mark the time as a period when passion and blind fury are the guides of reason. Further, to intercept an ambassador going through the territory of a third party is a great and culpable offence. The Sultan had no scruples in treating the envoys of his enemies with the greatest severity; for whenever war broke out, the ambassadors were placed in a prison called the Seven Towers, and kept there until all hostilities ceased. The Turkish government continued this practice up to the year 1827.

During the reign of George III., the British ambassador in the person of Lord Whitworth was insulted by Bonaparte, at that time First Consul of France. Lord Granville, from his place in the House of Lords, had declared that France by her warlike preparations was artfully at war with Britain, and demanded an explanation of Bonaparte's conduct. Whitworth at the time was the British envoy. When the representative of Britain was announced, Napoleon, who had been frolicking with his nephew, entered the audience chamber, and thus accosted Whitworth: 'And so you are determined to go to war.'

'No,' replied his lordship; 'we are too sensible of the advantages of peace.'

'We have already,' continued the First Consul, 'been at war for fifteen years, and it seems you wish to fight for fifteen years more; and you are forcing me to it.'—Then turning to the other ambassadors who were standing near, Bonaparte exclaimed: 'The English wish for war; but if they are the first to draw the sword, I shall be the last to sheathe it. They do not respect my treaties. In future, they must be covered with black crape.' Then resuming his conversation with Lord Whitworth, in an angry and insulting tone, he said: 'If you wish to fight, I will fight also. You may kill France, but never intimidate her.' In his excitement, Bonaparte threw himself into a threatening attitude, and even raised his cane, while Lord Whitworth laid his hand upon his sword.

This insult to Britain in the person of its envoy produced a profound sensation throughout Europe, and it was also one of the 'provocative' causes that led up to Waterloo.

But the British themselves have not always respected the rights of ambassadors, for during the regime of Cromwell the brother (Don Pantaleon Sa) of the Portuguese envoy was put to death. Don Pantaleon was a reckless fellow, and while in the Exchange, London, with about thirty associates, he started an altercation with the bystanders, which terminated in a free fight, in which one man was killed. The offenders took refuge in the house of the Portuguese ambassador, and this latter individual, according to his rights, refused to give them up, and wished that Cromwell might be made aware of the circumstances of the case. When Cromwell heard of the matter, he gave the envoy two alternatives—either to deliver up the offenders, or be delivered himself and all his company into the hands of the mob. The former was preferred. Pantaleon was arraigned, but refused to plead. An instrument of torture, however, soon changed his mind; and a verdict of guilty was returned against Pantaleon and three of his friends. Many plans were tried to persuade Cromwell to grant a reprieve, but he was inexorable, saying: 'Blood has been spilt, and justice must be satisfied.' And the only concession he would grant was that Pantaleon, in consequence of his nobility, might be beheaded, instead of suffering the ignominious death of hanging.

Ambassadors are also exempted from the law of the country in which they are sojourning. The spot on which their houses are built becomes *their* territory, which fact is made known to all by the hoisting of the embassy's flag. This is not all, for no servant or other member of the ambassador's train can be arrested without their chief's consent. And the only redress obtainable by an insulted person is to appeal to the ambassador, and failing his approval, to carry the matter further, and lay it before the court which has sent out the embassy.

In the reign of Queen Anne, an ambassadorial quarrel occurred between England and Peter the Great, whose ambassador had been taken out of his coach in London and arrested for debt. Peter demanded that the sheriff of Middlesex and all others concerned should be punished with instant death; but Queen Anne directed her secretary to inform this autocrat that 'she could inflict no punishment upon the meanest of her subjects unless it was warranted by the law of the land;' and politely added, 'that she was persuaded he would not insist on impossibilities.' To appease, however, the clamour of the other ambassadors, who made common cause in the matter, a bill was passed through parliament to prevent such occurrences for the future, and with this the Czar had to be satisfied.

The embassy is entirely free of all imperial taxes, and can also get goods from abroad free of duty. With regard to local taxes, the ambassador, if he chooses, can refuse to pay such. In the matter of postage, the ambassador is on a footing of equality with all men; still, he can despatch free of charge his own couriers bearing his reports and other missives. These messengers are also looked upon as inviolable. In the days when travelling was done for the most part by means of the stagecoach, ambassadors had a prior claim to all post-horses.

The different forms of religion were at one

time a great source of annoyance to ambassadors ; but nowadays, whatever may be the religion of the people amongst whom the envoy is residing, he has the right to worship in the manner most suitable to the dictates of his own conscience ; hence, in the land of his sojourn he can build and retain his private chapel.

Such are some of the duties and rights of the men carrying on the diplomatic relations of this and other countries. In the course of historical events, we know that Britain has sent to other countries many eminent ambassadors, and has also had as eminent sent to her by other European nations. Two of the latter we desire to mention. The first is Prince Eugene, the devoted ally of Britain during the long war of the Spanish Succession. On January 5, 1712, he landed at Greenwich, and proceeded to London, where he was greeted by the populace with the greatest enthusiasm. Queen Anne received her illustrious visitor with all the marks of respect due to his rank and mission ; but Her Majesty was a very rigid observer of court etiquette, whilst her distinguished guest was more of a warrior than a courtier ; consequently, though he received in public every mark of royal favour, the queen did not fail to let it be known in her own select circle that he was no welcome visitant at her court. Yet her dislike seems to have had no other foundation than the fashion of the Prince's wig. It was etiquette for gentlemen to appear before Her Majesty in full-bottomed wigs ; and the Prince excited the royal lady's chagrin by appearing in a tie wig. The courtiers joined in Her Majesty's capricious disdain. But Eugene showed his contempt for these triflers and their petty formalities by satirically observing that, never having had a periwig of his own, he had ineffectually attempted to borrow one amongst his footmen and valets.

In the reign of George IV. another eminent ambassador, Marshal Soult, came to England. He also appeared at the coronation of the present Queen. At that time he stood on the left side of the throne ; and right opposite him was Arthur Wellesley, Duke of Wellington. The two soldiers had been opposed to each other on many a well-fought field ; and he is a strange man who can picture the two heroes linked with all the heroism of the Peninsular War without feeling touched with the thought that at times humanity can become one in spirit, for universal history, in reviewing the lives of Wellington and Soult, declares 'never was there a nobler victor or a nobler vanquished hero.'

## RICHARD CABLE, THE LIGHTSHIPMAN.

### CHAPTER XL.—THE FIRST SHELPH.

MISS OTTERBOURNE lived in a handsome old square Queen Anne mansion near Bath. It was built of Bath stone, with rusticated quoins to the angles, with pillars to the grand entrance. A stiff, stately house, with large park-like grounds and beautiful terraced gardens. The house—Bewdley Manor—was about four miles from the station ; and when Josephine arrived, a private omnibus was in waiting to receive her and her boxes. The coachman

was in half-livery, the boy out of it. They had come to fetch a servant, so they wore as little of the badge of servitude as might be, just as the officers of Her Majesty throw off their uniform the moment they are off parade.

'Be you the young lady as is coming to our place?' asked the boy, addressing Josephine.

'If you will explain to me what your place is,' answered Josephine, 'I may perhaps be able to answer your question.'

'Miss Otterbourne is our old lady,' said the boy. —'You take a hold of that end of the box, and we'll give it a hoist and heave it up on the roof. Looky' here ; stand on the axle, and you'll get it up.'

'I will call the porter to help you,' observed Josephine coldly.

'As you like, young woman ; but mind you—you tip him if he comes and helps.'

Josephine considered a moment ; then, without summoning the porter, stepped on the axle, and assisted in lifting her box upon the roof of the omnibus. If she tipped the porter, it would be with Richard's money. She had come to Bewdley to be a servant ; she must begin to work at once.

When she sat by herself in the conveyance with her small parcels, she began to realise for the first time the complete change in her circumstances. In the train, she had thought of her father, of Hanford, of Aunt Judith, of the Sellwoods, with a tenderness and melting of the heart which ever and anon filled her eyes. She had spent a happy youth at dear Hanford, following her own whims, going out in her boat as she liked, playing on her piano when she liked, amusing herself in the garden or in the house undirected, uncontrolled by any one. Now, she was about to pass into a position where she would not be able to call her time her own, where she might follow her own desires in nothing. At Hanford, she had been surrounded with friends—the kind, good Sellwoods ; Lady Brentwood ; old Sir John ; her affectionate but stupid aunt. Every one knew her there. Now, she was entering the society of total strangers. If she were about to associate with strangers of her own station, it would have been less disquieting ; but she was plunging into a social stratum which was to her as strange as the persons composing it, who were about to become her daily companions.

It was already evening and dusk as she entered the private omnibus at the station ; and she was tired with her journey by train, and with the strain on her mind through which she had passed. Through the square windows of the carriage she saw dimly the meadows, the high hedges, the trees, the cottages, where the lamps were being lighted. She heard the coachman and the boy salute and cast jokes at passing labourers. She saw and heard all, and without taking notice of anything. What she saw and heard mixed with what passed in her head, and formed a conglom-

merate of conflicting and new experiences and ideas, that left her bewildered and frightened. Presently, the coachman shouted and drew up; then, through the windows, Josephine saw a lodge, and a girl came out and threw apart the iron gates into a park. In another moment the carriage passed through, and the wheels rolled over the smooth drive to the house. Josephine saw that the grounds were extensive, wide lawns over which white mist was settling, out of which rose grand clumps of beech and elm, and here and there a solitary cedar. Then the omnibus turned out of the main drive, and in another moment was rattling over the pavement of the court behind the house. The carriage stopped. The boy came to the door and opened it.

'Here you are, miss,' he said. 'Step up on the axle and help me down with your box; unless you'd like to get on the roof yourself and pass it down to me.'

'I am afraid I shall not be strong enough to support it. Cannot a groom or some other man help?'

'Oh, I don't know. I reckon if you want anything done here, you must do it yourself. Every one here is so frightfully engaged over his own work, and it is no one's place to help another.' However, the boy condescended to shout, and a footman came to the kitchen door. 'The young lady wants to be helped with her box,' said the boy; whereupon the footman came leisurely across the yard and took a good survey of Josephine, especially of her face.

'Come,' said he graciously, 'as you're so good-looking, I don't mind helping you. A little wanting in style, p'raps.—I am Mr Polkinghorn, and you are Miss—Miss'—

'Cable is my name,' answered Josephine curtly.

'No particular objection to alter it, I s'pose?' said the footman, who laughed at his joke. 'But it takes two to effect that—don't it, miss?' And he laughed again.—'You'll excuse my sportiveness, miss,' said he, taking the box on his shoulder as the boy let it down from the roof of the carriage; 'I'm generally considered a wit.'

When the box was on the ground, he dusted his shoulders and arms, and asked: 'And pray, what sort of people were you with last? Any style about 'em? People of rank and position and fortune?'

'This is my first place,' answered Josephine.

'You don't mean to say so! How on earth did our old woman come to take you, miss?—Oh, I remember—you was recommended by the Sellwoods. I knew them—not exactly intimately, but off and on; they come here to stay with our party. You see, they are relatives; and the cap'n will inherit our little place after the old bird hops.'

'Hops?' repeated Josephine, not understanding him.

'Ay—kicks.'

'Kicks? I don't understand.'

'Hops the twig, kicks the bucket.—How dull you are! I fear your education has been neglected. I observe there is something contrived and gawky about you.—Don't be uneasy; we'll put you to rights soon.—Now, my dear, take this handle, and Charley shall hold the other, and we'll soon have the box into the kitchen.—You'll excuse me lending a hand—a weight on the

muscles of my arm makes them shake, and I have to be very particular that they are not unsteady. I have to carry the glass and plate, and the candles. I wouldn't spill the wax on the carpet nor for worlds.—So you know old Sellwood, do you? A worthy old chap. Pity he's a parson; he ought to be Squire. I know his elder brother, and don't think much of him. There's not the true ring about him that I like to find in the British aristocracy. The grand old English gentleman—you know the song. The young man will inherit this property, you know—it's a tidy estate. One can live on it without any of your dirty, sneaking, underhand pinching.—Look here, pretty! Don't encourage no familiarities on the part of Mr Vickary, the butler. He and I differ in politics. He's an out-and-out Radical, and it is asserted he has got a wife stowed away somewhere.—You can always fall back on me, if he makes advances. My name is Mr Polkinghorn. There is a village in the west of England that takes its name from our family.—Cable is your name, is it? Rather clumsy work tying a true-lover's knot in a cable.—You'll excuse my fun, dear; I'm always considered a wag.'

Josephine's face was dark with indignation and with heat, when she reached the kitchen. Mr Polkinghorn had made her carry one side of the box, whilst he walked behind advising steadiness, as she and the stable-boy ascended the steps to the kitchen carrying the box.

At the door, Mr Polkinghorn gave Josephine an aside: 'Mind you give yourself no airs, miss. Airs ain't tolerated in our little place. It's the one thing we can't swallow. Airs are, so to speak, fatal.'

He stepped nimbly over the box into the middle of the kitchen, and addressed a portly woman there, wearing an apron, and a flaming red face: 'Mrs Purvis, allow me to introduce Miss Cable to you—a young lady introduced to us by our mutual friends the Sellwoods. She solicits your kind patronage.—This, Miss Cable, is our artist, Mrs Purvis;' aside, behind his hand, 'Cook.'

Then to a maid-servant: 'Miss Woods, permit me—Miss Cable, Miss Woods.—Where is Miss Raffles?—Oh, attending to duties up-stairs; very well.—Sorry not to be able to introduce you to Miss Raffles. She is drawing the blinds, I presume.—But here is our sprightly Miss Wagstaff, a host in herself.—Miss Wagstaff, Miss Cable; Miss Cable, Miss Wagstaff.' Then, aside, 'Scullery-maid.'

'What is the meaning of this?' asked Mrs Purvis, without noticing Josephine. 'Is my kitchen a back hall, is it a lumber-room?—What have you dared for to bring a box in here for, and—preserve us, a cage with a bird in it? Is this an aviary and a zoological garden?—Take 'em all away at once. Mr Polkinghorn, Charley, what do you mean? Take 'em away instantly into the back hall. I'm not going to have my kitchen made into a rummage, not for any Cables or Tables or what you may call 'em.'

'It's the curry,' whispered Mr Polkinghorn to Josephine. 'When there's anything for dinner requiring cayenne, or chilli, or anything spicy and hot—it gets into her temper. She'll be right enough when she's slept it off.—Come along. I'll

show you the way with the box into the back hall.—Charley! help the lady.—Miss Woods, is it asking too much of you that you should step up to Mrs Grundy and inform her of the arrival of the lady recommended to us by the Sellwoods?' Then aside, 'Housekeeper, Grundy is.'

'Hulloa!' exclaimed the butler, stepping in, a man with white head, red blotched face, and yellow, watery eyes—a man with a sour and dogged look. 'Our new arrival.—Humph! Had a long journey. You shall have a glass of cherry brandy with your supper.'

'He approves of you,' whispered Mr Polkinghorn, 'or he would not have offered cherry brandy.—Beware! He don't offer mistress's cherry brandy to every one. Miss Raffles has never wetted her lips to it, I believe. Mr Vickary doesn't like her. Her nose is badly shaped.'

Josephine was taken to the housekeeper's room. Mrs Grundy gave orders for her box to be taken up-stairs and who was to do it. Without orders, no one did anything; and with orders, did extra work grumbling.

Josephine was shown her room by the second housemaid, Jane. She was not to have a room to herself; she must share that of Jane—that is, of Miss Raffles. The room was at the top of the house; it was lighted through a small window, concealed from sight without by a stone parapet. The window therefore looked upon a blank wall three feet off. Not a ray of sun could penetrate the room; all the light it received was reflected from this parapet, that was covered with mildew and lichen. In Queen Anne's time, mansions were erected with strict adherence to proportion; and if servants' rooms were needed, they were crowded into the roof and hidden from sight. The tall windows belonged to staterooms and the dwelling-rooms of the gentry. Those who ministered to their wants were stowed away in out-of-the-way corners, lighted through passages, from staircases, by panes of glass let into the roof. Anything was good enough for them.

'You see,' said Miss Raffles, 'the window is nailed up. That's Mrs Grundy's doings. The servants' windows all look out on the leads, the gutter that runs round the parapet, and they could get in and out and run round and pay each other visits just as they liked—and there was some goings-on, I can tell you. So Mrs Grundy had the carpenter up, and he screwed up all the windows that they don't open any more.—Lor bless you, it don't matter so far as air goes; we are at the top of the house, and that ought to be the airiest.'

Josephine seated herself on her bed and leaned her head in her hand. 'This was the hardest trial of all—not to have a room to herself. If she could have been given the smallest garret chamber, in which she could at times be alone, it would have been endurable; but she felt that this was more than she could bear, to have no privacy day or night.'

'I hope,' said Miss Raffles, 'you'll get on with our mistress. She ain't bad if you get the right side of her.—But mind you, keep on terms with Mr Vickary, the butler; he well nigh rules the mistress. She thinks him the most dutiful and faithful and excellent man. She takes his advice on every thing; and if he don't like a servant,

it ain't long that servant remains in the house.—I don't think much of Mr Vickary myself. They say he has had two or three wives, and has them still stowed away in different parts of the country unbeknown to each other. Mr Vickary is that deep in the mistress's confidence that she lets him manage her money matters for her—leastways, in household expenses.—Hark! There's the bell ringing for us. Mrs Grundy has a wire to the top of the house, and calls us, if we go up just now and then to lie down and read a novel. She thinks now we've been too long; or perhaps the mistress wants to see you. We won't go down at once. Let them wait. You haven't unpacked your box yet, nor I seen what you have got. I say, have you a photograph of your young man?—Drat it! there's the bell again. I suppose it is missus, so we must go down; or—I say—if you give me your key, I will unpack your box for you.'

Josephine went slowly down-stairs without answering the loquacious Jane. Her heart sank within her. Would she be able to endure this association with chattering, empty-headed housemaids, conceited and pert footmen, and a tyrannous, unprincipled butler? Mrs Grundy struck her as a formal, dull woman, whose chief ambition was to stand well with her mistress and retain her place. If Mr Vickary lorded it in the house, Mrs Grundy would shut one eye to his misdeeds.

Josephine had taken off her wedding ring when she left Hanford. She carried it hung round her neck by a small silk ribbon. It would not do for her to wear it. The sight of the ring would provoke questions which it would be difficult for her to answer.

The housekeeper was at the foot of the back-stairs. 'Miss Otterbourne desires to see the new lady's-maid.—You have no need to wear a cap. A lady's-maid is not required to have one. Follow me, Miss Cable.'

Mrs Grundy led Josephine out through a side-door upon the main staircase. The back-stairs were exceedingly tortuous and steep, so tortuous and steep that it was difficult to descend them quickly without a fall. The grand staircase occupied a well in the middle of the house; the flight was broad, the steps deep, the rise slight. The steps were carpeted with rich pile purple and crimson and maroon.

Miss Otterbourne sat in the great drawing-room, a lofty and very stately room, that at first glance reminded Josephine of the parlour at Brentwood. It had in the centre a glass chandelier, encased in yellow gauze, and looked like a gigantic silkworm's cocoon suspended from the ceiling. Large and handsome oil-paintings covered the walls. The furniture was gilt; curtains and chairs and sofa-covers were of crimson satin.

At the end of the room was a fireplace with a wood-fire burning cheerfully in it; and near the fire, at a small table, on which was a lamp, sat a very little lady, with white hair done into barrel-curls about her brow; dressed in slate-gray rich silk, and wearing a handsome shawl over her shoulders.

'Grundy,' said Miss Otterbourne, 'may I trouble you to ring the bell for William? I want another log putting on the fire, and the pieces

of half-burnt wood heaping together with the tongs.'

'Certainly, miss,' answered the housekeeper, and rang the bell.

'Oh,' said Miss Otterbourne, 'is this the young person recommended to me by my sister?' She put on her glasses and looked at Josephine. The room was so vast, the light from the lamp so slight, that she could not see much of Josephine. 'Oh—you look rather young and inexperienced. But of course my sister—that is, Mrs Sellwood—knows. I rely on her. I hope you will conduct yourself satisfactorily.—Oh, William, another log, please. I believe there are some still in the wood-basket.—Mrs Grundy, you will see that this young person has refreshment. She need not enter on her duties till to-morrow. She is probably tired with her journey from Hanford. I have never been to Hanford myself. I do not care to leave Bewdley, as the vibration of a railway upsets me.—Dear me! Grundy, will you touch the bell again? I want to tell William to make quite sure the fire is out before he goes to bed. I suppose, Grundy, the horses can hardly be taken out so as to give me a drive to-morrow? they have been to the station to-day for this young person.—That will do, Grundy.—I hope you will conduct yourself well, Cable. My servants are tried and trusty. You can always refer in all matters to Mrs Grundy or to Mr Vickary; they know my tastes and opinions.'

When the housekeeper left the room with Josephine, she signed to her to attend her in the little parlour which she occupied herself.

'You may sit here,' she said graciously, 'for a while. I will talk to you, and you can listen. I will tell you what you have to do.—Miss Otterbourne is a very kind mistress, if you conduct yourself properly; that is, if you satisfy Mr Vickary and me. Miss Otterbourne has the greatest regard for my opinion and for Mr Vickary's. Now, mind, you never complain to me of anything Mr Vickary says or does; nor of anything that goes on in the kitchen, about broken meat or so on; nor about the dairy. The dairymaid manages that, and it is no concern of yours. You are lady's-maid, and it is no concern of yours what goes on outside your department. All that is my affair and Mr Vickary's. Live and let live, say I.—Now, mind, you don't try to disturb the mistress's confidence in Mr Vickary or me; for if you do, it will be so much the worse for you. You will very likely have to leave without a character.'

Josephine's head was sinking on her bosom; a feeling as if she had been struck on the head and stunned, deprived her of the power of speech.

'A lady's-maid,' pursued Mrs Grundy, 'has a place so near her mistress's ear, that she can make herself very unpleasant, or the reverse, to her fellow-servants.—Now, please to remember that all will go pleasant if you don't say anything but good to the mistress about Mr Vickary and me. If, however, you attempt any insinuating and countermining, it will be yourself as will suffer. You understand that?'

'May I have a postcard, Mrs Grundy?'

'Certainly, if you have a ha'penny to pay for it. What do you want it for?'

'I promised to send a line to—to Mrs Sellwood, when I reached this place.'

The housekeeper produced the card, and indicated ink and a pen.

Then Josephine took the pen, dipped it, wrote the address dreamily, turned the card, and on the other side inscribed these words only:

'Yes—winkles, cockles, oysters.'—J. C.

## OTTO OF ROSES.

ROSE oil, or attar, ottar, or—more commonly—otto of roses, is one of the most exquisite of perfumes, and, if obtained in its pure, unadulterated state, certainly one of the best, and withal one of the most expensive essences furnished by nature. At the present time, the market value of the finest rose oil is about nineteen pounds sterling per pound, this being the wholesale price. Although greatly appreciated, especially by the fair sex, comparatively little is popularly known regarding its origin and the conditions under which it is obtained.

Otto of roses is prepared in the East, especially in India; but it is also largely manufactured in Europe. Some rose oil is extracted in Southern France; the principal place of origin, however, is South Bulgaria. When crossing the Balkan Mountains southwards by the only road practicable for vehicles, the well-known Shipka Pass, of evil notoriety since the last Russo-Turkish war (1877–78), on account of the fearful loss of life which its defence entailed, the traveller sees opening out before him the beautiful valley of Kusanlik, bountifully provided by nature, in which the Bulgarian rose oil is prepared. The culture of the rose of South Bulgaria—or, as it is now known, Eastern Roumelia—extends over nearly one hundred and fifty towns and villages, distributed in a circumference of from five to six days' journey, and the centre of which is the town of Kusanlik, other important towns being Karlova, Tschirpan, Stara-Sagora; but the valley of Kusanlik proper supplies most of the rose oil obtained, and certainly the best descriptions of this precious essence.

The species of rose mostly cultivated in Bulgaria, and used for the manufacture of rose oil, is that known as *Rosa moschata*—as a rule, of light pink colour, rarely white, and not very full in bloom. The rose oil found in the European market mostly comes from Southern Bulgaria; the oil produced in the East, and in India especially, being used in the land of its origin. The oil derived from *Rosa provincialis* in Southern France is also of exceptional quality, but not only much dearer than the Bulgarian product, but obtained in such small quantities that the whole of it does not cover the wants of the districts where it is manufactured. It should be mentioned that efforts have been made in some parts of Germany to produce the oil; but the success attending them cannot be called very brilliant, for it was found that at least two thousand pounds-weight of rose-leaves, but more frequently double that quantity, were required to manufacture one pound of otto

of roses. The rose used in the production of Bulgarian rose oil is in bloom during May and June. It succeeds best on sunny hillsides, covered with a sufficient layer of medium loamy soil. The rose-bushes when fully grown reach a height of six feet, and are planted in rows a foot and a half apart at intervals of three feet. They must be carefully attended to from autumn to the time of the harvest. As a rule, rose oil obtained from villages more highly situated possesses a higher freezing-point and a more intense but at the same time more pronounced smell; whilst the product of the lowlands has a lower freezing-point and a milder, finer aroma, and is consequently preferred. These several properties of rose oils must consequently be blended, in order to obtain a quality possessing the fine aroma and other properties inherent in a perfect oil. Great experience is therefore needed in manipulating the article, and this knowledge is all the more requisite when large quantities of rose oil are required. An important factor in the success of the rose-oil harvest is the weather prevailing during distillation, always supposing that the rosebuds have not previously been injured by frosts, lengthened dry weather, or from other causes. If these facts are borne in mind, it is apparent that it is impossible to fix the price of rose oil before or during the time of distillation. That can only be settled after the harvest is completed, mostly during July, and is arranged between the producer and the exporter, after weeks of negotiation. Rose oil thrown into the market before that time is oil from previous years, generally of less value, which it is thus sought to get out of hand before the season's arrivals.

Cool and rainy weather is the best time for distillation, as it prevents rapid blooming, and thus extends the time of harvest, and enables the producer to gather his roses gradually, at the same time that it increases the bulk of the harvest. The state of the weather during the process of distillation is of great importance, the yield varying from one *metikal* of oil from eight *okas* of rose-leaves to one *metikal* of oil from eighteen *okas*;\* in other words, to obtain five grammes of otto of roses, between ten and twenty-three kilogrammes of rose-leaves are required. In the most favourable case, therefore, two thousand pounds of rose-leaves are needed to distil one pound of otto of roses; in the most unfavourable instance, four thousand six hundred pounds of leaves are wanted to make one pound of the essence. It will be easily understood that, in order to obtain such large weights of the light leaves of the rose, large tracts must be under rose cultivation. At the same time, a great number of distilling apparatus must be employed and suitably distributed. The flowers ought all to be collected, if possible, before sunrise, so as to retain the ethereal oil, which otherwise quickly evaporates if the sun's rays become too powerful. There have been schemes for erecting manufactories of rose oil in Bulgaria; but from what has been stated, the folly of such attempts is

apparent. As a matter of fact, there is not a single establishment of such a nature in the whole of Southern Bulgaria, the question of expense, long distances, and insufficient means of communication, and consequent loss of aroma by transport, all operating against the erection of rose-oil 'factories.' The peasants gather the roses themselves, produce the oil as a kind of domestic industry, and sell the finished product after the harvest. Some exporters pretend that they rent the best rose-fields from the owners, so as to secure a connection; but this is not true. What does happen is this, that respectable dealers in rose oil make advances to peasants upon whose honesty they can depend; and thus they are sometimes able to secure the finest descriptions of the essence; for, as in most industries, there is a deal of adulteration going on in the manufacture of otto of roses. Honest producers erect their distilling apparatus in the open fields; but there are many who distil geranium oil over roses in carefully secluded distilleries, for purposes of adulteration. Of course such men are avoided by respectable merchants; but still the fact remains that much adulterated oil gets into the market. Oil or otto of geranium, also called *idris* oil (from the Turkish *âdrisçehâh*), is produced in India, especially in Surat, by distillation of andropogon grasses with water. The scent of the several products of distillation varies according as more or less of the herbage of other plants is introduced during distillation, no care being taken to pick them out before distilling. Although the government of Eastern Roumelia, as a measure of protection, exacts a heavy duty, amounting to two hundred per cent. of the value, upon the introduction of geranium oil into the rose districts, a great deal is smuggled in, those dealers who have the greatest interest in promoting adulteration being the chief offenders. It is a pity that the government does not devise more energetic measures against the importation of geranium oil; but to a great extent the mischief may be, and is, counteracted by the policy of respectable merchants of buying rose oil only of producers upon whose honesty they can thoroughly rely.

During Turkish rule, there was, besides the tithe levied, an export duty of eight per cent. *ad valorem* upon otto of roses; but this has gradually been decreased to one per cent., whilst the tithe has not been exacted for the last two years, its place being taken by a ground-rent adjusted according to yield. The average annual yield of the Bulgarian rose-oil harvest may be taken at between three thousand two hundred and three thousand five hundred pounds. During good years, such as 1879 and 1885, it rose to over five thousand pounds. In bad seasons, owing to frost, hail, or a long spell of hot weather and drought, such as the year 1882, the production scarcely reaches sixteen hundred pounds. An exceptionally favourable year was 1866, when about six thousand pounds of otto of roses was produced. The prosperity of a South Bulgarian village or town is frequently estimated by the pounds of rose oil made there. The finished rose oil is taken from the places of production, where it is acquired by the exporters, in round flat copper bottles, tinued over and most carefully soldered up, so-called 'estagnons,' in sizes holding

\* The *metikal* is a gold or pearl weight equal to about 4.5 grammes; the *oka*, a liquid measure, equal in Moldavia to 1.52 litre, in Wallachia 1.28 litre.

from one to six kilogrammes of the oil. It is still taken on the back of horses or mules over Adrianople to Constantinople, whence it reaches the European market.

## WYTHRED'S WHARF: A THAMES-SIDE TALE.

### CHAPTER II.—THE WHARF-OWNER'S STORY.

MR LINTOCK'S house, an old mansion in the neighbourhood of Greenwich Park, was surrounded by a high garden wall. The great iron gate leading into a large courtyard might have been the entrance to a prison; and its gloomy aspect filled Percy Overbeck's mind with vague fears. But when the front door was thrown open, and he stepped with the wharf-owner into a broad, well-lighted hall, all sense of dread was instantly dismissed, for at the foot of the oaken staircase stood Bertha Lintock. She was a tall, graceful girl of nineteen; and she always looked her best, in Percy's opinion, at these moments of greeting with her father; not that her dark eyes were wanting in their eloquent expression of welcome when they met his. But she simply said, in a charming tone of well-feigned surprise: 'Mr Overbeck? How very kind this is!' as she took his proffered hand.

Overbeck could not fail to notice, from Bertha's anxious glance at her father's face, that she guessed something had recently upset him. Was it possible that the girl had any suspicion that such a trouble as this, which he had accidentally discovered, weighed upon her father's mind? Bertha's first words, when they were alone in the drawing-room before dinner, 'Have you remarked the change in my father? To-night he does not seem the same man,' convinced Overbeck that she had been told nothing.

'He is greatly changed,' replied the young man. 'I am much concerned, Miss Lintock, about him.'

'Can anything be done?'

'I sincerely hope that your father will talk to me about himself this evening.—I shall draw him out,' he added laughingly, to reassure her, 'over our cigar.'

Bertha's eyes expressed her sense of gratitude.

During dinner, Mr Lintock was deeply abstracted; in fact, he left Bertha to do all the talking; so she and Percy conversed together to their hearts' content.

As soon as dinner was over, Bertha rose to leave the two men to their wine. While Overbeck stood holding open the door, the girl gave him one of those appealing looks as she passed out which he remembered long after.

'Now that we are alone,' said Mr Lintock, 'will you give me your attention for a few minutes? I want to tell you of the face that haunts me. I have intended for some time speaking to you. The incident in the train to-night has decided me.'

Overbeck having drawn forward an armchair, lit a cigar, and looked attentively at Mr Lintock—'I am deeply interested,' said he.

After a moment's pause, the wharf-owner asked: 'Do you remember, Overbeck, an individual named Clogstoun?'

Overbeck shook his head.

'He was a workman at the wharf. I dismissed him for insobriety.'

'A dark person,' said Overbeck doubtfully, 'with black hungry eyes?'

'That's the man,' was Mr Lintock's answer, 'as you describe him! That's the man whose face I saw at the carriage window to-night.'

Overbeck looked searchingly at the wharf-owner. 'Not *really*? You mean his ghost.'

'I mean the man's face. I have no belief in disembodied spirits.'

'But,' said Overbeck, 'unless the man is dead'—

'He is not dead. He threatens me: he has threatened me for months. I see his face everywhere,' said Mr Lintock, glancing round the room with that haunted look again—'everywhere, and always threatening.' For a moment the wharf-owner placed his hand across his eyes, as he had done in the railway carriage; but quickly recovering himself, he said: 'Clogstoun had often been employed on the wharf, and as often discharged, owing to his drunken and quarrelsome habits. He insulted every one whom he came across, when excited by drink, until it was thought that he must be out of his mind. When at last I refused to listen to his appeal to be given another chance, he muttered: "You shan't ruin me for nothing, Mr Lintock; you had better think it over." I did not like his look then: there was something strange in his eyes—a look that seemed to me to contain a touch of insanity. A few days afterwards he accosted me in Thames Street; and there he loaded me with insult, and vowed that he would not rest until he had taken my life.'

Overbeck started up with an angry exclamation on his lips: 'The man is mad!'

'I treated this threat, at first, as the silly utterance of a drunkard,' continued Mr Lintock. 'It gave me at the moment no real uneasiness. But as time went by, his conduct began to alarm me. He again accosted me, and became more insolent. I warned him that I should be forced, if he did not cease to annoy me, to take the matter before a magistrate.'

'Ah!' said Overbeck excitedly, 'you did right.'

'But that has had no effect. He still dogs my footsteps if I venture out after dark. I see his eyes fixed upon me at every corner. And unless something is done to put a stop to it,' said the wharf-owner, 'I shall fall ill. My duties at the warehouse are a sufficient wear and tear, without Clogstoun's wretched, drunken face threatening me night and day!'

Overbeck was pacing up and down the room. He could not rest with the thought of Mr Lintock harassed and insulted at every turn. 'Does any one know, except ourselves,' said he, 'about this affair?'

The wharf-owner reflected a moment. 'Duckett, I think, suspects something; no one else.'

'Not even your daughter?'

'I have never,' said Mr Lintock, somewhat evasively, 'spoken to her on the subject.'

After a moment's pause, Overbeck asked: 'Can you give me Clogstoun's address?'

The wharf-owner looked up in surprise. 'It never occurred to me, Overbeck, that he had any. In what hole or corner in London would he lodge? His appearance was no better, when I saw him last, than that of a vagabond or tramp.'

'He must be known to the police.'

'So I hope, for he has fallen very low. He was seen by Duckett last on London Bridge contemplating, I should think from the account he gave me, suicide or something worse. For is there a crime,' added the wharf-owner, 'that one so profligate would not commit? The very thought makes me shudder! If you had seen the man's face to-night, the dread would have laid hold of you—as it has of me—that my life is in danger.' He spoke in a very earnest tone. But there was no trace of agitation in his manner now. His words, 'My life is in danger,' seemed to express the conviction of a sound-minded man capable of mature reflection.

'You are seriously of opinion, Mr Lintock, that the face at the carriage window was real, and not imaginary?'

Mr Lintock, with a thoughtful look bent upon the ground, replied: 'That is a question to which I wish, Overbeck, I could give you a satisfactory answer. Is it real? The face, as I tell you, threatens me so momentarily—so unexpectedly: it seems real—only too real.' Then he suddenly added with a searching glance: 'You do not think my brain affected? Well, well; it's not surprising if you do. I have enough worry at the wharf, sometimes, without this one, to drive me crazy.'

Overbeck promised to take the matter earnestly in hand; and after some further conversation on the subject, of a reassuring nature, Mr Lintock proposed that they should go and join Bertha in the drawing-room.

She was at the piano. But she rose when they came in, and gave them tea, and paid some little, delicate attentions to her father, as a devoted daughter alone knows how. Then she returned to the piano and began to play a sonata that seemed like an accompaniment to her dreamy thoughts.

Presently, Percy Overbeck went softly to a chair beside her, for the wharf-owner had fallen asleep.

'He has spoken to you,' said the girl, still accompanying her dream. 'Has he not?' Her face was troubled, and tears stood in her eyes.

'We have talked the matter over. He has told me everything. Do not be distressed: there is really no need. Have confidence in me. Will you—as an old friend?'

There was little occasion to have asked this. Bertha's face, though troubled, had not lost its trustfulness. 'Why should you doubt that?' was the girl's reassuring reply. 'For weeks past I have wished that my father would speak to you. I knew that something disturbed him. But he is so considerate! He has done his best to hide it from me, fearing to give me the least alarm.'

'It is about a discharged workman—it is best that you should know—a fellow who threatens your father. The affair has unnerved him; but I hope to put matters right. You are not frightened?'

'No; not now,' said Bertha in a low voice—'not now, that you are lifting half the burden off our shoulders. How good it is of you!'

She was irresistible. Overbeck answered earnestly: 'There is no burden that I would not bear, Bertha, for your sake.'

'For me?'

'Yes, Bertha. I—I love you.'

There was a flutter of the dark eyelashes, but the girl did not raise her eyes. The accompaniment to her dream was almost inaudible now. Was the reality—the conviction of her love for Percy Overbeck dawning upon her?

The sonata was finished; and Mr Lintock awoke out of his nap. It was time for Overbeck to bid his friends good-night, for he intended to return by train to London. He caught a sweet timid glance from Bertha as he took his leave.

When the train was approaching London Bridge—and the glow of lamplight in wide and narrow thoroughfares threw a red reflection over the great city—Overbeck thought of the countless mysteries that lay hidden, in dark courts and alleys, in the midst of all this glare. Was this face which haunted Mr Lintock's life, thought he, in one among those shadowy by-ways?

### CHAPTER III.—THE THREATENING FACE.

Percy Overbeck's visit to Greenwich had effected a noticeable improvement in the wharf-owner's state of mind. The haunted look left him; his expression was altogether less careworn, and it would almost seem as if those strange forebodings which had lately perturbed his brain troubled him no longer. His interest in the business of the wharf returned, and Duckett found him one evening working in grim earnest at his desk.

'Well, Duckett,' said Mr Lintock as the foreman came in, lantern in hand, to light his lamp, 'who is on duty to-night?'

'I'm on duty, sir, until twelve o'clock.'

'Not alone?'

'Why, yes. The fact is, sir, I'd a special object in relieving the night-watchman.'

The wharf-owner's glance expressed surprise. 'What object could you possibly have?'

Duckett, still occupied with Mr Lintock's lamp, answered without raising his eyes: 'I'm expecting Mr Overbeck.'

'At what hour?'

Duckett handed the wharf-owner a slip of paper. A single line, which he recognised as Percy Overbeck's writing, ran as follows: 'Ten p.m. Wait at wharf.—P. O.'

Mr Lintock's face while reading this underwent a change; but recovering himself quickly, he said: 'Do you know why Mr Overbeck is coming here to-night?'

The lamp was now lighted; and Duckett, while placing it upon the wharf-owner's desk and adjusting the shade, replied: 'It's about Clogstoun. So I naturally suppose; for there ain't anything else that I can think of would bring him here at that time o' night. The note, just as you see it, was given to me this afternoon.'

'Who brought it?'

'One of Mr Overbeck's clerks.'

The wharf-owner looked thoughtful. 'I have plenty to keep me busy till ten o'clock,' said he, throwing a glance over the papers before him. 'Mr Overbeck is coming, depend upon it, about Clogstoun. I shall wait and see him.' Then taking up his pen, he added: 'You'll be within hearing, Duckett, in case I want you?'

'You've only to touch your bell, sir; I shall be sure to hear.'

It was the first time for many weeks that the wharf-owner had worked alone in the counting-house after dark; and it was not surprising that the dead silence and solitude, when he occasionally stopped and looked up from his desk, should remind him of the threatening face of Clogstoun. He had dismissed the clerks, for he had no need of assistance; every detail referring to the wharf was entered in the books upon the shelves around him. Still this dead silence and solitude seemed each moment more oppressive. Mr Lintock looked at his watch. It was past nine. What could Ducket, he wondered, be doing so noiselessly down-stairs? It was strange that he had neither heard the sound of his footstep nor of his voice. The wharf-owner thought: 'If Ducket would only sing or move about the warehouse, the sense of loneliness and dread which is creeping over me would be removed. Shall I touch the bell?'

He tried manfully to dismiss this feeling and to find absorption in the work before him; but there now arose in his mind, more vividly than it had ever done, this haunting face. He imagined the figure of Clogstoun, as Ducket had described it, leaning over the parapet on London Bridge. Was the man there to-night? The wharf-owner could not resist the temptation to stretch out his hand and draw back the curtain from his window and look out upon the dark river. The lights flickered on London Bridge; but they were dim—too dim to have enabled Mr Lintock to distinguish one figure from another. Yet he fancied that, dark as it was, he could discern a shadowy form standing near the centre of the bridge, and that the form resembled that of the man with whose face he was so painfully haunted. He dropped the curtain with an angry gesture. 'What if Clogstoun is there?' he exclaimed aloud.

But the wharf-owner's hand trembled now; he could not write. The black horrors which he had resolutely overcome began again to crowd his brain like imps of darkness; the more he tried to chase them from him, the more they swarmed. His imagination awakened into terror at last. A firm conviction took hold upon him: it was like a nightmare which no strength of will could drive from his brain: Clogstoun was staring at him through the glass partition in the clerks' office like a cat watching its prey!

Mr Lintock sprang to his feet. At this moment the great gate-bell in the courtyard of the warehouse began to ring.

Laws have been passed placing large powers in the hands of local and parochial Boards, by which vast improvements have been made, and immense sums of money spent in such works as the sewerage of towns, laying down systems of water-supply, and the clearing away of wells in urban places. Hospitals also have been erected, both general and special, and everything that skill and science can devise is now devoted to the battle with disease and dirt. Nothing is more costly to the individual or the State than disease, and whatever may be said or done in the interests of the health of the nation or town should receive the hearty support of all.

Among the great middle class, much can be done to promote the health of the family and the community by the exercise of a little wisdom and good sense. With that end in view, the following hints are given as being suitable for the information of those who are about taking or buying a house, or building one for themselves or others.

In selecting a house, or the site for a new one, remember that where the sun will shine on the house for some hours a day, one element of good is secured, especially if the sunshine enters at the windows of the living-rooms, or rooms most used during the daytime. After the aspect has been found to be suitable, and that a plentiful supply of sun and air is insured, attention should be given to the general position and construction of the house. If the ground is at all porous, a layer of concrete not less than six inches thick, and composed of cement or lime and broken bricks or gravel, should be spread over the whole of the ground covered by the building. This will prevent the passage of ground-air up through the floors. Air will travel through the ground for some distance, and, as it invariably becomes contaminated by taking up carbonic acid gas in its passage, is not suitable for inhaling. The house acts as a sucker on the ground; and if, unfortunately, the site is one on 'made' ground—that is, composed of all the refuse of a town—the ground-air becomes the medium of disease. No houses should be built without a well-ventilated air-space between the earth and the ground-floor, especially if the layer of concrete on the surface be omitted. The walls should be built of good hard-burnt bricks or non-porous stone set in lime or cement mortar. Common under-burnt bricks or porous stones hold moisture, which evaporates with a rise in the temperature, and so chills the air in the house. If the bricks or stones of the walls are suspected of holding moisture, the whole of the external surfaces should be covered with cement, or tiled or slated above. The foundations of the walls should rest on thick beds of concrete bedded in the earth; and to prevent the ground-damp rising up the walls, a damp-proof course of slates in cement or a bed of asphalt should be laid in the full thickness or width of the wall just above the

## HEALTHY HOMES.

BY A SURVEYOR.

THE study of health is now elevated to the position of a science, and everything tending to promote good health in individuals or communities is welcomed. Since the study of sanitation commenced in real earnest, some years since, the most conclusive proofs of the benefits following the adoption of suggestions of the early sanitarians are the decrease of certain diseases, and the consequent diminution of the death-rate.

ground-line. Dryness in this climate is so essential to health, that any building which in its floors walls or roof, sins by admitting moisture, should be rejected as a place of residence by those who value their health. In tropical climates, buildings are constructed to keep out the heat; but here, we build to retain the heat and keep out the cold.

The roof of a house is sometimes a most troublesome feature. Usually, the trouble is caused by some scampish action of the speculator who built the premises, and by the saving of a few pounds to himself, causes the expenditure of money and trouble to rectify his neglect. All roofs should be formed with slopes to a good pitch, not less than thirty degrees for slates, or forty degrees for tiles. It is no unusual thing to find speculators' houses with slopes as low as twenty degrees on the roofs. The joints between the tiles or slates and the parapet walls and chimney-stacks should be covered with lead or zinc tucked into the joints of the brickwork, or into grooves cut in the stone. The ordinary builder's style is to cover the joint with a fillet of cement, and for out-buildings this may do, but never for dwelling-houses. The iron gutters at the eaves of the roof should be cleaned out once a year, as also the lead or zinc central gutters. All sorts of disagreeable things collect in these gutters, and if not carried by the rain down the pipes into the drains, stick in the sooty mud, and cause obstructions and overflows. The pipes from the eaves to the drains should be of metal, iron, or lead, and quite disconnected from the drains by discharging the water over a trapped gully at the end of the drainpipe. Rain-pipes connected immediately with the drains are really vents for sewer-air, and occasionally puffs of this deleterious gas may find its way in at attic windows, if the old-fashioned method of connecting the rainpipe with the drains is in force.

After having examined the shell of the house, the plan deserves consideration, and here but little advice can be tendered, as individual peculiarities demand peculiarities of plan in a residence. The kitchen offices should be pleasantly placed, and not, as in so many old houses in towns, buried away in a basement. Condemn once and for all any house having rooms for living in below the level of the outside ground, especially if the soil be clay; nothing but ill health and depressed spirits can result from the use of rooms so situated. See that the air has free passage through the house, and that the staircase and passages are well lighted; and while noticing the light on the staircase, see that there are flat landings, instead of what are technically known as 'winders,' where the stairs turn. Each room should have good-sized windows, fitted with sashes which run up and down, in preference to casements, which are hung on hinges. With sash-windows, a better control of the admission of air can be maintained, provided both the sashes are hung. Sometimes the top sash is fixed, especially in old houses. This should be altered, as if only the lower sash is hung, a stagnant body of air will hang about the upper part of the room and cause many a headache. Under ordinary conditions, the

wood-sashes fit so badly that a plentiful supply of fresh air is admitted; but if the air is found vitiated in a room, a simple means of admitting more air without draught can be managed by substituting, for the narrow bead nailed on the top of the wood-sill of the window-frame, a piece of deal about three and a half inches deep; by this means the lower sash can be raised three inches without causing an opening at the bottom, as would be the case if the ordinary narrow bead were on the sill. This causes an opening at the point where the upper and lower sashes meet, and so a current of air is admitted, and by entering at the meeting-rails—as they are called—gets deflected up towards the ceiling, instead of pouring in, in a horizontal direction.

Ground-draughts are frequently caused by the bad fitting of the floor-boards. Notice whether the joints between the boards are wide or narrow, and that the skirting fits tightly down on to the floor. Many colds may be prevented by having the joints between the floor-boards filled in with narrow slips of wood or putty.

If the walls of the rooms are papered, determine if possible whether the colours on the papers are arsenical. If you doubt them, have the paper varnished, or, better still, strip it all off. Remember that green is not the only colour in which arsenic is used, but that in others, such as pearly gray, it forms with some makers a large element. In ordering papers for repapering, ask for *non-arsenical* coloured papers, and receive a guarantee with them that they are such. The air we breathe should be as free from contaminating matter as possible, and by having non-arsenical paper on the walls, one great source of contamination is avoided.

Another and very insidious contaminator of the air in rooms is the ordinary gas-fitting, whether chandelier or bracket. Chandeliers which slide up or down are the greatest sinners, for the packing which is supposed to keep the telescope air-tight, is, after some years' wear and tear, often found very defective, and allows the gas to escape and mix with the air of the room. Ascertain whether the pipes conveying the gas from the meter are composition or iron; in old houses, composition tubes are the rule, and these have been found at times eaten away in places by rats or mice. Iron tubes are the best, but with these it is necessary to see that the joints are well stopped with red-lead and painted. Another source of danger is sometimes found where an old gas-fitting has been removed and the tube simply stopped with a plug of wood. This invariably means leakage. Remove the plug, and put a metal cap screwed on with red-lead in the thread, and so prevent risk.

The means of storing water and the supply to the various parts of the house will require very careful examination, as upon the purity of the water will depend the health of the family. When the water is received from a Water Company, the quality is usually sufficiently good for drinking purposes, and it is the duty of the householder to see that it does not take up deleterious matter after leaving the main pipe of the Company. The storage tank or cistern, which as a rule is placed at the highest point of the house, and frequently in the roof, should be either of iron or slate, and of these, iron

is the better, as a slate cistern is more liable to leakage. Cisterns made of wood and lined with lead or zinc are not good, and if the water stands in them for any considerable period, must take some of the metal in a soluble form. All cisterns require cleaning at stated periods, and if lined with zinc or lead, care must be taken not to scrub off the surface of the metal. Where the cistern is in the roof or in a large open space, a cover is necessary, to prevent dust or other impurities from finding a resting-place in it. The service-pipe for the house is taken from the bottom of the cistern, and it will be advisable to trace this and its branches down the house, to discover whether any damp patches on the walls or ceilings are caused by leaky joints.

The water supplying the water-closets should never be drawn direct from the cistern to the pan, but should be delivered into a smaller cistern in the water-closet, holding about two gallons, and this should discharge the whole of the water in it every time the handle is raised. A good siphon form is the best. The taps over the sinks should be of the screw-down kind, as, although they are a little more troublesome to use, there is less chance of wasting and less liability of leakage. It is a good plan to put a stop-valve on the service-pipe from the cistern, to shut off the water in case of leakage in any of the branch pipes or fittings. The wastepipes from the scullery and other sinks should not enter the drains, as, if they do, sewer-air is sure to find its way into the houses; but they should be cut off just outside the wall, and bent to discharge over a gully fixed in the paving, and up to which the drain-pipe is laid. If a puff of sewer-air is driven up the pipe connected with the gully, it will harmlessly die away in the open air, instead of finding its way into the house through the wastepipe. The wastepipe from the bath should be treated in a similar manner, by being cut off from the drains, and a copper or brass flap should be fixed on the exposed end of the pipe, to prevent draughts or insects finding their way up.

The water-closets require very careful examination, and especially their connection with the drains, which is not always visible. The apparatus should be one with few, if any, moving parts except the handle and wires for working the water-supply. The pans known as wash-out or flush-out are very good, their worst fault being a tendency to retain substances, instead of allowing all to be cleared out with one discharge of the small cistern. The soilpipe should be fixed on the outside face of the wall, and not inside the house, especially if it is of iron; a mere pin-hole in the iron will allow the foul air to escape; and the joints, if not properly cemented, will also provide an escape for foul air. The soilpipe is connected at the end with the stoneware drain, and the junction should be so made that the change of direction from the vertical to the horizontal is easy, and not a sharp angle, where deposits may accumulate. The upper end of the pipe should be above the eaves-level of the roof, and either left open or finished with a fixed ventilating cowl. A simple cross or T piece of pipe is quite sufficient for the purpose, with copper

wires fitted in the open ends, to prevent birds building their nests in the pipe. Sometimes the water-closet and bathroom are one apartment, and provided the water-closet is a good one, and the soilpipe properly ventilated, the arrangement is not a particularly evil one. But the wastepipe from the bath must not be allowed to enter the soilpipe, nor must it be connected with the drain, but should be carried down the outside wall to a gully, over which it should discharge. Every water-closet should be fitted with a window or skylight communicating with the outside air, and the window or skylight should always be kept open a few inches. The simplest bath fittings are the best, and should always include a tap for hot water. The screw-down kind are less liable to leakage.

The drains which lead the water and refuse-matters from the waste and soil pipes to the main sewers require to be examined, as far as their buried state admits, with great care, as upon the efficiency of the drainage system the health of the household will to a great extent depend. These drains being hidden away underground, are not, as a rule, put together with the care and accuracy which their importance demands. Any labourer on a building is, in the opinion of the speculating builder, competent to lay drains; and to this individual's—and his employer's—skill or want of skill may be attributed much of the disease generated through breathing sewer-air. A drain requires as much care and forethought in its construction as any other piece of workmanship. The pipes should be laid in as straight lines as possible; and where bends or changes of direction are necessary, they should be easy and of long radius, formed with bent pipes, and not made up with straight lengths. Where the pipes pass under the house, they should be laid in a bed of concrete, and the joints well cemented on the outside. The fall of the pipes from the highest point to the sewer should be gradual and even throughout. A fall of from two to three inches in ten feet is the general rule for ordinary house-drains, and will be found ample if the pipes are properly laid. The diameter of the pipes used is usually much too large, six-inch pipes being used where four-inch would do all the work. A drain to be well flushed should run half full at least, and this cannot be attained if the pipes are too large.

All junctions of drainpipes should be made with proper junction-pipes, and not by simply cutting a hole in the side of the pipe for the entrance of the branch. At some point on the drain near its entrance to the sewer, a stoneware siphon trap should be fixed, for the purpose of keeping the sewer-air back from the house-drains; from the top of this trap, a ventilating pipe should be carried to the nearest wall, and continued up to above the level of the eaves of the roof, so that any foul air which gets driven through the trap may find its way up above the roof-level, and so out of harm's way. Always learn from the builder of the house, or some person possessing the knowledge, the course and position of the drains, and where they are connected with the sewer. The information will be worth having; and if a rough plan is made up from the information, and kept handy for reference, a bad smell will soon be

traced out and stopped. If an unpleasant smell is perceived, never rest until the cause is discovered. Do not risk the chance of an attack of diphtheria or typhoid, by allowing the evil to exist. Attack it at once; hunt it to its source, and provide a proper remedy. Do not run away with the common idea that sanitarians exaggerate evils, and that, because our forefathers were content to live under certain conditions, we should follow in their footsteps. Times are changed; new conditions have produced new evils; and it is the manifest duty, as it should be the pleasure of the parent of to-day to provide as healthy a home for his family as his pecuniary means and position in life will allow.

#### A NIGHT-HALT.

I DON'T think that contributors to this *Journal* realise how widely spread an audience they are addressing. Copies of the great English periodicals turn up in every corner of the world, often remote from civilisation, and unable to account for themselves, but not the less welcome to their discoverers. So, when, on an abandoned campground in the Great Lone Land, I found a torn damp leaf from *Chambers's Journal*, and at the foot of one page a notice to contributors that was in its manner kindly, I had courage to think that perhaps the great audience might like to know what manner of camp it was, and that travellers in distant lands and on remote oceans would be interested.

The Canadian North-west is not peopled with very savage races, nor is it wholly unexplored, like some parts of the empire; there are villages every two hundred miles or so, and trails between them good or bad according to season. There are wide tracts where the houses are in sight of each other; and all over the plains the survey-marks and buffalo bones lie together. Sometimes the trail for many days' march is over plains level as the sea, or rolling land verdureless and stony; sometimes the country is like a stormy ocean, with all the hollows planted with scrubby bushes, or filled with stagnant water, with meagre reeds and alkaline deposits. Large areas are covered with hills; but rarely, and as a great treat, one encounters running-water in a deep ravine. English readers will hardly realise the beauty of running-water in a land where good springs are as scarce as opera-houses.

A stream called Eagle Creek has cut a ravine some two hundred feet deep in a stony plain near the North Saskatchewan, and carved the banks into a medley of grotesque and isolated mounds, strewn with boulders, and nearly void of grass, whose steep and eccentric shapes give the view from the bottom a most singular and impressive contour. The stream itself has evaporated, and left one or two miry ponds, whose stagnant waters feed the few and small shrubs that adorn the bottom; and beside them is a space of half an acre of pleasant grass, with many round patches in it, traces of fires beside which passengers on that lonely way have been wont to rest. How wagons get down the trail to the bottom is marvellous.

The sun has set behind the hills towards the

north-west; the wind is sinking; the foxes are running about, and a crane stands in the troubled water and looks melancholy. A cloud of dust behind the hills to the east, and the distant tramp of horses, announce that the valley will presently be disturbed; and immediately, a mounted man in a bright cavalry uniform rides to the edge of the hills, and stands out against the sky a beautiful silhouette, motionless as a statue. Then two and two, come twenty mounted men, each with a rifle poised on the horn of his Mexican saddle, and many a glittering point of brass and steel about his harness. At the word of command they dismount, and advance, leading their horses down the slope; and we see behind them five wagons, each carrying two men, and a rearguard of two, who linger behind a bit before they dismount and follow the groaning transport. They are coming nearer now—young, bronzed, and sturdy, their equipment suited to the prairie, but very strange to those who live in cities. One or two wear cavalry breeches, with broad yellow stripes down the sides; but most of them are dressed in dark canvas adorned with brass buttons; and there is a large variety of slouch-hats and western shirts and old red jackets, according to the pleasure of the wearers. All wear riding-boots, spurs, cartridge belts heavily mounted, and big revolvers, with lanyards buckled to the butts and passing over one shoulder.

When they reach the level land at the bottom of the ravine, the mounted men form up in line, and the wagons draw up behind them forty feet apart; a rope is stretched along the line of wagons; and leaving the saddles on the first line, the horses are attached to the rope almost as soon as the teams are unharnessed. Two or three men select a spot by the bushes, where an iron bar is quickly set on uprights five feet apart; and before the sound of the axes has ceased in the bush, three heavy camp-kettles are swinging over a roaring fire. A bell-tent is pitched for the officer in command; the horses are watered, groomed, and fed; and at a last merry order from the bugle, there is a general dash for plates and cups; and knives drawn from belts and boot-legs are ready for an astonishing slaughter of pork and hard-tack. The latter is the western name for that which is known elsewhere as ship-biscuit, and it is partaken in company with strong and hot tea around the camp-fire. The meal is accompanied by an uplifting of blue smoke into the clear sky, and there is a lively fire of chaff in good American and even British dialects. After a decent interval, the horses are hobbled or picketed for the night, and a guard of three men placed on picket duty until sunrise. Blankets are spread out along the saddle-line and in and under the wagons; and before the sounding of the last of three beautiful evening 'calls' has awakened the echoes of the sterile hills, conversation has flagged, and there is silence under the starlight.

The horses are pulling at the grass, roving about, and clanking their hobbles; and the man on duty stands by the fire or glides about among them; and overhead the stars are blazing in heaven, and the dim white aurora is flitting in the north. Then the stars and the aurora pale, and the north-east glows with rose and orange, and the wind wakes up, and the soft

mists rise. Startling all the echoes, making the keen air tremble, waking the summer world, and losing coherence in the distant sky, reveille rings out clear and sharp, a burst of triumphant unexpected music—and the night is gone. Then to successive bugle calls, blankets are rolled, wagons loaded, the horses carefully tended, and breakfast finished; and ere the sunlight warms the ravine, the mounted party is toiling up the hillside, and the wagons are following across the narrow bottom.

Such is a night-halt of a party of Mounted Police under the pleasantest conditions, and while travelling at about forty miles a day. But there are no members of the Force of over a few months' standing who have not travelled *without* night-halts, or under conditions of hardship that it would be difficult for an English reader to realise. Although the statement little accords with those of emigration agents, the climate of many districts is extremely rigorous; and although this does not detract from the value of the crops, the cold is so great in December and January that even an emigration agent would not willingly travel during those months in any part of the Territories. As pioneers preparing for the advance of civilisation, the Mounted Police undertake to suffer discomfort and to perform duties of unexampled difficulty, without the performance of which, the new provinces of the western plains must be, as they were before the white men came—a howling wilderness.

### ODD WAYS OF PUTTING THINGS.

CURIOUS ways of expressing ideas in English may be expected from foreigners, as, for instance, when the Frenchman, who paid a call in this country and was about to be introduced to a family, said: 'Ah ze ladies! Zen I would before, if you please, wish to purify mine hands and to sweep mine hair.'

But the various nationalities of the British Isles are sometimes not a whit behind in verbal bulls and blunders, and in what may generally be described as odd ways of putting things. It is said that when Constable's aunt was dying, the good deaf old lady said: 'Anne, if I should be spared to be taken away, I hope my nephew will get the doctor to open my head and see if anything can be done for my hearing.'—A Paisley publican was complaining of his servant-maid that she could never be found when required. 'She'll gang out o' the house,' said he, 'twenty times for ance she'll come in.' It must have been a relative of his who aroused her servant at four o'clock with: 'Come, Mary, get up. Here 'tis Monday morning; to-morrow is Tuesday; the next day's Wednesday—half the week gone, and nothing done yet.'

Taffy often plays amusing pranks with the Queen's English. A Welsh landlord, who for some time had been annoyed by an obstreperous guest, walked across the room to him, and striking the table with his fist, shouted very volubly: 'You haf kick up a row all day here to-night! We was not interfere with you, do we? Ebery man here mind his own pizness; yes, by Jing! no.'

Pat of course is proverbial for his eloquent if rather novel and puzzling ways of putting things. A retired army surgeon in the north of Ireland

had a humorous experience of this when often visited by the neighbouring peasants, who were anxious to avail themselves of his good nature and professional skill. One applicant for relief described himself as having 'a great bilin in his troat, and his heart was as if ye had it in yer hand and was squeezin' at it.' 'Plase, yer honour,' whined a barefooted woman, 'I'm in great disthress. I fell down yesterday and broke five of me ribs, an' for the blessing of God, could ye spare me a trifle?' Another patient said: 'Savin' yer honour's presence, me shtomach has gone to the wesht of me ribs.' A traveller being on the box of an Irish mailcoach on a very cold day, and observing the driver enveloping his neck in the voluminous folds of an ample 'comforter,' remarked: 'You seem to be taking very good care of yourself, my friend.'—'Oh, to be sure I am, sir,' answered the driver; 'what's all the world to a man when his wife's a widdy?'

Such specimens of the bull genus, however absurdly expressed, generally seem to convey the intended idea in a pithy and forcible manner, quite unlike the following, which, for concentrated inaccuracy of statement, can hardly be surpassed. This sentence occurred in an account of a burglary in an Irish newspaper: 'After a fruitless search, all the money was recovered except one pair of boots.' A recent critique upon *Othello* had the following: 'The Moor, seizing a bolster full of rage and jealousy, smothered her.'

The beggar was verbally mixed who thus accosted a passer-by: 'Sir, would you please give a little money to buy a bit of bread, for I'm so dreadfully thirsty that I don't know where I am to get a night's lodging.' The same may be said of a country yokel who went to a menagerie to examine the wild beasts. Several gentlemen expressed the opinion that the orang-outang was a lower order of the human species. Hodge did not like this idea, and striding up to the gentlemen, expressed his contempt for it in these words: 'Pooh! he's no more of the human species than I be.'—'Mamma, is that a spoiled child?' asked a little boy on seeing a negro baby for the first time. Another small boy while at play in a garden saw a black snake gliding through the grass. It was the first one he had ever seen. He became greatly excited over it, and rushed into the house crying out: 'Mamma, mamma! there's a tail out here runnin' along without nussin' on it.'

A little girl had been told by her nurse that if she did not think so much by day she would dream less at night. 'But I can't help thinking,' she said; and added pathetically: 'I cannot make my mind sit down.'

'Could you show me the way to the cathedral?' asked a stranger. 'Turn round that corner and inquire for the glove shop; the cathedral is close by,' was the odd reply of the intelligent native thus accosted.

The English naval officer who wrote to the Admiralty, 'My Lords—I have given the French a good drubbing,' had an odd but laconic way of composing his despatches. More curious was the regimental order issued by a Hibernian colonel, which ran thus: 'Colonel Haggerty desires it to be distinctly understood that no

passes for over twenty-four hours will be granted to the men unless written application is made for three days subsequent to the time the pass is wanted. Any man who applies for a pass and does not make use of it, must, before proceeding out of barracks on leave, or immediately he returns from leave, report that he wishes his pass cancelled to his pay-sergeant, else his indulgence will be stopped prior to the date of any such offence for a period of three weeks.'

There was something quaint in the programme of the Flower Show of the Society which promotes window-gardening. The flower show, says the programme, 'will take place (D.V.) by permission of the Dean.' It was a thoughtful thing to translate, for the benefit of the working classes, the words indicated by D.V., *Diacono volante*, by permission of the Dean, a cheerful play upon capital letters.

An amusing announcement was issued by a corn-cutter from Liège, living at Spa: 'They extrect the corns vidout the slitest pain. Cutt nales deformed vitch spreeds in the fleisch—by a new methode vidout pain. They spokes French, English, Italian, Spanitch, Portogeesse, Dutch, and Garman, vid equal fluency, and rites dem.'—Over a bridge in Georgia is the following: 'Any person driving over this bridge in a pace faster than a walk, shak, if a white man, be fined five dollars, and, if a negro, receive twenty-five lashes, half the penalty to be bestowed on the informer.' In a small town near Avignon, the houses in the suburbs became flooded up to the level of the first floor. An enterprising resident distributed among his neighbours the following card: 'M. Brochet, Professor of Swimming, is prepared to give lessons at the pupil's residence.' The Professor may be said to have taken fortune at the flood.—A shop in Cheapside exhibits a card warning everybody against unscrupulous persons 'who infringe our title to deceive the public.' We are afraid the shopman does not quite say what he means, any more than the proprietor of an eating-house near the docks, on the door of which may be read the following announcement, conveying fearful intelligence to the gallant tars who frequent this port: 'Sailors' *vitals* cooked here.'

A boarding-house keeper announces in one of the newspapers that he has a cottage to let containing eight rooms and an acre of land.—A dealer in cheap shoes was equally ambiguous when he counselled in one of his advertisements: 'Ladies wishing these [cheap shoes] will do well to call soon, as they will not last long.' The same may be said of the following: 'This hotel will be kept by the widow of the former landlord who died last summer on a new and improved plan.'—A circular advocating a summer resort, calls attention to numerous cosy seats in forked trees and elsewhere—some of them just large enough for two persons. A manufacturing wire-worker invites the public to come and see his invisible wire fences.

An odd way of putting things is to describe a turkey as a red-nosed chicken with a large bustle—the definition of some smart wag. Affectation is defined as petty larceny in the abstract; and a lawyer of large experience says the art of civilisation is getting your neighbour's money out of his pocket and into your own without making

yourself amenable to the law; while an editor defines a certain kind of philanthropist as a zealous person bent on doing the greatest possible good to the greatest possible number with the greatest possible amount of other people's money.

Human efforts to achieve certain aims have been likened to a dog trying to catch its tail. Just as we think we are about to succeed, away goes the tail.

'What a recreation it is to be dying in love,' exclaimed a love-sick Hibernian. 'It sets the heart aching so delicately that there's no taking a wink of sleep for the pleasure of the pain.' A Scottish blacksmith being asked the meaning of metaphysics, replied: 'When the party wha listens disna ken what the party wha speaks disna ken what he means himsel'—that's metaphesica.'

Perhaps as odd a way of putting things as any of the foregoing examples was furnished by a little Parisian mendicant, who, following a gentleman, said: 'Monsieur, give me just a penny. I'm an orphan by birth.' The definition was worth ten centimes to her.

## THE METALS SODIUM AND POTASSIUM.

### A NEW PROCESS OF MANUFACTURE.

THE announcement of Mr Castner's new process for the manufacture of these metals has taken the chemical and commercial worlds completely by surprise. The advantages claimed for that process were at first doubted, and many and strong were the expressions predicting its failure. Now, however, that it has become better known, it is admitted that applied chemistry has achieved another and most signal triumph. All that has been said in its favour has been fully realised, and we are now assured that the prices of sodium and potassium will in future be one shilling a pound each, instead of, as formerly, four shillings a pound for sodium, and sixty shillings for potassium. So great a diminution in the cost of production is not frequently made nowadays; and commerce and industry are sure to reap enormous advantages.

In the old process of preparing these metals from their carbonates there were great waste and great risks of explosion. These, especially in the case of potassium, made the process an expensive one. The cost for retorts alone, which were necessarily of wrought-iron, amounted to no less than fifty per cent. of the whole.

There is no risk of explosion in the new process, so long as the materials are used in the proper proportions; the temperature required for the distillation is only eight hundred degrees centigrade, or six hundred degrees less than in the old process; attention to so many minute details is not necessary; there is hardly any waste; and as the temperature is so much lower, the retorts last a much longer time. In this process the metals are prepared from their hydrates. There is nothing exactly novel in this, for Gay-Lussac and Thénard so long ago as 1808 prepared potassium

by running a slow stream of the fused hydrate over iron turnings heated to whiteness. Their method was not successful on the large scale. Castner's differs but slightly from it; but that slight difference is the wide interval which separates success and failure. Castner found that a combination of iron and carbon acting together reduced the hydrates to the metallic state with comparative ease.

He prepares his reducing agent in the following way: The mineral known as 'purple ore,' which is an oxide of iron, is heated to a temperature of five hundred degrees centigrade, and at the same time a mixture of two gases—carbonic oxide and hydrogen—is passed over it. The result is that the oxide of iron is changed into metallic iron, which remains in the state of a fine powder. This powder is then intimately mixed with melted pitch, and the mixture allowed to cool. It is next broken into lumps about the size of bricks, and these bricks are heated in large crucibles and converted into coke. This coke is found to contain a definite quantity of iron and carbon, which cannot be separated again by mechanical means. The coke is next powdered finely, and added in proper proportions to the hydrates of potash or soda, the mixture placed in a retort of cast-steel or cast-iron, and gently heated for about thirty minutes. This causes the mixture to fuse and give off large quantities of hydrogen gas. When the bulk of this gas has disappeared, the reaction proceeds with less violence; and the retort is then placed in a hotter furnace, where the temperature soon rises to about eight hundred degrees centigrade. The sodium and potassium distil over very quickly, and in about ninety minutes the operation is complete. Great care is taken that no carbonic oxide gas shall be produced during the distillation of potassium, as this gas is the cause of the formation of the explosive compound. Analysis of the gas evolved shows that this is practically possible without adopting any other precaution than that of using a quantity of the coke slightly less than the theoretical amount. The cost of retorts is estimated at twopence a pound on the yield of metal, as compared with two shillings a pound in the old process. This is an enormous saving.

The general public know very little about sodium and potassium. They have seen but little of them in the past, and may not see much more of them in the future, even at the reduced prices. The fact is that these metals do not possess the properties which fit them for general use. They cannot be exposed to air, nor can they be handled. Nevertheless, they are of very great value to the chemist by reason of these very drawbacks. That they will be largely used in the preparation of aluminium, magnesium, and silicon, is certain. In aluminium, we have a metal of considerable commercial value, extremely abundant, but extremely difficult of preparation. It is white like silver; it does not oxidise or tarnish in the air; it takes a die well, and is therefore useful for medals or coins; and with other metals it forms alloys of great practical importance. Owing to its high price—about fifty or sixty shillings a pound—it has not been much used in the past; but with sodium at one shilling a pound, the estimated

price of aluminium is twenty shillings a pound. On the whole, aluminium promises to be a valuable metal; but its uses will not be fully known until it can be manufactured at less cost than at present.

The demand for aluminium will be so great that the profits from the manufacture of this metal alone will yield Mr Castner a handsome return; and while it is difficult to foresee the many industries that may be affected by his invention, it may safely be said that a more valuable addition to manufacturing chemistry has not for a long time been made.

#### THE MYSTIC MUSIC OF THE SHELL.

Bright crimson bars flecked all the west  
With deeper glow than molten ore;  
The soothing, sober hour of rest  
Crept o'er the haven on the shore.  
O'er cliff and vale athwart the land  
Floated the sound of evening bells,  
While all along the shining strand  
Glad children gathered shells.

A simple, laughing child of three  
Long held one to its eager ear.  
What glowing, wondrous mystery  
Did it in soothing murmurs hear?  
Was there recalled the dream of heaven  
Which its pure spirit knew of yore,  
But which at its birth-hour was riven,  
Here to be seen no more?

A sailor's rosy boy of nine  
Placed to his ear the self-same shell.  
What made his face so gladly shine?  
What tale of wonder did it tell?  
He saw fair isles in emerald seas,  
And felt the fragrance of the air,  
And bright song-birds on stately trees—  
He sighed and wished him there.

Along the margin of the sea  
A youth with shining face there came,  
His soul steeped in love's mystery,  
And breathing oft a dear one's name.  
The shell sang to his yearning ear  
That song which all the spirit fills;  
And on his soul her voice fell clear  
From o'er the sundering hills.

An aged man with silvery hair  
Came slowly o'er the gleaming strand;  
With faint smile on his face of care  
He took a smooth shell in his hand.  
No song for him of emerald seas  
It sang, but breathed of woe and pain:  
He heard sad voices in each breeze,  
And sighed for youth again!

## THE GLORY OF THE YEAR.

'WITH what a glory comes and goes the year,' The glory of early autumn, when the wealth of summer verdure has felt the rays of the vertical sun and solstitial heat, under which the leafage has become tinted with an infinite variety of glowing colours. The glory of the clustering trees in wood and thicket—the deep crimson-tinted ash, and faintly yellow leaves of birch and sycamore, the deeper-hued elms, and rich purple-brown of the copper beech. The glory of the warm amber light of the sun on the billowy clouds and dim distant hills, and over the broad fields of ripening grain or golden sheaves of corn, the long swaths of bearded barley and glistening oats. The glory of ripe fruits, of purple plums and luscious damsons, juicy brown pears and ruddy apples, of clustering grapes and ripening blackberries.

The glory of the 'breathing freshness' in the morning air, and calm serene beauty of the long golden twilight, that floods 'hill and valley, lake and sea.' The glory of the broad red moon, rising over the limpid, rippling river, or gently surging sea, throwing a wide track of light before. The glory of the merry, sun-kissed faces of little children on the shore, where the iodine-scented breeze has tinged their cheeks with life and health. The glory of the richly coloured flowers, the scarlet poppies, the velvet champions, the deep blue of the corncockle, the late 'pure pale marguerite,' the yellow marigolds and sturly thistles, with their rich purple heads and prickly stems, round which twine the frail pink-veined bindweed.

The glory of deep brown pools and translucent streams, along whose banks is a lush growth of herbage, from which rise the fragrant, feathery meadow-sweet, the water-arrowhead, purple loosestrife or 'long purples,' and red hemp-agrimony. Side by side are azure-eyed forget-me-not and pungent peppermint, broad-leaved silver burdock and wild mignonette. The amber and white water-lilies reflect their rose-shaped blossoms in the

still water-mirror on which they float surrounded by their glossy green leaves; and under the thick tufts of graceful cat's-tail, or reed, and all the lovely waving grasses, lurk the shy trout, where myriads of flies and gnats are hovering and dancing in the air, and darting swifts divide the light ephemeral spoil with the low-skimming swallows.

The glory of the year seen on the wild moorland, with the rosy-purple heaths and the delicious fragrance of wild-thyme. On the wild roadside and uncultivated land, by the white and pink tinted blooms of the hardy yarrow, with its dark-green serrated foliage; the yellow rock-rose with its sensitive petals and glossy leaves; the blue succory in the hedgerows, the trails of deep purple nightshade and bunches of round orange berries. Amongst the late young grasses grow the fragile blue harebells—bells fit for ringing fairy music by the breath of the evening zephyrs. The pale yellow and deep amber hawk-weeds creep about the stony heaps, and brighten the dry pastures, adding to the glory of the year, when Ceres and Pomona unite to show the maturity of natural production, and the beneficent fruitfulness and affluence of the earth.

The warm radiant sun lifts the moisture from the earth; and in the early morning hours is seen the glory of millions of sparkling dewdrops upon hundreds of acres of frail silky cobwebs, stretching along every fence and hedgerow, and festooning every flower and tree, lending a softer, fairer glow to the masses of autumn foliage—cobwebs of such fineness as to be almost unseen and intangible, light enough to float in the air; yet a few steps forward and they strike across the face, and before you are aware, every vestige is gone—where? Who can tell? Two or three misty mornings come in succession, and the clouds begin to gather from afar, rising under the blue illimitable sky in soft shiny, billowy masses; anon towering high in the noonday sun, and being drawn insensibly eastward by some motive-power unfelt, unseen, and almost disappearing

from view, to rise again, later in the evening, in thunderous masses, dun, purple, and copper coloured, with intense bright orange-tipped edges, behind which shoot long straight rays of light from the glory of the setting sun, which fades and deepens as the twilight shadows creep over the sky. The air is still and breathless; the doors and windows stand wide open, letting in the scent of late flowering mignonette. Now and then, a fitful gust of wind sighs through the trees and scatters the leaves on the darkening air.

The light is fading down the sky,  
The shadows grow and multiply—  
I hear the thrushes' song.

Perched on the highest tree, this shrill-voiced 'storm-cock' foretells the coming storm. As the big red disc of the full moon rises over the far stretching hills, broad gleams of summer lightning rise from behind those dark billows of dun-coloured clouds, streaming vividly in all directions from right to left, darting along the cloudy horizon in all shades of light—faint yellow, rosy red, intense steely blue, and lurid crimson, leaping from point to point in a wild weird dance of instantaneous brilliancy. Then the eyes grow weary of watching, and the first hours of the night are passed in a deep dreamless sleep, to be suddenly awoken from unconsciousness of being to intense consciousness of listening, though with still closed eyelids. What is it? A long, low, heavy sound reverberates in the distance, another and another, then a pause. In the dense gathering darkness of a coming storm, the vivid flashes of lightning seem very different from what they were three or four hours ago; nearer and nearer rolls the thunder; then a startling, rattling crash follows, and a sudden gust of wind dashes the leaves and big sharp drops of rain against the window; then, with a heavier crash, the clouds open and comes the welcome rain, softly falling for a few minutes, ending with a drenching downpour; and the subtle scent of refreshed herbage reaches the senses. The storm dies away in the distance; and the clouds break and disperse; the waning moon shines fitfully and with a watery light, in the coming early dawn.

The following morning is full of blithe gladness and soft scents; trees and flowers are refreshed; the mountain ash tosses its clusters of red berries in the sunshine; the corncrake is heard here and there in the clear morning air; and the plaintive song of the finches and musical *roulade* of the robin come from the shrubs and low bushes near the house.

Soon the glory of the year, the

Season of mist and mellow fruitfulness,  
Close bosom-friend of the maturing sun,

will be over; even the latest flowers will have faded, and given place to the seed capsules, that in due time will swell and ripen and replenish the earth—in their turn to bring forth the glory of the fair springtide.

As the days creep on and shorten, the golden glory fades from the twilight, and deeper shadows

rest on the dun-coloured clouds, yet still we can say :

Ah, what a glory doth the world put on  
For him who with a fervent heart goes forth  
Under the bright and glorious sky, and looks  
On duties well performed and days well spent.

## RICHARD CABLE,

THE LIGHTSHIPMAN.

### CHAPTER XLII.—SEVEN RED WINDOWS.

A CURIOUS sight it was to see Cable breaking stones on an early summer day, with his children about him, sitting on the heap, playing in the road, crouching into the hedge, and at noon clustering round him whilst he divided among them the cold potato-pasty that constituted the family dinner. But it was on Saturday only that this little conclave assembled, when there was no school. On all other days the elder children were learning their letters and the art of sewing in the National School. The winter had passed hardly for Richard Cable, and for his mother, who had become infirm with age and trouble. She did not complain; but her face was paler and more sharp in feature, her movements were less rapid, her hair had become grayer. A tree ill bears transplantation, and Bessie had been uprooted from a comfortable home, from associations sad, painful, and yet cherished as associations, and carried away to a strange corner of Britain, where she was subjected to hardships to which she was unaccustomed. The work Richard got was not such as to bring in much pay, and it was not work for an able-bodied man. Sometimes he sat on the side of the road against the hedge and broke stones with a long hammer; at others he hobbled about the road scraping it and cleaning the water-run-lets. He got very wet over his work, and then rheumatism made itself felt in his weak thigh.

One consideration troubled Richard Cable night and day, and the trouble grew as the children oldened. How could the cottage be made to accommodate them all when they were grown up? How could his scanty earnings be made to sustain the whole family when the children were young women and exacted more of him? Would he be constrained to send his daughters into service? The notion galled him. He racked his brains to discover what situations would be suitable for them, and how they could be guarded from harm when in them, away from their grandmother's watchful eye and his protecting arm. He could not endure the thought of his darlings separated from himself and from one another, dispersed among farmhouses, surrounded by coarse associates, hearing loose talk, seeing unbecoming sights. He dreamed of his Mary or his Martha or Effie in such associations, and woke, flinging his arms about, crying out, leaping from his bed to throttle those who thus offended his little ones.

As he sat breaking stones, sometimes the mica in the stones glittered in the sun; he wondered whether he should chance on a nugget of gold or a thread of silver, and so make his fortune. But such an idea, when it rose, embittered him the more. No; there was no chance of his finding gold thus; for that, he must go to California, and that he could not do, because he might not

leave his helpless children. Silver! If he lit on a vein, what would it profit him? Others would enter in and quarry the precious metal; the mining captain, the men, the lord of the manor, the shareholders, would reap the silver; not a coin minted out of it would come to his pocket who discovered the lode.

All at once Richard Cable left the parish church of St Kerian and attended the Wesleyan meeting-house. What was his reason? It was no other than this: The rector had a large family, growing up; they sat in a pew near the beautiful old carved and gilt oak screen; and Cable could not endure to see them there on Sunday, and to listen to the voice of a pastor who was able to retain his eldest daughter, aged twenty-three, in the parsonage; also his second, aged twenty; and his third, aged eighteen. Why should the rector be thus privileged, and he himself be without the means of making a home for his children when they were grown up? The ways of Providence were not equal. He gave up going to chapel after a few months, because he was at war with Providence, after which the chapel was named. He beat the stones to pieces with a vindictive hate, as though he were breaking up the social order and reducing all men to one size and ruggedness. The farmer who was principal shareholder and mainstay of Providence Chapel had built himself a new house. Why should he be capable of adding three new rooms to his dwelling, and he, Dicky Cable, be unable to enlarge his cob cottage without encroaching on his garden?

Then his mind turned back to Hanford. He thought of the Hall that might have been his, had Gabriel Gotham behaved rightly to his mother. He knew that house well now, and he took a grim pleasure in considering how he would have disposed of the rooms for the accommodation of his dear ones. The little Rose Room, that would have done for the twins; and Mary, sweet Mary, should have had the Blue Room looking out on the terrace, with the window over the door. The Yellow Room would have gone to his mother and baby Bessie. Lettice and Susie could have revelled in the Lavender Room, so called because it always smelt of lavender. How happy the children would have been there! How sweet would have been the sound of their voices as they played among the bushes of laburnum and syringa! The idea was enticing; but Richard never for a moment regretted having refused the offer made him.

His brief life in the Hall had left an indelible mark on him other than that which has been mentioned. In spite of himself, he had been forced to contrast the habits of the cultured with those of the class to which he belonged; and his clear good sense showed him that there were vulgarities and roughnesses that might be sloughed away with advantage; that there were merits as well as demerits in civilisation. Involuntarily, his mind was caught by these points, and hung on them, and he began to correct in himself little uncouthnesses, and to insist on attention to these matters in his children. In Bessie Cable there had ever been a refinement and grace of manner above her position, due to her early association with Gabriel and the rest of the Gotham family; but Richard had not regarded this or sought to acquire it. Now he appreciated it, and was pain-

fully anxious that his children should acquire it. Indeed, with them there was no difficulty; they had instinctive delicacy and refinement. They had the look of little ladies, with their transparent skins, fine bones, and graceful shapes.

'You're swelling out of your clothes,' said Farmer Tregurtha one day as he came on Richard sitting on the bench at his cottage door, looking at his children.

'What do you mean?' asked Cable.

'So proud,' answered Tregurtha, laughing—'proud wi' contemplating them seven little mites.'

'And I've a cause,' said Richard, holding up his head.

He could not get over his difficulty about housing the little girls as they grew older. He could not raise the roof and add a story, as the clay walls would not bear the superstructure; and to add to the cottage laterally was to rob his garden.

One night, after Cable had been fuming in mind over this trouble all day, he had a remarkable dream. From his bedroom he could look through a tiny window away to a green sloping hillside, which had its head clothed with dense oak coppice. He had often looked out at this hill and thought nothing of the prospect. This night, however, he dreamed that, as he lay in bed, he was gazing through the window; and although it was night, he saw the whole of that slope and the wood, and the granite tors and the moor clothed in heather and gorse behind it, bathed in glorious sunlight. But what was new and remarkable in the landscape was that, on the slope, where now lay a grass field, standing with its back to the coppice stood Hanford Hall. There was no mistaking the house, with its white walls, and windows painted Indian-red, and the great door opening on to the terrace. There it stood, with its flight of stone steps down the slope in three stages. Moreover, he saw himself standing in the doorway, and one of his children's heads peeping out of each window. There was Mary looking from the Blue Room, and Effie from the Rose Room, and Susie from the Lavender Room, and Martha from the Yellow Room. Only he could not make out whether little Bessie were there, and from which window her dear innocent little face, with its look of pain ever on it, was visible. The house had an air of comfort about it, and a freshness, such as Hanford Hall lacked. It had lawn and flower-garden before it, and gravelled walks; and a summer-house where at Hanford stood the wind-strew, a summer-house with a conical roof and a gilt ball at the top. This was the only completely novel feature in the scene. He knew the St Kerian landscape. He knew the front of the house at Hanford, and of course his children's faces were familiar to him. Why, then, was a perfectly new feature introduced, and how was it that such a jumble of disconnected objects and scenery should occur to him?

When Richard awoke, the dream had made such an impression on his mind that he was unable to shake it off. Only one point puzzled him—the arrangement of the windows. How were they set in front of the house so that there should be seven windows? If he had two on the right and two above, also two on the left and

two above, and one over the door, that would make nine. If he had four on one side and two on the other, and one above the door, that indeed would be seven; but the house would be lopsided. He tried to recall how the windows were at Hanford, and was unable to recollect. All day he puzzled over the problem. As he went through the village, he met the mason.

'Mr Spry,' said he, 'how could I build a house on Summerleaze with seven red windows in the front and a door?'

'Summerleaze!' exclaimed the mason. 'Why, sure, that belongs to Farmer Tregurtha. You're surely not a-going to build there?'

'Never mind about that,' said Cable hastily. 'All I ask is, how can I have seven red windows in the front of a house, with a door to go in at?'

'You about to build!' exclaimed Spry. 'Wonders will never cease! Where is the money to come from? Show me that, and I'll consider the question how to build with it.'

'I want to know how there could be seven red windows in the front of a house, as well as a door, and the front of the house not look crooked and queer?'

'What be the good of puzzling over that, when the land ain't yourn, nor the money itself to build with.' Then he pushed on his way, and left Cable unanswered.

That same day Cable was seated by the roadside. He had broken his pasty into eight pieces; but little Lettice had cried for more, and he had given her his portion, contenting himself with the crumbs. He was hungry and irritable, teased with his dream, and angry at the mason for the contemptuous way in which he had left him with his problem unsolved. All at once he heard a voice above him, and looking up, saw Farmer Tregurtha standing in his field behind the hedge, gazing down on him and on the little shining heads on which the sun was blazing.

'Hulloh! Dick,' shouted the farmer, 'what's the meaning of this I hear? Spry has been talking all over the village that you are about to buy my land of me whether I want to sell or no. I did not know you were flush of money and wished to extend your acres!' Tregurtha had dined; he was in a jovial mood. Cable was empty, and an empty stomach makes a bitter soul.

'I'll telly' what,' said the farmer; 'your little ones will come to a workhouse sooner than to a mansion on Summerleaze.'

Then Cable began to tremble. With difficulty he rose to his feet, and looked hard at the face of Tregurtha—a red, good-natured, rough face. He looked beyond, and saw the green meadow that reached up to the oak coppice, and beyond the coppice rose the heathy moor to the granite tors. Then his eyes fell, and he saw his seven little girls looking up at him, wondering, not understanding what was going on—six pair of blue eyes, only those of Bessie brown like her mother's. Spots of red came on his temples, and sparks danced in his eyes.

'Come, Dicky,' said Tregurtha, 'shall we deal?' And the farmer guffawed.

Then Cable turned deadly white. The laugh stung him. It was insulting, though not intended to offend.

'Come, Dicky, you shall have it for one hundred and fifty pounds.'

'How long will you wait?'

'Ten, twenty, forty years—till Doomsday, when you are like to have the money.' Again Tregurtha laughed.

Then Cable set his teeth, and hardly knowing what he said, he held out his empty hand towards Tregurtha, and cried: 'Wait, wait! I will buy your land; and there, against yon wood, my house shall stand, grander than any in St Kerian, bigger than the parsonage, plastered white, and roofed with slate, and with seven red windows in the front, one for each of my little girls to look out of.'

'All right,' answered Tregurtha. 'May I live to see it—when the world is turned topsy-turvy.' Then he went away.

Cable reseated himself at the stone-heap. He was still trembling. He was in no mood now to speak with his children. 'Run home,' he said to them.—'Mary, take them away; I must return to my work.'

Then Mary held out her hand to Bessie, who could just toddle, and Effie held Bessie by the other hand. Martha took the hand of Effie that was disengaged, and Lettice the free hand of Martha, and Jane that of Susie; and so the seven little creatures walked away, casting seven little shadows on the white road; and Richard Cable looked after them, and when they had turned a corner, covered his face and wept like a woman. When he came home in the evening, he was whistling a tune, to let the little ones suppose that he was in good spirits. He turned out a caldron of boiled turnips and Essex dough-nuts into seven little soup-plates, and seven little stools were set at the table. Cable sat by the fire with his dish on his knees and a spoon in his hand, eating a mouthful, and then watching the children; but all the while his mind was on the house with seven red windows.

When they had finished their supper, Mrs Cable undressed and washed the children; and Richard took them one after the other on his knee and combed their hair and kissed their cherry lips, and made them all kneel together round him and fold their hands and close their eyes and say 'Our Father.' But his heart was not with them when they prayed; it was sealed. When they had finished 'Amen,' he carried each in his arms, clinging to his neck, and put them one by one to bed. Little Bessie would not go to sleep that night unless he sat by her and let her hold his hand. He submitted, and watched the closing eyes of the child.

When all the seven were breathing softly in sleep, Cable mended some shoes and knitted some stockings, and carpentered at a broken stool. Then he went up to his bedroom. The moon was shining through the window. He opened it, and leaning on the sill, looked out. The moon floated like a silver bowl on the indigo-blue heaven-sea. Here was the very bowl in which St Kerian had rowed to the earthly Paradise; there, dusky, in it was discernible the form of the rowing saint. Below, lay the village, bathed in pearly light. The granite church tower with its pinnacles turned outwards, glittered against the bank of black yews between it and the parsonage. The only other light was that from the forge, red, palpitating. Why was the smith working so late? Ah! he could earn money, a good deal of money,

by hammering and turning his iron after usual hours, but much was not to be got out of breaking stones for the road.

Richard Cable wiped the perspiration from his brow. A great struggle was going on in his breast. There was money, abundance of money to be had for the asking, money that, he was told, was now lying idle and accumulating. Should he put out his hand and accept some of it? He would not be obliged to communicate with Josephine, only with the Hanford lawyer. What was before him if he remained at St Kerian? Only privations and cares, the parting with his children. His soul was full of sores; and this day a rough hand had brushed over the quivering nerves, and brought the sweat of agony to his brow, and the tears of humiliation over his cheeks. But for all that, he could not resolve to touch the money offered him. It would be a condoning of the wrongs offered by Gabriel Gotham to his mother, and of those offered him by Josephine.

'It must be somehow, but not that way,' he said. 'I will have the house, like Hanford Hall, of my own building, with the seven red windows, as in my dream. I will think of nothing now but how I may come at it.'

#### CHAPTER XLII.—A GOLDEN PLUM.

Nothing is more simple. Fortune sits on a cloud and lets down golden plums suspended by a hair into this nether world of ours. Those of us who are wide awake and on the lookout for plums, the moment we see the golden drop descend, dash past our neighbours, kick their shins to make them step aside, tread them down if they obstruct our course, jostle them apart; and before they have pulled their hands out of their pockets and rubbed their eyes or their bruised shins, and have asked all round, Where is the plum? we have it in our mouths, have sucked it, and spit the stone out at their feet.

No sooner is one golden plum snatched and carried off, than Fortune, with a good-humoured smile, attaches another to her thread, and lets it down through the clear air into our midst. What a busy, swarming world ours is, and all the millions that run about are looking for the plums in the wrong places! It is said that the safest place in a thunderstorm is the spot where lightning has already fallen, because it is ten thousand chances to one against the electric bolt descending in the same place again. With Fortune's plums we may be sure that the unlikeliest corner in which to come across one is that where a plum has already been let down. No man when he fishes whips the stream precisely where he whipped last. But this is what few consider. The moment one of us has caught and bolted a plum, there is a rush to the spot, and even a scramble for the stone we have thrown away—and see! all the while behind the backs of the scramblers a golden fruit is dangling, and Fortune shakes her sides with laughter to observe the swarm tossing and heading at the sucked stone, whilst a single knowing one quietly comes up and takes her newly offered plum. The eyes of all the rest are turned in the opposite direction till the opportunity is lost.

In this chapter I am going to relate how

Richard Cable caught sight of and got hold of one of Fortune's golden plums; not, indeed, a very large one, but one large enough to satisfy his requirements. It came about in the simplest way, and it came about also in the way least expected.

'Hullooh!'

Whilst Cable was breaking stones on the roadside, Jacob Corye stood before him. He had not seen the host of the *Maggie* since he had left his roof, nearly a year ago. Since his departure, Richard had occasionally spoken to his mother about Corye, and had told her that the sufferings he had undergone from the weariful talk of the landlord had almost equalled those he endured from his injured thigh. Now that he heard the saw-like voice of Jacob, he looked up and answered ungraciously. He was ill-pleased to renew acquaintance with the man, and be subjected again to his tedious prosing about the rearing and raising and fattening of young stock. Yet that moment was a critical one; on it hung Richard's fortune. Jacob himself had caught a glimpse of the golden plum, and with rare generosity, or rather, with by no means singular stupidity, was about to put it into Richard Cable's mouth, and Richard was like a child offered a rare fruit, that bites cautiously, and turns the piece about in the mouth, considering its flavour, and then, at once, having satisfied itself that the quality is excellent, takes the plum at a gulp.

'Hullooh!' said Jacob Corye, standing before Richard, with his hands in his pockets and his legs wide apart, with a pipe in his mouth, and speaking with difficulty and indistinctly because of the pipe, which he was too lazy to remove. 'How be you a-getting on in the world, eh? I needn't ask that, cap'n, when I seez you come down to stone-knacking for a living.'

'If you see that, why do you ask?' inquired Cable irritably.

Jacob continued, imperturbably: 'I reckon you're a bit disappointed with your house. The garden ain't much for the raising and fattening of seven little maids.'

Richard did not answer. He frowned and continued hammering.

'I reckon you're pretty well on wi' the stone-breaking,' said Corye. 'What'll you be on to next?'

'Whatever turns up,' replied Cable curtly.

'That's just it,' the host of the *Maggie* said; 'and I've come here to look you up and make you an offer. I've been a-troubling and a-worriting my head ever since I came to think at all, about the rearing and the raising of young stock, and how to get rid of the regraders' profits. I don't mean to get rid of 'em either; I mean to get the profits for myself and do without the regraders. Well, cap'n, I've figured it out on a bit o' paper. I couldn't get my ideas into order no other way. Do'y look here. There's manganese in St Kerian, ain't there?'

'Yes,' answered Cable. 'You can see that for yourself.'

'So I have. I seez the washing-floors, and the water running red as riddam [ferruginous water] away from them. There be three or four washing-floors, ain't there?'

'Yes. You can count them if you are curious; I am not.'

'Oh, I've nothing to do wi' manganese,' continued Jacob, 'more than this—that my meaning is, just as the manganese has to be washed in this tank, and then in thicky [that one], and every time it is washed you get rid of the rummage and get more o' the metal, so is it with ideas. I've got an idea or two in my head, and I've been a-stirring and a-scouring of it over and over for years; but I can't get rid of the rummage; there must be another floor on which to give it a second wash before we get at the pure metal. So my meaning is, I want you to take into consideration what I've a-said about the raising and rearing and fattening of young stock, and give it a second wash in your brain; and then, I reckon, something'll come of it. It be them blessed regraders as has to be got rid of—washed out of the cattle, so to speak.'

'Go on,' said Richard. He knew his man—that there would be no getting rid of him till he had talked himself out.

'Doy' look here,' continued Jacob, leisurely taking one hand out of his pocket, tapping the ashes from his pipe, replacing his pipe between his lips, in the corner of his mouth, and then his hand in his pocket. 'When one of the quarriers or masons goes on to the tors after granite, it ain't every piece as will serve his purpose. He may spend a day over what seems a fitty [fitting] piece; and then may discover, when he's half cut it, that it's beddy [liable to split], or so full of horseteeth [spar] that he can make nothing out of it, and all his labour is thrown away. Now, I want you to lay hold of my idea, and turn it out with a crowbar from where it lies in the bog—that is, my head—and split it up and see whether it is beddy or horsetoothy, or whether there's good stuff in it for use. I can't do it myself; I've not had the education. I can show you a score of ideas bogged in my brains; but I can't tell you whether they're workable and shapeable. Now, I ax you to do that; and I'll send you a kilderkin of *Maggie* ale for your trouble, if you can find what is useable in my ideas; and, for a beginning, the rearing and the raising and the fattening of young cattle.'

'I should have supposed that was the only idea in the bog you call your intellect.'

'There, you're wrong,' said Corye, by no means affronted. 'It is the most re-markable and conspicuous idea, that's all. My mind is like Carnvean Moor. If you go over it, you see the Long Man, a great old ancient stone about twenty feet high, standing upright, that they tell was an idol in the times of the Romans. When you go over the moor, you can see naught but the Long Man; but do' suppose there be no more granite there than thicky great stone? If it were took away, you'd find scores on scores of pieces lying about, more than half covered wi' peat and furze and heather.'

'Go on, then, with your Long Man.'

'I'm a-going along as quick as I can; but I can't go faster.'

Jacob smoked leisurely for some minutes, contemplating Cable, who worked on without regarding him.

'It's all very well saying Go on, when one has an idea, but it ain't possible. If I hadn't an idea, I could gallop. It is just the same with

the miller's donkey; when the boys get a sack of flour over the donkey's back, the donkey goes at a walk and cautiously. What do' mean by hollering "Go on!" to him then? He can't gallop his donkey, because of the sack of flour across it. So is it with me. I must go along quietly and cautiously, at a footpace, because I've got this idea over the back of my intellect; if there were none there, I'd go on at a gallop.'

'Then go on at your own pace,' said Cable, 'and don't zigzag.'

Richard sat breaking the stones and listening at first inattentively to the prosing of the host of the *Maggie*; but little by little his interest was aroused, and when it was, then he forgot his work. The breaking of the stones became less vigorous, till at last Richard sat looking dreamily before him with the haft of the hammer in his hands and the head resting on a stone. He no more raised the hammer over the stones that day, but hobbled home in a brown-study. The thoughts of Jacob Corye, when washed on the floor of his brain, proved to be sterling metal; or, to take another of the landlord's similes, the Long Man of his boggy mind when chipped by Cable's tool proved to be sound stone.

I need not give my readers the turbid talk of Jacob for them to wash, but will let them have the scheme of the innkeeper after it had been sifted and arranged by Cable.

St Kerian lies eleven miles from Launceston, which is its nearest town. Thither the farmers have to drive their bullocks and sheep for sale. It is even worse for those near the coast; they have to send them some fifteen or twenty miles. At Launceston market the cattle are sold to jobbers, who drive them along the great high-road called Old Street—ancient, no doubt, in Roman times—to Exeter, a distance of thirty-eight or forty miles, where they are resold to dealers from Somersetshire, Gloucestershire, and even Berkshire. Of late years the South-Western line has run to Plymouth by Exeter and Okehampton, so that cattle have been trucked at Lydford, Bristow, or Okehampton. Quite recently, in 1886, the South-Western has carried a line into Launceston; but at the time of which I write, the line had not come nearer than Exeter, thirty-eight miles from Launceston, and fifty from St Kerian, and some sixty from the coast.

Now, Jacob Corye had picked up scraps of information from the coastguard, some of whom came from Gloucestershire and Somersetshire. From them he learned that the farming done there was dairy-farming. Butter and cheese were made and sold at Bath, Bristol, and in London. The land was good, the pastures rich; no stock was raised there—it did not pay to raise stock, or it did not pay so well as dairy-farming. Along the north coast of Cornwall the land was poor, and exposed to the western sea-gales. Only in the bottoms of the valleys was good pasture and rich alluvial soil. There was a great deal of white clay about, lying in bars from east to west on the hillsides, sometimes filling the valley bottoms; and where that was, nothing would grow but scant grass and rushes, and sheep put on it were certain to rot. This land did well enough for young stock, and was worth from five to ten shillings an acre; but it was fit for nothing else. Corye considered that when the farmers sold their cattle

at Launceston, the jobbers who drove them to Okehampton or to Exeter and resold them, made a tidy profit; so did the dealers who bought them at Okehampton or Exeter and trucked them on into Somerset, or Gloucester, or Berks. There were at least two profits made out of the bullocks and heifers before they reached their ultimate destination.

Then, again, the dairy-farmers, after their cows had calved, wanted to get rid of the calves; it did not pay them to rear them on their dairy-land. On the other hand, the North Cornish farmers could not get calves enough to rear on their poor land. When it came to fattening the young stock, they could not do it; they had not good pasturage for that; therefore, they were forced to sell, and sell cheap. In precisely the same manner, the farmers in the dairy counties sold their calves cheap. The bullocks they did not want at all, and the heifers they wanted after they were grown into cows, but not before. So sometimes calves from Somerset travelled down into Cornwall, and travelled back again, after a lapse of a couple of years, into Somerset; and as they went down, they passed through two or three dealers' hands, leaving coin in their several palms; and as they went up, they passed through the same hands, and again left coin in their several palms.

Now Corye saw this confusedly. He had tried his utmost to clear the matter by using a stump of a pencil and a bit of paper, but had only succeeded in further bewildering himself. Cable saw his way at once. There flashed on his eyes the gold of the plum, and he put out his hand for it. He did not take long to consider. He at once offered Corye to drive his stock to Exeter, to truck them there, and go up country with them, and dispose of them in Somersetshire or Gloucestershire. By this means he would save the profits of at least two intermediaries. He proposed that one of these profits should go to Corye, the other to himself. Jacob Corye was to provide him with a cob on which to ride, and was to advance him a small sum sufficient for the maintenance of his children during his absence. Whatever Corye advanced to him, he was to deduct from Cable's share of the profits on his return. The scheme was so simple and practicable that the host of the *Maggie* closed with the offer at once. It was a relief to him to find that his ideas were being put into practical shape. This pleased him more than the prospect of making money.

'You see,' said he, shaking hands again and again with Cable, 'I've ideas, but they're bogged.'

'Do more,' said Richard, 'than send your own stock; buy of your neighbours, that I may have a large drove. The larger the drove, so long as it is manageable, the more the money that will come in.'

'Doy' look here,' said Jacob. 'I'm a liberal man w<sup>i</sup> them as deals liberal w<sup>i</sup> me. I'll keep all your little maids on *Maggie* ale as long as you're away, and no charge. I said a kilderkin, I say two.'

'Thank you,' answered Richard. 'The little girls drink only water and milk.'

Cable finished the work he had to do for the waywardens on the road; he said nothing to any one in St Kerian except his mother about his

projected journey; but he went over to the *Maggie* once, before starting, to concert plans, and see a coastguardman who came out of Somersetshire, and who, Corye thought, might be of use to him. The man was anxious to send a message home, and with the message some Cornish crystals set in bog-oak as a brooch for his sister, who kept an inn near Bath; also some specimens of peacock copper, and spar with tin ore in it, and mundic. These samples of the riches of Cornwall would interest the Somersetshire folk of his native village of Bewdley. Cable took the names of some of the farmers about the place, and promised to lodge at the inn and give the specimens and the brooch.

'My sister,' said the coastguardman, 'has a lot o' little childer; but I haven't seen none but the eldest, whom she calls Mary.'

'Her eldest—Mary!' exclaimed Richard. 'I'm certain to put up with her. What is her inn?'

'The Otterbourne Arms. It belongs to an old lady who is Squires of the place, called Otterbourne.'

Richard received his instructions from Jacob; they were confused and unintelligible. He almost offended him and brought the agreement to a condition of rupture by declining *Maggie* beer.

'I've a notion of taking the pledge,' he said.

'More's the reason you should take a drop now, afore you does,' argued Corye.

The night before his departure, Richard Cable could not sleep. He saw that the golden plum was let down within his reach, and he had his hand on it. There remained to him only to bite into the rich fruit. But in this case, as in all other in this world, every good thing brings with it something bad—there is no gain without loss. If he were about to rise from want to plenty, he must consent to be much parted from his children. What this meant to him, few can understand. We all have our interests, our friends, our studies, and although we love our children, they do not engross our whole thoughts, occupy our hearts to the exclusion of everything else. With Richard Cable it was otherwise. He had no friends, no acquaintances, no pursuits, no interests apart from his children. He lived for nothing else, he thought of nothing else. He worked for nothing else; he loved nothing else, except only his mother. The wrench to him was almost unendurable. He had given up the thought of going to sea after his accident, because he could not bear to be parted from them; and now he only left them because he had resolved to make his dream come true, and in no other way that he could see was that dream to be realised.

Richard kept a little lamp alight all night before he left home, because he left his bed every hour to look at one after another of the seven little sleeping heads, and to wonder which he could best spare, should it please that Providence, which so ill-used him, to take one away whilst he was absent. He found that he could not part with dearest Mary, so thoughtful and forbearing with others, so full of love and kindness to the youngest ones—so like a little mother to them, though she was only fourteen years old; nor with Effie, so sprightly, with her twinkling eyes, and that dimple in her ever

laughing cheek ; nor with Jane, who clung to Effie, being her twin-sister, and who must go if Effie went ; nor with Martha, who had such endearing, coaxing ways ; nor with Lettice, with a voice like a lark, so shrill, yet withal so clear and sweet ; nor with Susie the pickle, who already knew her letters, and could say BA—Ba, and one and two makes three ; no—she said BA spells sheep, and one and two makes four ; no, not with Bessie the baby, Bessie, whom, after all, it would be best that God should take.—No, no, no—ten thousand times, no !

#### A TRIP TO BRITTANY.

ONE breezy afternoon in the month of August we glide into the harbour at Honfleur. As we have an hour or more to spare before the train leaves for Lisieux, we send our luggage on by omnibus to the station and saunter after it on foot, lingering on the drawbridge to look at the fishing-smacks and other craft lying alongside the quay. The journey by rail to Lisieux is through wooded valleys, brightened by a curving trout-stream ; and we only lose sight of this glittering rivulet when, on nearing our destination, we plunge into a long tunnel under the hills. It is growing dusk when we reach Lisieux, so we postpone our visit to the old streets, and still older cathedral, until the morrow. There is something peculiarly attractive about many of the houses with their irregular gables and overhanging upper floors ; but here and there, especially in La Rue aux Fèves, the quaint carvings on doors, windows, and walls are half hidden by the articles displayed for sale. From an artistic knocker are suspended several pairs of boots ; and against the carved window-frames or oaken panels hangs a gay assortment of Breton costumes. In a corner of La Place Thiers is the cathedral ; it is wedged in between a monastery and a row of modern houses. The exterior, with its two irregular towers, over a superbly arched doorway, carries upon its weather-beaten front some signs of revolution ; the steps are worn with the tread of pious feet ; but the gargoyles under the roof are sadly defaced by the missiles flung by impious hands at their stony features.

By railroad to Caen ; the country is flat pasture-land, relieved in the background by wooded hills. In every direction one sees some solitary poplar of imposing size and beauty, but often detracting from the charm of the distant undulating landscape. The town of Caen possesses a lion's share of architectural fame. Standing on a commanding height to the north-east of the town—where William the Conqueror built a castle during the middle of the eleventh century—many a handsome church tower or steeple rises above the roofs of the houses of this historic city. The castle has long ago disappeared ; but the small chapel of St George and a Norman hall still remain as notable landmarks of the Conqueror's time. The old ramparts have been repaired, and a comparatively modern structure, reached by crossing a drawbridge, now forms a barrack there. In front of this drawbridge, guarding these memorable precincts, a sentry paces up and down. It is at Caen that the Conqueror's bones have found a resting-place in the Abbaye aux Hommes. This church was erected by William ; it is one of the

finest Romanesque buildings in France. The two western towers are models of Gothic architecture. The interior of the church is characteristic of the early Norman period ; on each side of the aisle one looks down an avenue of Gothic arches with a framework of Roman arches to enhance the effect. In the centre of the chancel is a gray stone slab, marking the spot where the Conqueror's bones repose. It is not many miles from Caen to Falaise, the place of his birth. Here we spend a whole day.

The castle of Falaise is an ideal stronghold, the appropriate home of so great a conqueror. It is reached by passing through the principal street of the old town of Falaise and then mounting a hill to the right, where there is a handsome equestrian statue of William surrounded by his six Dukes of Normandy. Passing over a bridge, one finds one's-self at once on the ancient ramparts—the ramparts built before the Conqueror was born. A mere ruin of the old castle is standing ; but the room, or, more strictly speaking, the bare walls of the room in which William first saw the dawn, is shown by the custodian with a well-feigned credulity in historical events. He is an antique man, with a long white beard, who taps the walls and mutters 'Old, old !' in a pathetic voice while leading the way to Talbot's Tower, a tower built on one side of the castle in the fifteenth century. By mounting this tower, a fine view is gained of the ramparts and of the surrounding scenery. A small stream flows through the valley immediately below, watering, as it has done for centuries past, the deep moat around the castle. Glancing at our custodian as we descend the winding steps, we wonder, as he tells us that he is a native of Falaise, whether any of the Conqueror's blood flows in his veins. But he soon diverts our attention from himself by stepping into a recess on the staircase and pointing out a well, into which he drops a stone, in order to sound, for our edification, its extraordinary depth ; and then he speaks in a confidential tone of a subterranean passage from the castle into the town of Falaise, and carries us back into a period of chivalry and romance.

Nor do we fail, while making Caen our headquarters, to pay a visit to Bayeux. A walk from the station of half a mile, through a winding avenue of lime-trees, with green meadows on each side, brings us to the town. There is no need to ask our way to the cathedral, for, rising high above the houses, we descry its three lofty towers, the finest being the one over the western entrance with pointed and round arches, alternating in the different stories. This Roman-Gothic structure dates from the twelfth century. The interior is of great architectural beauty. The clerestory is exceptionally high, and through its rows of Gothic windows there descends into the nave a flood of glorious sunlight. Walking under the Norman arches in the side-aisles—arches surmounted by a trefoiled arcade—one gains an inspiring glimpse of the chancel beyond in a subdued light that enters slantingly through the lancet windows. Here and there about the town of Bayeux we come upon antique houses, landmarks of historic mysteries that no chronicler has ever clearly solved. In the Rue St Martin, at the corner of the street leading from the cathedral, one of these old houses especially attracts

our attention. As it is an inn—spoken of as the manor-house at Bayeux in the fifteenth century—we enter *sans cérémonie* and order *déjeuner*. The room into which we are shown, with its heavy beams overhead and its irregular walls, interests us deeply; so we ask the landlord, after ‘regulating’ our bill, to show us over the old mansion. With an expression of mystery overspreading his Norman features, he invites us to step up-stairs. We follow him up a winding stone staircase, worn by five centuries of footsteps. He points out the fine carvings on the oak panellings of the doors and walls and *cheminées* of the rooms through which we pass; and the look of mystery, always increasing, culminates when he lights a lantern, in his own room and in broad daylight, and indicates a certain cupboard door. This cupboard upon being opened reveals no mystery: it is an empty cupboard—the depth of a thick wall. The mystery lies beyond. Stepping before us, the landlord gives the panelling at the back of the cupboard a strong push, and it moves inward on rusty hinges, discovering a dark passage with a flight of stone steps winding downwards into a dungeon as deep and ill-ventilated as a well. Over this weird retreat the landlord holds his lantern and whispers: ‘*Les oubliettes!*’

Returning through the town, decked with flags and banners—for it is a fête-day at Bayeux—we look in at the famous library—famous as containing a remarkable page out of English history, rather than on account of its antique volumes. The Bayeux tapestry—quaintly illustrating the Norman Conquest—records the spirit of enthusiasm which existed in the hearts of Queen Matilda and the ladies of her court when they undertook the execution of this work.

It is evening—the evening after our visit to Bayeux—and we are seated beside the driver of a crowded *diligence*. We arrive at the summit of a steep hill—a magnificent plateau, upon which is situated the town of Avranches. There are miles of wooded valleys on all sides. Towards the west, between a silvan landscape and the sea, we observe a wide expanse of briny sand, through which a river flows and brilliantly reflects some lingering rays of sunset. Beyond, between the sunset and these sands, which the tide has left high and dry, is Mont St Michel. This conic rock, with an old fishing-town at its base, with monastery church and castle above, rises out of the Atlantic. The road from Avranches to Mont St Michel makes a gradual descent towards the sea. Along a broad causeway, with a desert of sand on both sides, we arrive at the outer walls of the fortress. The entrance into the town is gained by passing through three gateways; the third still retains its portcullis, but the arms overhead—doubtless the arms of the monastery—are almost effaced. The town consists of one short and narrow street, with irregular and picturesque old houses on each side. Then commence the six hundred steps. We stop to take breath half-way, at the arched gateway leading to the monastery, with its magnificent Salle des Chevaliers below the cloisters, and its singular crypt, literally paved with the dust of dead monks. The ascent from this point to the terrace is by broad stone stairs between antique walls of granite, with many a Roman archway overhead. We reach the terrace and look out

upon the wide area of sand, for it is still low tide. But the sea comes quickly in over this flat surface; and not two hours elapse, after the first indication of the recurrent tide, before the waves are leaping noisily against the rock, and every sign of sand has disappeared.

So full of romantic interest is every nook and corner of Mont St Michel, from the rocky beach at its base to the ramparts above, that it is with strong reluctance we leave for St Malo *en route* for Dinan. The morning is cool and cloudy when we steam out of the harbour at St Malo and steer cautiously round the rocks with which this coast simply bristles. Among these rocks—upon which one sometimes observes a ruined fort, that time and tide have compelled to capitulate unconditionally—the tall lighthouse is most conspicuous, seemingly indicating the danger to navigators even in broad daylight. The numerous sailing-boats, gliding in and out behind the rocks, fill the bay with all the animation of a gala-day. This scene is suddenly blotted out when we enter the Rance, that beautiful little river which flows on its tortuous way from Dinan. It is like a miniature Rhine, with wooded and rock-bound hills on both sides. The old town of Dinan, which we reach in less than two hours, is on a slope overlooking the valley. Strolling through the shady boulevards on the heights, which represent the line of ancient fortifications, the scene below is bathed in sunshine, for the lowering clouds which covered the sky at daybreak have disappeared. Later in the day we walk to the village of Lehon, about a mile from the town, ensconced in a wooded dell. From the ruins of the ancient castle, which we reach by climbing a steep hill, we cast our eyes over the hamlet upon an extensive woodland scene. On the other side of Dinan there is a grand old ruin of the Chateau de la Guaraye. We drive to this romantic spot through an avenue of young oaks. Alighting at a little wooden gate, which a rustic holds expectantly open, we presently find ourselves in an overgrown fruit-garden of large dimensions. In this garden stand the mouldering walls of the chateau, the weird abode of bats and phantoms. The architectural beauty of these ruins is but faintly expressed, for here the ivy climbs in such profusion that the delicately carved stonework that ornaments the windows and doorways is almost hidden from view.

On our way to Quimper, *via* Brest, we break our journey at St Brieuc. The market-place is swarming with Breton *paysannes* in their spotless white caps of all shapes and sizes. We edge our way through this busy crowd towards the cathedral, where the patron saint and founder was buried; but so many centuries have passed since St Brieuc died, that even the pilgrims have at last ceased to visit his tomb. The town is some fourteen hundred years old, for it dates from somewhere in the fifth century. We were not surprised to come across several antique houses with quaintly carved wooden heads upon the outer walls. A diminutive lantern above a doorway—a lantern that looked old enough to have lit up the saintly face of Brieuc himself as he went by—excited our curiosity as we passed through the Rue St Jacques. Although deeply impressed with the old physiognomy of St Brieuc and its industrious people, we lose no time in travelling on to Quimper, for it is

here we have resolved to establish our headquarters for a week or more, and project excursions to various points of interest along the coast.

To the fishing village of Douarnenez and its sheltered bay we journey first. Here the peasants, even more busy than at St Brieuc, were clattering through the stony streets in their wooden shoes, as we strolled down to the sandy beach beyond the town. It is a sultry, cloudless afternoon. Crossing the bay in a little ferry-boat, with the boatman's boy in the stern 'screwing' madly at an oar, we land in the 'crystal isle,' as it is called. Wandering through a shady avenue that leads towards the lighthouse, we search a sequestered spot, on the outer shore of the island, for an invigorating swim. We find the very place under the low cliff, and plunge into the cool, transparent waters, where the waves are gently breaking against the rocks out in the 'open,' and creating frothy patches in the blue expanse of sea.

On the morrow, at an early hour, we start on our way to the Pointe du Raz. From Audierna, which we reach by *courrier*, the country is flat, though the monotony is broken by an occasional glimpse of the sea. But we would have journeyed through a desert without complaining, for the fine sight which we now gain of the famous Pointe, the wildest promontory on the coast of France. The weather here, as our weather-beaten guide informs us, is nearly always boisterous. It is, by good luck, fairly calm to-day, so we clamber over the rocks and look down with a certain sense of awe into the Trou du Diable. The tide is coming in over the huge boulders and descending into this great gap with a sound like the firing of cannon. There is something about this scene that almost awakens a feeling of terror, even by daylight, when only a light wind is blowing. Who, then, could adequately describe this picture of ruin and riot upon a night of tempest and shipwreck? The guide calls our attention, sailor-like, to the black hulk of a large vessel, which, wedged in tightly between the rocks, was lost in the last *grande tempête*! Le Moine—a rock strangely resembling a gigantic monk lying on his back with the cowl drawn over his face—is only one among the many odd fancies which the scene awakens. The Caves d'enfer are close alongside, in the Baie des Trépassés; and this stony friar seems to be floating that way with the incoming tides.

Quartered next at Vannes, a town of mediæval streets, into which one enters by picturesque old gateways, we explore places of historic interest in the immediate neighbourhood, not omitting to make a pilgrimage to the ruined abbey of St Gildas, along the peninsula of Rhuys, nor to climb the famous Celtic mount, La Butte de Tumiac. But no pilgrimage can surpass the one to Carnac, where the country is thickly strewn with druidical ruins. We sail among the islands, in the archipelago of Morbihan, to Carnac, and from there we drive to Auray. At Rumesto, about half a mile along the road, we stop at a small flight of steps by the wayside, and crossing a field, come upon a massive stone, supported by other large stones standing upright. Is this dolmen a ruined sepulchre raised to the

'memory' of prehistoric man? Upon this road, in an opposite field, there are other dolmens closely resembling this one, with hieroglyphics upon the stones—writings which no antiquary has yet satisfactorily deciphered. At Ménéac, hard by, the large heath, with the gorse in full bloom, is thickly covered with 'menhirs.' They look like huge, dilapidated tombstones. The appearance of this great heath suggests a ruined cemetery. Passing by Kermario, where there are dolmens resembling those at Stonehenge, we wander down to the sandy beach near Carnac, and bathe in the Baie de Quiberon. After *déjeuner* at an old inn, we climb to the top of Mont St Michel, a celebrated tumulus. Looking down from this, the only elevated spot in the district, we see some landmark of the Druids on every side. Returning to Vannes that afternoon through the archipelago, the waters reflect a deep blue from the summer sky; and as we glide along in our steam-launch, we often pass some ideal fishing-town, its tranquil bay dotted with many a white sail; and on an eminence beyond, some Roman tower or Gothic steeple stands out in relief, with thickly wooded hills rising up behind. Reluctantly we leave Vannes, staying but a few hours at Nantes, for a visit to St Nazaire, before taking train for Paris.

#### WYTHRED'S WHARF: A THAMES-SIDE TALE.

##### CONCLUSION.—WITH THE TIDE.

AFTER lighting Mr Lintock's lamp, Duckett had descended to the basement, on a level with the wharf. It was a huge storeroom; its area represented the dimensions of the entire warehouse; and although there were piles of merchandise heaped up on all sides of the iron pillars which supported the floor above, its great size was still apparent, for there were avenues in every direction between these goodly piles wide enough for the trucks to run to and fro. Near the river entrance to this storeroom stood a wooden shed; it had a door facing the main avenue, and a small window on each side. On the door was written, 'Superintendent's Office.' Duckett raised the latch and stepped in. There was a desk under one of the windows, and under the other stood a stove with a funnel disappearing through a hole in the woodwork. The foreman drew up a chair in front of this stove, and having taken a look at the fire and fed it with charcoal, he began to appease his appetite out of a basin and a blackened tin can with a cork in it which stood on the hob. He ate his supper with apparent relish; but the mixture in the can did not seem to his taste; he rejected it with a grimace after the first draught. 'I'd rather drink a pint of senna,' declared Duckett, driving the cork home emphatically with the palm of his hand, 'than another drop of such stuff.' He lit his pipe with an air of resignation, leaned back in his chair, and stared perplexedly at the tin can. Had any one, he wondered, been playing him a trick? He was beginning to get sleepy—so sleepy, that when he looked round him at the walls of the shed, they appeared to expand and his head to grow proportionately larger. It was a maddening sensation. By an effort he

roused himself, stood upright, and tried his utmost to throw off this drowsiness. He was conscious of his responsible position; he was the sole watchman in the warehouse. If any catastrophe were to occur, no matter how it was brought about, he felt that the blame would fall upon his shoulders.

Ducket knocked the ashes out of his pipe, took up his lantern, and went outside the shed. He began to pace resolutely up and down the centre avenue between pyramids of sacks and bales. It was a painful struggle; but it lasted only a short time. No matter which way the foreman turned, whether to the right or to the left, he was always becoming more and more impressed with the fact that uncertainty lay beyond. This soon ended by the lantern dropping from Ducket's hand and going out; and then he sank upon the ground with his head resting upon a hard bale.

Was he dreaming? It seemed to Ducket, as in a dream, that some one glided past him like a ghost and that a light was flashed before his eyes; and then a long interval of darkness and confused fancies followed, until he gradually awoke—awoke with a start—strongly convinced that he had been roused by the clang of the warehouse bell. Could it be Mr Overbeck at the gate already? It was surely not yet ten o'clock! The foreman scrambled to his feet, and groped along the dark avenue of goods towards the superintendent's office; for he could find his way about the warehouse without a gleam of light. As he went along with outstretched hands he experienced a dull singing in the ears. Was it the gate-bell still vibrating in his bewildered brain?

Ducket found the stove-fire still burning, though low. He took down a lantern from the wall, and lighting it, glanced anxiously at the clock. 'Half-past ten,' exclaimed the foreman; 'why—'

It was the warehouse bell. It was no dream now; it sounded like an alarm, it was so incessant. Still half-dazed with the oppressing effect of his unnatural sleep, Ducket hurried across the yard, and unlocking the side-door leading into Thames Street, found himself face to face with Percy Overbeck.

'Why are you so dilatory,' said Overbeck, with an air of suppressed impatience, 'in answering the bell?'

'I only heard it, sir, a minute ago.'

'How's that? I have been ringing at short intervals for nearly half an hour. Is anything wrong?'

Ducket, looking puzzled at Overbeck's excited face, answered: 'I very much suspect that'—

'What?'

'That I've been drugged. That's why I couldn't come. I fell asleep; the noise of the bell awoke me.'

The excited expression in Overbeck's face increased. 'Are you here alone?'

'I'm the only one on duty; but I'm not alone in the warehouse,' said the foreman; 'Mr Lintock is here.'

Overbeck hurriedly demanded: 'Where?'

'In his office up-stairs. I left him there busy writing at his desk.'

'When?'

'Some hours ago—before I became drowsy.'

'Hours ago?—Show the way as quick as you can to Mr Lintock's room.'

Ducket, still more perplexed at Overbeck's manner, hastened up-stairs without a word. He was seized with a dreadful sense of apprehension; and on opening Mr Lintock's door, he uttered a suppressed cry. The wharf-owner's room was empty; but the lamp upon his desk was burning, and the light thrown upon his papers showed them in disorder. An inkstand had been upset upon the table, and the ink was trickling down into a pool upon the floor.

Overbeck, stepping forward, took a quick glance round him. Then he looked keenly at Ducket. 'Clogstoun has been here. He and Mr Lintock have met.'

The foreman's face expressed a look of horror.

'Now, Ducket,' said Percy Overbeck, placing his hand upon the foreman's shoulder, 'nerve yourself. Let us search the warehouse.'

The warehouse was explored from roof to basement. The foreman, who had known every turning among the dark lanes of merchandise since boyhood, took the lead, flashing his lantern into every nook and corner. On each floor they called on Mr Lintock loudly by name; but only an echo of their voices reached them. They stood once more within the wharf-owner's room.

'Ducket,' said Overbeck, 'cast your eyes carefully round. Is anything missing?'

The light from the foreman's lantern moved over the floor and then slowly round the walls. Suddenly it stopped behind Mr Lintock's chair.

'Do you see that peg, sir?'

'Yes.'

'The key should be there. It's gone.'

'What key?'

'The key, sir, to that private door; and Ducket pointed to a door opposite the window.'

'But,' said Overbeck, 'that leads out upon the wharf. And,' he added, turning the handle, 'it's locked. What can it mean?'

'It means,' said the foreman with sudden inspiration, 'that, dead or alive, master has gone out by that door.'

Without loss of time, by means of the superintendent's key, they made their way out upon the landing-stage. They looked eagerly across the dark river. The tide was lapping monotonously against the sides of the wharf; chains were rattling, boats and barges moored alongside creaked and strained at their ropes. Presently Ducket, who went flashing about with his indispensable lantern, cried out: 'There's a boat gone!'

'Ah!—Is the tide ebbing?'

'Ay, sir, ebbing fast.'

Overbeck reflected a moment; then he said: 'Give me the lantern.' Ducket obeyed. 'Now,' added Overbeck, 'unfasten a boat, and let us row down stream. We are on the track, I hope, at last.'

The foreman quickly set to work. There was a boat suited to their purpose lying outside a barge; it was soon loosened and ready for them to start.

'I'll take the sculls,' said Overbeck as he stepped into his place. 'You shall steer. You know this part of the river better than I do.—Are you ready?'

'Right! With the tide, Mr Overbeck?'

'Yes, by all means ; with the tide.'

And so, with Ducket grasping the rudder and Overbeck the sculls, the boat moved out into mid-stream. On they went with the ebbing tide under the black shadows of huge ships and towering warehouses until Ducket's lantern was a mere speck of gliding light in the darkness.

Bertha Lintock, although made aware in a message from her father that he should not return until late, began to grow anxious towards midnight. She paced up and down her room, and constantly listened for the sound of wheels in the carriage-drive ; the unpleasant affair, of which Percy Overbeck had spoken to her reassuringly, recurred to her mind. Though trusting in Percy, she could not conquer her strong presentiment of danger ; for, when a child, strangely enough, Wythred's wharf had made a deep impression upon Bertha. While walking at her father's side through the great sombre storerooms, they had reached some passage—walled with bales of merchandise—so dark and narrow that she had shrunk back with sudden fright, and would go no farther. That was her first visit, and she had never entered the warehouse since. Presently, Bertha heard a hurried step outside the house. She ran to the window and threw it open. Overbeck stood below. 'Percy!—has anything happened?' she asked. 'Where is father?'

'He is here, Bertha—at the gate. You have no need to be alarmed.'

Bertha hastened into the hall.

Percy Overbeck met her at the door, and they went into the dining-room together. 'Your father has been again seized with that odd fancy,' Percy hastened to tell her. 'He believes that while seated in his office this evening, Clogstoun threatened him. Panic-stricken, he escaped from this phantom, or reality, down his private staircase leading to the wharf. Here, groping his way to the barges, he dropped into a boat, and setting it adrift, went out with the tide. Ducket and I—to cut a long story short—overtook the boat, and'—

At this moment Mr Lintock slowly entered the room, leaning on Ducket's arm. His clothes were wet and bespattered with mud. Seeing his daughter, he stepped towards her, but losing strength, sank into a chair.

Bertha ran to his side and bent over him. 'Are you hurt, father?'

'No, my dear, only exhausted. Percy and our old friend Ducket,' said he, looking up gratefully into their faces, 'have saved my life.'

The wharf-owner's nerves were badly shaken. But a few days' rest, under his daughter's thoughtful supervision, restored him to health.

Clogstoun's face never haunted Mr Lintock again ; for on the day after this occurrence, the man was found at the warehouse among some bags of sea-damaged hemp-seed, breathing his last ; and as a small phial was discovered at his side containing traces of a narcotic, it was conjectured that he had poured a portion of this drug into Ducket's tin can, and had himself swallowed the rest with a strong resolve to bring his wretched existence to an end.

For some time Mr Lintock avoided the subject of his flight from the office and from the face.

It appeared, however, that at the moment when Clogstoun forced his way into the room, the wharf-owner retreated through the private door. This door he locked behind him, in order to cut off pursuit ; and thus separated from the Thames Street exit by Clogstoun's presence, Mr Lintock had made his escape by water.

In after-days, when Bertha had become Overbeck's wife, they often dwelt on that midnight affair at Wythred's wharf ; and it transpired how Percy, frequently on the watch for Clogstoun, having learnt something of his haunts and habits, had reason to suppose that he had found a means of getting into the warehouse. For this reason, he had appointed that meeting with Ducket, though scarcely imagining that events would take such a strange turn as they had done.

## RUNNING A TRAIN.

BY A RAILWAY SERVANT.

AMONG the thousands who travel by rail, there are probably very few who are cognisant of the precautions taken to prevent accidents ; nor are the majority of railway travellers aware that under the present system of 'running a train,' it is almost impossible for a collision to occur except through the negligence of some of the Company's servants. In an interesting article on Signalmen lately published in a contemporary, the writer explained how the signals were worked ; but he gives one a very inadequate idea of the care exercised by Railway Companies to prevent accidents and loss of life to travellers. For instance, we will take an ordinary train at its start in the morning. In the first place, at the commencement of the journey, the engine-driver and the fireman belonging to the train, after having 'signed on duty'—that is, signed the train-book in the shed-foreman's office—and being passed by the foreman as fit for work, are required to be with the engine about an hour before the time of starting the train, in order that the driver may satisfy himself that the engine is in proper working order. His first care is to see that the engine has been thoroughly cleaned, that all working-parts are free from grit ; and that his previous night's statement as regards repairs, &c. to the engine, has been acted upon ; and gets coal and water. He then oils all working-parts himself, and proceeds to the station to 'pick up' the carriages forming the train. Each carriage has been overhauled by the carriage-examiner, whose duty it is to see that the train is all right and fit to proceed on the journey ; and where any defect is noticed, the carriage is taken off and sent to the 'shops' to be repaired.

The train is now within the jurisdiction of the station-master, who, having previously seen that the signals and signalmen in his district are in proper condition, at once proceeds to satisfy himself that the carriage-examiner has done his duty properly, and notices that the carriages are properly 'coupled.' It will be at once easily understood that to prevent oscillation and to secure

the easy and smooth running of the train, it is necessary that all the vehicles composing the train should be so tightly coupled as to insure the buffers being brought so firmly together as not to be separated by any change of gradient or by the starting of the train. It is the station-master's duty to observe the state of all couplings—including continuous brake couplings and cord communications—and cause any that require it to be adjusted. These couplings are also examined by the guard, who while in the station is under the orders of the station-master. After the guard has seen that the doors of the carriages are properly closed, the train is ready to start. The signal to the engine-driver to proceed must be given by the guard upon receiving intimation from the station-master that all is right. When there are two or more guards with a train, the signal to the driver must only be given by the guard nearest the engine, and then not until he has exchanged signals with the guard or guards in the rear.

On the guard rests the chief responsibility for the safe running of the train. How onerous are his duties may be seen from the following. In the first place, he must regulate the working of the train in accordance with the time-tables of the line over which he has to run. He must also see that the train does not travel on the line after sunset or in foggy weather without a red tail-lamp and two side-lamps, which he must keep properly burning throughout the journey. Every guard when travelling must keep a good look-out, and should he apprehend danger, he must at once attract the attention of the engine-driver. This he does by using the 'communication,' and also by applying his hand-brake, if he has one, sharply and releasing it suddenly. This operation—from the check it occasions—if repeated several times, is almost certain to attract the notice of the driver, to whom the necessary caution or danger-signal must be exhibited; and should the train be fitted with a continuous brake with which the guard has a connection, he must apply it until he is certain the driver is alive to the danger. Should danger be first apprehended by the driver, he immediately gives three or more short sharp whistles, which is a signal for the guard to apply the brake.

If, from any cause, it is found that the train cannot proceed at a greater speed than four miles an hour, the guard must immediately go back one thousand yards, or to the nearest signal-box, if there be one within that distance; in which case the signalman must be advised of the circumstance. Otherwise, the guard who goes back must follow the train at that distance and use the proper danger-signals, so as to stop any following train until assistance arrives or the obstruction is removed. When the train is stopped by accident or from any other cause, the guard must go back as before mentioned, and place detonators on the rails at fixed distances, and must not return to the train until recalled by the engine-driver sounding the whistle.

Should the absence of a signal at a place where a signal is ordinarily shown, or a signal imperfectly lighted, be noticed by the guard, he must treat it as a danger-signal, and report the circumstance to the next signalman or station-master.

These rules properly carried out, and signal-

men and others doing their duty, it will be plainly evident that, although accidents will sometimes occur, the Railway Companies do their best to secure the safe working of the line.

## A ROGUES' PICTURE-GALLERY.

### IN TWO PARTS.—PART I.

In times long since past, it was customary to brand a criminal before he was released from durance vile. A mark was set upon him, so that, like his prototype, all men might know him. The custom was eventually relinquished, possibly on the ground that it savoured too much of the torture-chamber, albeit the pain inflicted could have been little in comparison with that suffered in the extraction of a tooth, a form of torture to which even the most innocent among us are occasionally subjected. But the system, cruel or not, died out, and now the clumsy searing-iron has given place to the photographic camera. The man's flesh is no longer impressed with the red-hot iron; but he impresses his image, all unwillingly, upon the sensitive chemical film; and from the negative so produced, his likeness can be printed and sown broadcast over the land, if necessary, at a few hours' notice. One notorious criminal was in recent years identified, and hunted down by means of the rough outline of his features which appeared in a daily newspaper.

In these days, a photographic album is to be found in every household, and it contains pictures of those whom we love and respect. But the album which is owned by the police authorities is of a very different kind. Loved ones are conspicuous by their absence, for the portraits are of those who are known as the dangerous classes. Fear could not more effectually cast out love than it does in the case of these evil-doers. As the commercial man keeps his note-book for purposes of reference, so do the police keep this album for the identification of those who, having sinned once, may possibly continue in evil courses. This album is not open to public inspection, except under certain circumstances, but is kept for the private use of the police authorities. A similar collection of portraits is now made in every civilised country, and occasionally the interchange of some of these pictures is found to be very serviceable to the honest members of the community.

In the United States, this system has been more completely carried out, perhaps, than in any other country; for there it is not uncommon to arrest a suspected man, take his portrait, and if nothing is proved against him, let him go again. But, contrary to the custom prevailing elsewhere, the American collection of celebrities, or rather notoriety, has been to a certain extent made public property; that is to say, the section of it which has reference to crimes against property has recently been published.

This unique book now lies before us, and we venture to say that it forms one of the most curiously interesting, but at the same time sad compilations which it was ever our lot to peruse.

It is a handsome quarto volume of more than four hundred pages, and is of abnormal thickness; for, in addition to the letterpress, there are contained between its covers more than two hundred photographs. The title of the book is as follows: '*Professional Criminals of America*, by Thomas Byrnes, Inspector of Police and Chief of Detectives New York City—*pro bono publico*.' It is published under the authority of the Board of Police, and its introduction and preface give a general account of the scope and purpose of the work. We continually have evidence that the old adage, 'Truth is stranger than fiction,' represents a patent fact. In the introduction of the volume under review, it is found necessary to point out that it is not a work of fiction, but is an absolutely true history of the criminal classes. For nearly a quarter of a century has its compiler served in the police department of the city of New York, during which time he has made official acquaintance with rascaldom in all its varied branches. His experiences, as well as his opportunities for tracing the histories of those delinquents with whom his occupation has brought him into contact, have given him material, which he has worked up with great ability in the book before us.

But, it may be asked, what is the purpose of such a book? Is it to pander to the morbid desire felt by many to peruse the details of crime? This is by no means the case. Its publication is a protective measure. Crimes against property are of such frequent occurrence, and new methods of carrying them out are being so constantly elaborated, that it is thought if a full and particular account of the manner in which criminals go about their nefarious schemes be exposed, likely victims will be upon their guard. Inspector Byrnes tells us that experience has shown him such an exposure is really necessary. During his three-and-twenty-years' connection with the police department, he has found that bankers, brokers, commercial men, and those most liable to the attentions of thieves, were strangely ignorant concerning the many and ingenious methods resorted to by rogues in quest of plunder. In this book, therefore, those methods are fully detailed, and mysterious thefts are explained. The doings of some of the most notorious robbers are set forth, and the account in each case is accompanied by a portrait of the hero of the story. These portraits, like the rest of the book, are admirably done. They are no mere woodcuts taken from photographs, but are the photographs themselves reproduced by what is known as the Collotype process. That they were obtained unwillingly is obvious, for a photograph, although a silent witness, may be a 'speaking likeness.' This unwillingness to be photographed is illustrated in the frontispiece of Inspector Byrnes' book, where a criminal is being held still by four men while his image is being secured. Modern discovery enables photographs to be taken in so rapid a manner and under such secret circumstances that now it is quite possible to get a man's portrait without his permission or even knowledge. Police authorities will no doubt avail themselves in the future of a means which is calculated to give a far better likeness than a portrait can afford which is taken under compulsion. A few of the sitters have obviously distorted their faces, but most of them

have made up their minds to the inevitable, and have sat quiet. Some even have brushed themselves up, and have been photographed with a smile on their faces; and the inspector tells us that many show a weakness to appear to advantage; and that he has seen women especially whose vanity became evident directly the camera lens was turned upon them. Each portrait in the book bears a number, which corresponds with one placed against the account which is appended of the criminal's career; his name and the alias which he has adopted are also placed beneath the picture. The various branches of the 'profession' which are represented by these portraits comprise bank burglars, bank-sneak thieves (a sneak in this sense is one who is a loafer, and watches his opportunity to 'sneak' into the place for the purpose of stealing anything from an umbrella to a bag of gold), forgers, hotel and boarding-house thieves, sneak and house thieves, shoplifters and pickpockets, 'confidence-men,' receivers of stolen goods, tricks of 'sawdust-men,' and frauds in horse-sales. A brief account of the various methods pursued by these industrious but dishonest workers will be of some interest in showing how far the American criminal differs in his operations from his European confrère.

A first-class bank burglar stands as much at the head of his 'profession' as does a successful Queen's Counsel overtop his brother-lawyers. He must be possessed of several high qualities, among which may be reckoned courage, determination, fertility of resource, and mechanical skill. Some of these men have such an intimate knowledge of the mechanism of locks and safes, that no strong-box or vault can be regarded as 'burglar proof' whilst they remain at large. Their implements are sometimes made by themselves, but more frequently by a mechanic so far in league with them that he will ask no troublesome questions so long as he is well paid for the tools he makes. These tools are simple, but strong, and include steel wedges, a spirit-lamp and blowpipe which will soften and destroy the temper of metal-plates, a diamond-pointed drill which will pierce the hardest steel, and sometimes dynamite. The last-named has frequently been used to blow open a refractory safe, while, to cover the noise of the explosion, an accomplice has driven past the scene of action with a rumbling cart full of clanging milkcans. But sometimes the work is done in a far less violent manner, and preparations for the assault of the bank decided upon are conducted carefully for months before the actual event takes place.

A very general method is to hire some house which adjoins the bank premises, and to carry on there a legitimate trade for some time, so that the occupants may earn the character of harmless and desirable neighbours. In some cases, rooms above or cellars below the bank premises have been rented with this view, the landlord often being the head of the corporation which is ultimately to be robbed. The leader of the gang employs his time in making the acquaintance of the bank clerks, perhaps finding among them a black-sheep who may become his ally. The walls, floor, or roof of the vault is eventually broken through, and the gang of robbers disappears, laden with treasure. In other cases, the cashier who holds

the keys of the bank has been traced to his home and to his bedroom. Impressions of the keys are then made in wax, or, should the sleeping cashier be aroused, he is secured by some of the gang until the rest have time to effect the robbery. It is a curious but true circumstance that many of these bank burglars are model husbands and fathers. They will educate their children at the best schools and lead a most exemplary home-life. They evidently look upon their calling as a legitimate profession, and drop all thought of it, as other business men will do, when they reach the door of their own household.

The bank-sneak thieves occupy a lower grade in the profession of knavery. They are men of pleasing address, good education, and adopt that best of all disguises, a faultless attire. While the burglar works at night, the bank sneak conducts his operations in the full light of day, and must therefore be possessed of great presence of mind. The length to which one of these worthies will go in order to attain his ends is well illustrated by the following anecdote. The hero of the story was a bank sneak, who one morning entered the building which he had determined to rob, went behind the counter, hung up his coat, and donning another, coolly installed himself as a clerk at one of the desks. He was requested by one of the real clerks to leave the place, but impudently told his interrogator to mind his own business, and threatened to report him as soon as the manager or president arrived at the bank. But eventually he was made, under protest, to vacate the seat. Full of virtuous indignation, he walked with dignity out of the building; and it was not until some time afterwards that the clerk whose position he had usurped discovered that the cash was fifteen thousand dollars short. This type of robbery, thanks to increased vigilance on the part of the police, has almost ceased to exist.

With regard to forgers, we learn that their number, compared with other classes of criminals, is small, only about two dozen men being recognised as applying their talents as penmen and engravers to the fabrication of spurious documents. Photography is largely employed by them; and, by the irony of fate, the same art is now used for their identification. Their methods do not differ from those which have been detailed so often in our own courts of justice, so that we need not dwell upon them. We may, however, refer to the clever manner in which one gang of forgers made the English criminal investigation department play into their hands. This gang had prepared an elaborate scheme for defrauding the English banks by means of counterfeit circular notes. Shortly after they left New York by steamer *en route* for Britain, the scheme was discovered, and the English police were furnished by Atlantic cable with all its details. The forgers were of course ignorant of this. Their audacious leader, upon arriving in London, thought that it would be as well to make himself acquainted with the faces of the chief detectives, and in the character of an American tourist he paid them a visit. They were so taken off their guard by the pleasant manner of their visitor, that one of the officers not only told him of the impending fraud, but actually showed him the New York telegram, which happened to be lying on a desk. It need hardly be said that the forger thus warned did

not tarry long in the metropolis: he and his gang left London that night.

Hotels and fashionable boarding-houses form the happy hunting-ground of another numerous class of swindlers. The first operation of one of these daring thieves is to scan the list of arrivals in the newspapers. He then hunts down his prey with a persistency which knows no rest. A gimlet to bore a hole in the bedroom door, a crooked wire to insert in that hole with which to pull back the bolt, and a pair of nippers to seize and turn the key left in the inside of the lock, are generally the sole tools which he requires, and such implements he can easily carry in his waistcoat pocket. As many as ten rooms have thus been entered and robbed in one hotel in a single night. Another method is to doctor the locks beforehand by unscrewing them, and after enlarging the screwholes, replace them in their former position. They give no evidence of having been tampered with, but after such treatment, a firm push on the door will easily cause it to fly open. In boarding-houses, the thief soon knows which of his fellow-guests owns the most jewelry, and he generally chooses dinner-time to remain upstairs and possess himself of it.

The American house-thief is a more vulgar kind of criminal, whose counterpart is probably found in every civilised country. He will coolly ransack a house while its occupants are away; otherwise, in the character of a pedlar, pianotuner, inspector of some kind, a book canvasser, or an insurance agent, he will gain access to the place, and will go away not empty-handed. One of these men will rejoice over the notice of a fashionable wedding, particularly if the wedding-presents are numerous. He then makes it his business to hunt down the happy pair, who are probably too much engrossed in themselves to worry much about their worldly belongings, and often manages to relieve them of their jewels and plate. These men usually work alone, but sometimes there may be two or three interested in the proceedings.

The shoplifters and pickpockets do not call for special remark; but those astute persons who are termed 'confidence-men' are worthy of more notice. The British form of 'confidence-trick' we have always regarded with hopeful feelings, for it proves most conclusively that the men who practise it are so utterly devoid of inventive talent that they cannot be very dangerous. They are content to run in the same groove in which others have moved, and a clumsy and wretchedly designed groove it is. The confidence-trick has so often been exposed in the newspapers, as well as in our pages, that it is familiar to most people. But, wonderful to relate, it constantly claims fresh victims; and we may be certain that a large majority of the cases which occur never come to public light. For poverty of design and utter absence of dramatic construction, this mode of swindling stands by itself. The *dramatis personae* are three in number, and consist of the victim, A, usually some honest farmer, who, by the cut of his clothes and by the way he stares about him in a large city, readily proclaims his rustic origin. Enter B, who casually drops into conversation with A, and presently suggests a friendly glass at the nearest public-house. Here the two are joined by C (an accomplice of B). C tells of a rich uncle

who has lately died and left him a fortune, which he hardly knows how to spend. Rolls of notes and packets of gold are displayed in proof of his assertion. He announces his resolve to give away a lump sum of money to any man in whom he can feel implicit confidence. There is no reason why A and B should not be the happy recipients of his generosity; but, as they are comparative strangers, he must first ascertain whether he can place implicit confidence in them, and whether that confidence is mutual. In order to assure them of his unsuspecting nature, he gives his purse to B, who goes out for a stroll. B returns in a short time, and C expresses his satisfaction with this noble proof of B's honesty. C next takes B's purse out of the house for a time, and duly returns it. A is next invited to hand his purse to B or C for a like test of his honesty. The receiver, say C, once more goes out for the regulation stroll. B soon finds an excuse to leave A for a few moments. A patiently awaits the return of his quondam friends, but alas for the credit of human nature, they never come back. In America, the confidence-trick assumes far more clever forms, and it is accomplished by men of polished address, who haunt some of the best hotels. One of these men, who recently died in an American prison, is said to have gained during his career more than one million dollars by operating upon the credulity of his fellows. In one case, he robbed a man of thirty thousand dollars. Meeting this man some years later, he declared his penitence, and promised restitution, and he actually obtained from his victim a further sum of three thousand dollars!

### OCCASIONAL NOTES.

#### WOLF-CHILDREN.

WITH reference to our recent article on the above subject (*Chambers's Journal*, June 25), a correspondent writes as follows: 'In connection with the stories of wolf-children, it may not be uninteresting to mention that while lately on a visit to Melbourne, the writer went with his wife and two little children (aged two and four) to see the Royal Park, where the wild animals are kept. There, among others, they came upon a cage with four large wolves, lying sleeping on the ground. They took no notice of the writer or his wife or the elder child; but the moment the younger toddled up, they sprang simultaneously to their feet and made for the corner of the cage nearest her. Not content with this, two of the largest stood on their hind-feet and pressed themselves flatly against the cage, pushing their great fore-paws through the bars towards the child, as though to get at her, and wagging their tails and barking frantically the whole time, their eyes riveted on her. As she walked away, they rushed across the cage to the other corner and repeated their antics. When the child uttered a word or two, it seemed to affect the wolves singularly, and they redoubled their efforts to get near her. The writer went again with the same party and infant, and with the same result.

'Now, the aspect of these wolves, in spite of their barking and excitement, was decidedly not ferocious, but more resembling a great collie

when at play; and the writer felt convinced no harm would have happened to the child had the wolves succeeded in getting to her. Possibly, in some wolves the maternal instinct may be very strong.'

#### STEEL TUBES FROM SOLID RODS.

A curious way of making steel tubes from solid rods was communicated by Dr Siemens to a recent meeting of the Akademie der Wissenschaft. A steel tube ten centimetres long (nearly four inches), with perfectly smooth external and internal surfaces, and extremely uniform bore, and whose walls are apparently of perfectly equal thickness at all points, was prepared in this manner: Two rollers, slightly conical in shape towards their lower ends, are made to rotate in the same direction near each other; a red-hot cylinder of steel is then brought between these cylinders, and is at once seized by the rotating cones, and is driven upwards. But the mass of steel does not emerge at the top as a solid, but in the form of the hollow steel tube which Dr Siemens laid before the meeting. This striking and singular result was explained by Professor Neesen, who was present. It appears that, owing to the properties of the glowing steel, the rotating rollers seize only upon the outer layer of the steel cylinder, and force this upward, while at the same time the central parts of the cylinder remain behind. The result is thus exactly the same as is observed in the process of making glass tubes out of glass rods.

#### SUNSET.

A BRIGHT, clear streak of sunset gold  
Tingeth each cloud,  
Though darkly they the sun enfold  
As with a shroud.

He is gone down to death a king;  
In state he lies;  
Royal the pall, his covering  
Of stormy skies.

From that low cloud it is they gleam  
Over the sky,  
The glory-shafts that, far flashed, beam  
Piercing on high.

So, Mortal, from the open grave  
Of dear Hope lost  
The rays surge up in golden wave  
O'er darkness tost.

Still thou thy heart! The hidden light  
But seeks the morn,  
Thy Hope fares on through veiling night  
To rise new-born.

## THE CLERK OF THE WEATHER.

'GIVE my compliments,' says Swift (1740), 'to the Clerk of the Weather, and tell him we are all shamefully in a puzzle as to what season it can be. Here we are in the month of May, and the cold like Nova Zembla,' &c. Who the Clerk of the Weather may be just at the present time, or whether the same official holds sway as in the days of the great Dean, it would be hard to tell; but of our perplexed and lamentable condition just now there can be no possible doubt.

I am living in a lonely hamlet, at the top of a steep hill some three leagues away from the quiet old city of Winchester. Round about us on all sides stretch miles and miles of green shady woodland, clothing the hillside, and sloping down into the valleys, away across the golden harvest-fields and plain between us and Winton, the shining roofs of which, on a clear day, can be dimly made out on the horizon. On a summer morning at six A.M. no fairer or more picturesque a stretch of country could be found in a long day's march. For beauty and variety of colour it could hardly be matched, even now, after this long and terrible drought. Of the drought, however, which is silently burning us all up—scarcely a drop of rain since the first week in June—we cannot complain. What everybody else has to endure, we must bear without growling, though every pond for miles round us is a cake of dry mud and every brook has perished. We have had blazing summers before 1887, and in spite of many prophets of evil, have come out of them little or none the worse for the scorching. But this present season, ever since March last, in these parts has been like no other known to the oldest inhabitant. The whole affair has been a puzzle and a mystery; full of contradictions, confusion, and mistakes. April showers came in March; the cuckoo got all wrong in his dates; May came in like a lion, and went out like a lamb; for nearly nine weeks after that we had east and north-east winds of Siberian ferocity.

If the glass went up almost until it could go no higher, rain was sure to follow. If it fell to 'Change' or 'Rain,' we got whole days of dry and fine weather. Again and again the sun came out without a cloud, and yet it was far colder than when the sky was dark with clouds.

Take one single day (July 20) as a sample of what Jupiter can do in the way of puzzling us poor Hampshire folk—a day of blazing heat; the sky like brass; the air stagnant; not a leaf on the tall silver birch or the quivering poplar stirs for a moment from its unbroken rest. Overhead, masses of cloud are rushing swiftly across the blue heaven, as if before a gale of wind. But, here below, not a breath ruffles the broad expanse of leafy woodland, look where you will, far and wide.

Yesterday, the exact converse amazed us. A furious wind went raging through the trees; clouds of white dust flew before the blast in every broad road or narrow lane; every garden flower-bed was powdered; the roses fell in clusters; the wheat-field bowed her head in despair. Overhead, the sky was full of clouds; but the sharpest pair of eyes that ever looked up would utterly fail to make out the slightest motion in any one of them; and yet, all the time they were moving, and in half an hour the face of heaven would be changed.

Last night, at eight P.M., after a cloudless day of unbroken sunshine, as the sun was going down, in less than ten minutes the whole expanse of western sky became suddenly crowded with broken, twisted masses of murky cloud; fantastic wreaths of smoky vapour, with spaces of sullen light between, pierced through and through with sharp arrows of purple and black. Slowly, by degrees, the arch of heaven grew darker and darker, until it seemed as if a hurricane of wind and rain was about to sweep down over the thirsty fields. Had Dr Cumming been present, we should have heard many things of Gog and Magog, the crack of doom, and the Battle of Armageddon. But nothing, absolutely nothing

came of it, after all. Water-butts, tubs, and tanks all opened their thirsty mouths; but not a drop fell!

This very evening, almost the same pageant again came to pass. After a long day of cloudless, scorching glare, with scarcely a breath of air aloft, at seven P.M. it began to blow suddenly from the north-west fiercer and fiercer to half a gale of wind. In a few minutes the sky was black as night with masses of heavy brown vapour, all looking as if crammed with rain. This lasted for three hours, when the moon rose in splendour, the stars came out in a cloudless sky, and there was a dead calm, as sultry and oppressive as ever.

This is a great butterfly country, and in the green woodland paths and fields round about us I have in a single season captured more than forty different species, from the Royal Emperor himself down to the tiny Harvest Blue; each and all appearing at their appointed time, within a few days of their known regular date. This year, the order of things has been upset. From the 26th of December 1886 to May 1887, we never fairly got rid of our snow. In March and April, no butterflies appeared. Rarely, now and then, an old battered specimen of the small Tortoiseshell turned up in some sheltered corner of a lane or woodland path; or, still more rarely, a Yellow Sulphur. Not a single specimen of the Meadow-brown (large or small) showed itself, though in ordinary seasons to be counted by hundreds in every hedgerow. Of the lovely White Admiral, which in July usually swarms on the blossom of the bramble, not one was to be seen. Of the Hairstreaks, which I have counted by the score in many a June morning ramble, not one opened its wings to the sun until August, and even then only in twos and threes. Of Red Admirals and Emperors there was, up to August 12, no sign.

Six weeks ago, in every hedgerow there were millions of plants of wood-strawberry and wild raspberry; every woodland path was white with snowy blossom. Not a berry has followed the blossom, not even in a large bed in the vicarage garden. All our bees perished of cold and bitter drought before April, and a strange wild swarm took possession of the desolate hive in July!

The intense heat—seventy degrees in the thickest shade out of doors—still prevails; but there are no wasps; though armies of blue-bottles invade sun and shade, outdoor and in. Moles, which ought to be quietly burrowing under the long grass, are found creeping mournfully among the geraniums, or dead by the dusty roadside. In every meadow, cornfield, and green woodland road there are now clouds of white butterflies that ought to have appeared in April.

The very birds seem demoralised. At the vicarage gate is a rustic pillar-post, which, as we have no post-office, serves for the whole neighbourhood, and is often crammed with letters and newspapers. The box itself is about a foot high, the internal area about a foot square, the aperture about five inches by one. What does a bewildered Tomtit do but persist in building her nest inside it! There she has built two nests—one apparently being found too fatally liable to an avalanche of letters—laid seven eggs, and having finally arranged her nursery, hatched, reared, and got out of the box the whole septet

of a brood safely into the open air through that one narrow opening; though she might, as any well-behaved Tit would, have chosen from a thousand little nooks of safety in the woodland shade, and there brought up her family in comfort.

But we are all fairly at sixes and sevens down here among the lonely woods, and we appeal to the Clerk of the Weather to set matters to rights with a week or two of quiet rain; otherwise, we shall all be utterly burned up, and incinerated both in mind and body; and autumn will come upon us with a whole army of demoralised squirrels, field-mice, grasshoppers, and distracted dragon-flies, all clamouring to know what season has befallen them!

B. G. JOHNS.

WOODMANCOTE, August 1887.

## RICHARD CABLE, THE LIGHTSHIPMAN.

### CHAPTER XLIII.—A LOW LOT.

WHEN the morning broke, Richard Cable did not dare to kiss the white brows or the rosy cheeks of his sleeping children; but he took little locks of their shining hair between his fingers and put his lips to them, and dropped over each alike a clear tear-drop, and then went away before the seven pairs of bright eyes opened, and the little voices began to chirp and laugh and chatter.

Richard Cable drove his herd of young cattle all the way from St Kerian to Exeter, some fifty miles. There he trucked them on the Bristol and Exeter line, and travelled with them into Somersetshire, where he disposed of them to such advantage that he was well content. But he would not return with only money in his pocket. He had a van constructed, very light, on four wheels, for his cob, and he bought as many calves, a week or ten days old, as he could convey in this van.

He made Bewdley his headquarters, and stayed at the *Otterbourne Arms*, where was the landlady, Mrs Stokes, the sister of the coastguardman at Pentargon. To her he remitted the spar, and the mundic, and the brooch of bog-oak with Cornish crystals in it. She was a tidy, red-cheeked woman, with many children. Among these was a Mary, the eldest, as Cable had been told there would be. He took great delight in talking to and playing with this little girl, and also in listening to the crowing and laughing, and occasional crying, of the rest of the family. They recalled to him sounds very familiar and very dear. He looked long and curiously at the little Stokes' children, and thought how vastly inferior to his own they were in every particular, in manners and in appearance. He did not allow the landlady to see that he drew comparisons between her children and his own—that he considered the blue of his Mary's eyes purer and deeper and truer in colour than that of the irises of her Mary—that there was richer gold and gold more abundant in the hair of his eldest daughter than crowned her first daughter. He had not the coarse pride which would suffer him to do this, and wound the good woman's vanity; but he thought it, nay, he knew it; he was as positive that all superiority in every way lay with his children and his Mary, as

that an English soldier could thrash a dozen Frenchmen.

Cable was a temperate man. He remembered that terrible night when he let little Bessie fall. He never got that experience out of his mind; consequently, he was on his guard against the temptations of a cattle-jobber's life—the sealing of every bargain with a drink. So he drank cold toast-and-water when he could, but he had taken no pledge. 'What's the good of a pledge to me?' he asked himself. 'I've only to think of Bessie's back, and if I had the best spirits in the world before me, I would not touch it.'

'Have you any relatives this way?' asked Mrs Stokes one Saturday evening. 'There's a young woman of your name at the Hall, a lady's-maid to Miss Otterbourne.'

'I have no relatives,' answered Richard, 'but the seven and my mother who are under my roof at St Kerian, in Cornwall.'

'Tis a curious and outlandish sort of a name too,' said Mrs Stokes. 'I mean, it ain't a name one expects to come across twice in a lifetime.'

Richard shrugged his shoulders.

'Here comes Mr Polkinghorn, the footman,' said the landlady. 'He does come here at times to see if there be any one to have a talk with. He can tell you all about your namesake.'

'I am not interested about her,' answered Richard. 'I have none that belong to me save the seven and my mother, and they—I know where they are, under my own roof.'

'Good-evening, Mr Polkinghorn; how do you find yourself?—And how is Miss Otterbourne?'

'We are both of us pretty well. She's been suffering a little from nettlerrash, that has made her fractious, and she has rung the bell outrageous; but she's better now, and I'm middling, thank you. Worried with her nettlerrash and the constant ringing of the bell caused by the irritation. First, it was the blinds were not drawn to her fancy; then it was she wanted a lump of coal with the wood in the grate; and then the Venetian blinds must come down, or be turned, or pulled up; and then the geranium or pelargonium on the table—I'm blessed, Mrs Stokes, if I know what is the difference between a geranium and a pelargonium—wanted water; or she desired another book from the library. It really is wonderful, Mrs Stokes—I'll have a glass of beer, thank you—how a little matter upsets a whole household. It comes of lobster mayonnaise or cucumber, one or t'other, which don't agree with the old woman. If she takes either of them, and she's roaring fond of them, she gets eruptions, generally nettlerrash; and when she's got eruptions, it disturbs us all, keeps the whole household capering: one has to go for the doctor, another has to get cooling fomentations, and her temper is that awful, it is a wonder we stand it. But we know her, and put it down to disorder of the system. We must bear and forbear; must we not, Mrs Stokes? so we pass over all the aggravations, as good Christians and philanthropists.'

'You've not been introduced,' said the hostess. 'You don't know this gentleman, Mr Cable of Cornwall.'

'Cornwall!' exclaimed the footman.—'You don't happen to have come across the manor and mansion of Polkinghorn anywhere thereabouts, do you? Our family come from the west of England,

and have a lordship called after us; but I don't exactly know where it is. Still, it's traditional in the family that there is one. We've come down in life; but so have many great folks; and, sir, what are our British aristocracy now?—mushrooms, sir, creatures of to-day. Bankers and brewers and civil engineers, who were not even known, who had not lifted their heads out of the dust, when the Polkinghorns were lords of manors and drove their coach-and-four.'

Mrs Stokes produced the ale.

'I'll take a mouthful of bread and cheese with it,' said the footman, who was not now in livery.—'So you, sir, are called Cable. We've a Cable among us.'

'Do you mean among the Polkinghorns?'

'Polkinghorns, sir!' said the footman, bridling up. 'I do not, sir, think such a name as Cable has found its way among us, into our tree, sir. I alluded to an inmate of the Hall, sir, a lady's-maid there, who is a Rope or a Cable, or something of that sort—possibly, as she is not stout, merely a Twine.' Then, as he finished his glass of ale: 'Excuse my freedom, sir; I am generally accustomed a wit. I once sent a trifle to *Punch*.'

'Was it inserted?'

'I sent it, sir; that suffices. I do not myself suppose that our Cable does belong to you. There is a lack of style—a want of finish—you understand me, which proclaims inferiority. Not bad-looking, either, is Miss Josephine.'

'What!' shouted Cable, springing to his feet and striking the table. 'What did you say?'

Mr Polkinghorn stared at him and backed his chair from the table. He did not like the expression on the stranger's face; he thought the man might be a lunatic; therefore, with great presence of mind, he drew the cheese-knife from his plate and secreted it in the pocket of his short coat.

'I asked you a question,' cried Richard. 'What did you say?'

'Merely, sir, merely that—that we have a lady's-maid attending on our old woman who is good-looking, but wanting in what I should consider—breeding. If she be a relative, I am sorry'—

'What is her name?'

'Josephine Cable.'

'How long has she been with you?'

'Since last September. She was well recommended; she brought excellent testimonials. Her character quite irreproachable—from some good friends of ours, the Sellwoods of Essex, a respectable family, unfortunate in having gone into the Church. I should have preferred the army for them.'

'Why is she?'—Cable stopped; he was trembling. He put his hand to the table to steady himself. 'I mean—who is she?'

'I do not know,' answered Mr Polkinghorn. 'She is uncommunicative; that is what I mean when I say she has not the breed of a lady. She ain't at her ease and familiar with us. She is reserved, as she might call it; awkward, as I should say. If we ask her questions, she don't answer. She's maybe frightened at finding herself in such high society; and I'm not surprised. I don't fancy she was in other than a third-class situation before—with some people in business or profession—not real aristocrats. That

does make a person feel out of her element when she rises to our walk of life. It is just the same as if you were to invite a common sailor to a dinner-party among millionaires and aristocrats—how would he feel? He'd look this way and that and be without power of speech. He wouldn't know where to put his feet and how to behave himself. It is much the same with Miss Cable. She's not been brought up to our line of life, and don't understand it, and is as miserable among us as a common sailor would be among gentlemen and ladies.'

'Did you say Miss Cable?'

'To be sure I did. I don't suppose she's a married woman. She wears no gold wedding ring.'

'And her Christian name is?'

'Josephine. But then we always call her Miss Cable, and our old woman calls her Cable.'

'She has never said a word to you of her family?'

'Not a word. Better not, I suspect. I don't fancy there's anything very high about it. Judging by her manners, I should say she was—excuse my saying it—a low lot.'

'Nor whence she comes?'

'Mum as a mummy—excuse the joke. I am said to be witty. Humour runs in the Polkinghorn blood.'

'Nor what brought her to take service?'

'Necessity—of course. No lady would so demean herself unless forced.—Will you take a glass of ale with me?'

'With pleasure,' answered Cable; 'and I'll ask you not to mention my name at your place—not to the young lady you speak of.'

'I understand,' said Mr Polkinghorn with a wink, and a tap of his nose with his finger. 'Poor relations are nuisances; they come a-sucking and a-sponging, and are a drag on a man who is making his way. No, sir, I'll not say a word.—May I ask if she is a relative?'

'I have not seen her. I cannot say.'

'Does the name Josephine run in the family, as John Thomas does in that of Polkinghorn?'

'We never had one baptised by that name.'

'I myself,' said the footman, 'intend to marry some day, so as to perpetuate John Thomas. I'm not sure that I may not take Miss Raffles. I won't deny that I had a tenderness towards the Cable at first; she is good-looking, has fine eyes, splendid hair; a brunette, you understand, with olive skin, and such a figure! But I could not stand the want of polish and ease which go with the true lady, and that she will never get among us.'

Richard left the room abruptly. He was greatly moved, partly with surprise at finding Josephine in such a position, partly with anger at the insolence of the footman.

This latter looked after him contemptuously. 'Well, Mrs Stokes,' he said, 'I've only come on two Cables in the course of my experience, and, dash me, if there be not a twist in them both.'

Richard went forth, and did not return to the inn till late. He walked by the river. He was disturbed in mind. Mr Sellwood had told him nothing of Josephine's plan of going into service; he had not felt himself authorised to do this; and at the time he saw Cable, he doubted whether

Josephine's resolution might not be overcome. All that Cable knew was that she had surrendered the estate and left the Hall. She was proud, and would have nothing to do with a property that came to her, as she concluded, unjustly; and he was proud, he would accept no property that was offered to him by her. But that she had been so reduced in circumstances by this voluntary surrender as to oblige her to earn her bread by menial work, seemed to him impossible. Her father was a man of some fortune. It was not possible that he would consent to her leaving him for such a purpose. Yet, how else could he account for Josephine's being at Bewdley Manor in the capacity represented? There was a mistake. This could not be Josephine. Some one else was in the house who had assumed her name. He could not be satisfied till he had seen her. But he would not allow himself to be seen by her. He hobbled along the river-path, leaning on his stick, racking his brain over the questions that arose, seeking solutions which always escaped him. To whom at Hanford could he apply for information concerning the affairs and movements of his wife? There was no one but Mr Sellwood, and to him he would not write. His brother-in-law Jonas Flinders was dead, and he shrank from corresponding on the subject with any of his old mates.

Then he suddenly burst into a bitter laugh. Was this his Josephine, this servant-girl, whom the vulgar flunky, and with him her fellow-servants, despised as not up to their level, wanting in style—a low lot? Josephine, who had scorned his lack of breeding, was herself looked down on by the ignoble tribe of pariahs on civilisation! It was a just judgment on her. How she must toss and writhe, what agonies of rage and humiliation she must endure in such association! 'A low lot!' shouted Cable, slashing at the bulrush-heads on the bank, and laughed savagely—'a low lot!' But then a gentler feeling came over him, a wave of his old kindness and pity, so long suppressed or beaten back. He saw his haughty, splendid, wilful Josephine surrounded by these common-minded, swaggering, vain, unintelligent, and debased creatures—alone, cold, stern, eating out her heart rather than show her disgust and shame. If it had been misery to him to be transferred to a condition of life above him to which he was unfitted, it must be misery to her to be flung down into a sphere to her infinitely distasteful and repellent. He was a man who could hold his own, or retire with dignity. She was a girl, helpless. His heart began to flutter, and he turned his steps into the path by a wicket gate. The evening was still, the sky clear. The great trees stood against the silver-gray sky as blots. The dew was falling heavily; the grass was charged with water. He might as well have been wading in a stream as walking through it. So heavily was the dew falling, that the leaves of the trees were laden with the moisture, and bowed under the weight, and dripped as with rain. The glow-worms shone in the damp banks and among the grass under the tree trunks. The stars were twinkling in the sky, looking golden in contrast with the bluish light of the glow-worms; an auroral haze hung over the set sun, fringed with a faint tinge of ruddy brown before it died into the deep gray blue of the night-sky.

He drew near to the house, and a watchdog in the back court began to bark. It had heard his steps on the gravel of the drive. Richard stepped off the carriage-way upon the turf and remained still. The dog, hearing no further noise, presently desisted from barking. Then Richard moved on through the grass till he came where he could see the front of Bewdley Manor-house. Three tall windows were lighted, one somewhat brilliantly, the next less so, the third least of all. It was clear that all three belonged to one room, perhaps a drawing-room, and that the lamp that illumined it was at one end. The window which was at the further end was half open, the blind was drawn up, and Richard could make out gilt frames to large pictures on a dark wall. He stood, looking at the three windows, wondering whether a shadow would pass, and by the shadow he could tell who it was that passed. Did he desire to see Josephine again? He shrank from so doing; but he was uneasy at the thought that she was in this great house, a servant, with fellows like Polkinghorn about her. As he stood thus, looking up, he heard the notes of a piano issue from the open window. The first chords that were struck made him start and a shiver pass through his limbs. Then he heard a clear voice, rich and sweet, sing:

O wie wogt es sich schön auf der Fluth,  
Wenn die müde Welle im Schlummer ruht.

It was the familiar song from *Oberon*. When Richard heard this, he put his hands to his ears to shut out the sound, and ran as hard as he could run with his faulty thigh along the road; and the dog heard his retreating steps and barked furiously. Cable heeded nothing, but ran on, with the sweat breaking out on his brow and dripping from his face, as it had dripped on that night when he ran to Brentwood Hall, and as now the dew was dripping from the leaves of the trees in the park. Only when he reached the river-bank outside the park gate, away from the sight of the house and the sound of the song, did he halt and strike his stick angrily, passionately, into the oozy soil, and cry out, half sobbingly, half savagely: 'A low lot! A low lot!'

(To be continued.)

## BOAT-ACCOMMODATION IN PASSENGER-SHIPS.

THE inadequacy of the boats and other life-saving appliances provided for the use of the passengers and crews of our sea-going passenger-ships was demonstrated very forcibly at the loss of the *Oregon*. Seafarers are well aware that this evil has been growing worse *pari passu* with the increasing dimensions of the ships themselves, consequent on the resistless torrent of emigration towards the land of the setting sun. The keenness of foreign competition, intensified by the system of subsidies, has, however, effectually barred the way to any alleviation. The six days' passage across the Atlantic in the *Umbria* is a pleasure-trip in one's own yacht, when we compare it with the fifteen days' discomfort so vividly depicted by Dickens. No expense is spared in providing all those articles which conduce to the safety or comfort of the travelling public so long as the ship remains intact. If,

however, it should be deemed necessary to quit the floating palace, it would be found that not more than one-third of the passengers could be accommodated in the frail boats! Hence we may paraphrase lines in the *Tempest*, and say, 'Here is everything advantageous to life save means to live when danger threatens.'

Many an officer of a steamship cleaving the dark-blue waters with her iron prow at the rate of eighteen or twenty knots an hour, has had every sense abnormally quickened as he paced the lonely bridge. Despite himself, his thoughts would revert to the awful responsibility resting upon him. Fourteen hundred passengers aroused from their warm berths at a moment's notice to face the bitter blast of a cyclonic storm, and the salt spray freezing almost ere it falls. The indescribable panic; the ugly rush for the boats; the refined women and hardy men cast headlong into the sea; the wild shrieks of the drowning, as they drift away into eternity; and the final plunge of the quivering fabric into the seething abyss, with nothing in sight save the blurred outlines of a gigantic iceberg with which it has collided—all form a ghastly panorama.

The *Oregon* had over six hundred passengers on board; but her boats were only capable of carrying one-half of that number. It was fortunate that she managed to keep afloat for eight hours after receiving her mortal injury, that the sea was comparatively smooth, and that a passing steamer remained alongside, to which all hands were transferred in batches. We doubt whether otherwise the Cunard Company would still be able to assert that they have never lost the life of a passenger during the forty years of their corporate existence. The loss of their crack-ship served the purpose of Sydney Smith's proverbial bishop; attention was drawn to the danger which menaced passengers at sea; and Mr Mundella appointed a Departmental Committee to inquire into the supply of boats, rafts, and life-saving apparatus in British merchant-ships. In the meantime, the awful loss of life resulting from the collision between the Australian clipper *Kapunda* and the barque *Ada Melmore* had accentuated the demand for an alteration in the rules which govern the employment of life-saving gear at sea. The deductions of the Committee are excellent so far as they go. Indisputable facts have been placed on record, but very little new light has been thrown on the question at issue. We are not authoritatively informed that it is possible to provide desirable appliances, auxiliary to the boats in the davits, which shall be sufficient, in conjunction with them, to take off all hands from a sinking ship. Neither are we made any wiser as to the relative efficiency of the various plans proposed to this effect, if we except a short reference to Roper's Raft and Berthon's Collapsible Boat, both of which inventions are before the public.

The logical outcome of the inquiry would appear to be that a ship should not be allowed to carry more souls than she has room for in her boats. One would naturally shrink from recommending such a drastic reform as this. The better-class British ships have to comply with far more stringent regulations than ships sailing from continental ports, and if, in some quixotic spirit, a law should be passed which limited unduly the

number of passengers, our argosies would either cease to run, or would be placed under the protection of some other less exacting flag. If it were possible to frame an international agreement, something might be accomplished in this direction; but there would be an inevitable rise in the cost of transit, followed by a sympathetic diminution in the number of emigrants, which might not be altogether advantageous.

The Merchant Shipping Acts of 1854 and 1856 specify the number of boats which must be carried. The scale is founded entirely on the net tonnage, or, in other words, on the actual space in a ship which is available for carrying cargo. When the Acts were drawn up, ships were smaller than now, and were principally wooden sailing packets. The net tonnage of a sailing-ship is a fair indication of her size; but the net tonnage of a steamer is no criterion in this respect. Some Atlantic liners have boat accommodation for only ten per cent. of the total number of people on board. The Cunard Company carry double the number of boats that the law requires of them; but even in their *Gallia*, one of the best provided ships afloat, the boats could not find room for more than fifty-six per cent. of the passengers and crew. Steamships making excursions, and short voyages to Ireland and the continent, provide boat-accommodation for about twelve per cent. of the total number of persons on board; but even this low figure is three per cent. more than the statutory obligation!

The Cunarders *Etruria* and *Umbria* have each a gross tonnage of seven thousand seven hundred tons, and a net tonnage of three thousand three hundred tons. The Anchor liner *City of Rome* has a gross tonnage of eight thousand one hundred tons, and a net tonnage of three thousand five hundred tons. The enormous difference between the gross and the net tonnage is due to the allowance made for the space occupied by the crew and the engines. This disparity led the proprietors of the Suez Canal to levy dues on the gross tonnage in every instance, which seems a just method, having regard to the end in view, inasmuch as the absolute size of the ship to be handled is certainly the most important factor in narrow waters.

There are, however, grave obstacles to the substitution of the gross for the net tonnage as the basis on which to construct a hard-and-fast boat scale. We should avoid Scylla only to be dazed in Charybdis. Such a rule if strictly interpreted might press unfairly upon large ships in which the carriage of passengers is purely a secondary consideration, as the boats carried by this class of ship under the present system would probably be more than enough to satisfy all requirements. Moreover, two ships, although equal in displacement, may be very unequal in their adaptation for carrying boats either on deck or in the davits. Any increase in the number of boats, unless accompanied by a corresponding increase in the ship's company of sailors competent to handle them, would be of no avail, but rather a delusion and a snare. It goes without saying that boats are useless unless there be able seamen and skilled officers enough to keep them from being swamped. This state of perfection is a long way off, for shipowners will tell you that,

owing to the depressed state of the shipping industry, it would be simply suicidal to incur any addition to the working expenses. The ships are much under-manned, or at least the complement is adjusted to such a nicety that the crews are insufficient to manœuvre the few boats carried at present. The Nemesis of competition sits close behind the managing director, and dogs the footsteps of the overlookers.

Seven boats is the maximum demanded by the Acts, no matter how big the ship may be, or how many souls may be on board of her. These boats must be manageable, or else they cannot be got into the water without great exertion. Steamships of over one thousand tons net must be fitted with two lifeboats; but as they may be of any make, we must not confound them with the boats built to the specifications of the Lifeboat Institution, which are too cumbersome for use in short-handed ships at sea. The boats must be in the davits, fully equipped with water and the necessary gear. Every boat ought to carry a coarse canvas bag and a can full of oil, so that, when a boat is lowered in a heavy sea, the bag may be filled with oil, and towed over that part of the boat which is exposed to the force of the sea. This simple method has, as we have over and over again assured our readers, been proved to be effectual in smoothing the tops of the angry breakers. The boats of cargo-vessels are of all sorts and conditions, and in a great number of sailing-ships it is impossible to launch a boat should a man fall overboard. It will be safer and more humane to keep the ship on her course if the weather is at all dirty, than to risk the lives of an undisciplined boat's crew. An experienced master in the *Earl of Jersey* lowered a boat to rescue an apprentice. Neither boat nor crew has since been heard of; and a bereaved army officer advertises a reward of a thousand pounds for news of his two heroic sons, whom he will never meet on this side of the grave. Some sailing-ships carry their boats stowed one within the other, the innermost being made a receptacle for all kinds of old lumber. It would take half an hour to clean out the rubbish, find the gear, and get tackles aloft for lifting the boat over the side.

Even in steamships where the boats are conveniently situated, the foremast hands are as unfamiliar with the art of rowing as a ploughboy. The best merchant seamen seldom set foot in a boat propelled by oars. On the other hand, it is quite a common experience for a life-buoy to be dropped unexpectedly from one of our troopships and a cry raised of 'Man overboard!' in order to test the rapidity with which this duty can be performed. The engines are stopped, the boat manned and lowered, the buoy picked up, the boat returned to the davits, and the ship full speed ahead again in the short interval of five minutes. It is not sufficient to station men to the boats after the manner of our merchant steamships. Practice must go hand in hand with theory, and the men should be taught to be thoroughly at home in the boats when cast off from the ship. Such practical training if made compulsory would involve detention in moderate weather; but if rigorously enforced, the smartest ships would still be to the front.

The Collapsible Boats built by the Berthon Boat

Company have the sanction of the Committee, and are excellent contrivances for use in ships where the limited deck-space does not allow of a sufficient number of the ordinary boats. The Berthon boats are made of canvas, made water-tight by painting with a specially prepared composition. The canvas is stretched tightly over a wooden framework both on the outside and on the inside. The whole boat folds up very compactly, somewhat after the manner of a globular Chinese lantern, with the oars and fittings stowed snugly inside, and a cover is placed over all. The cover being stripped off, the hooks of the davit tackles are fastened into two slings, which pass under the bow and stern of the boat respectively; and when a strain is brought to bear on the tackles, the boat opens out of its own weight. Thereupon, two men jump in, insert some cross pieces, which prevent her reclosing, and she is ready for her life-saving mission. Our troopships have carried Berthon's boats for some time, and they fulfil the expectation of their designer. The form has been handed down from antiquity, and the Irish coracle is a primitive example. Five collapsed Berthon boats occupy the space of one ordinary boat. Roper's Raft forms a bridge when not in use; and when necessary, it can be disconnected and rigged as a schooner. Rafts do not commend themselves except as a last refuge. The raft of the well-known *Medusa* will never be forgotten. An American raft made a successful passage from New York to this country in the year 1867 in forty-three days. One of the best boat-lowering apparatus we have seen is that of Captain E. J. Evans, of Shaw, Savill's line, which is simplicity itself.

The Committee hold very poor views with regard to the utility of any kind of boats, so that it behoves our shipbuilders to make every effort to insure that the compartments into which an iron ship is divided may be water-tight. The construction of the hull of a transatlantic steamship has reached a high degree of perfection; but it is a polite fiction to state that the partitions are sufficiently strong to withstand the pressure of the water pouring in through a chasm in her side. It is almost impossible to have water-tight compartments; and if the ship be struck at the edge of a transversal partition, we should have two compartments knocked into one, and the safety of the ship endangered. Naval architects are in favour of a longitudinal partition extending along the middle of the ship from stem to stern. This structural weakness is so familiar to captains, that the first care immediately after collision is to shore up the partition.

The officers of a passenger steamer belonging to the large Companies are the elite of the merchant service, holding testimonials of exceptional merit. Out of the six officers of a Peninsular and Oriental steamship, four were qualified to act as masters; and the second-officer had passed the extra-master's examination; but we are not told how many of them were competent to handle an open boat in a sea-way! The officers in the merchant service have one failing in common: they shave the outlying portions of the land dangerously close in all weathers, so that any exceptional surface-drift of the ocean may place the ship high and dry on some hidden reef. The public are in a great me-

sure to blame for this reprehensible custom; they will not brook delay, and a commander is apt to be moved by the *vox populi* which can reach the Board-room of his Company. For a similar reason, ships keep up a higher speed in foggy weather than is prudent. On the southern edge of the Bank of Newfoundland, where the fishermen lie at anchor, it is not uncommon for a dense fog to continue throughout a whole week; and frequently the Atlantic liners make a passage across without a sight of the sun to verify their positions. Vessels are forbidden by statute to proceed recklessly in foggy weather; but the passage has to be made within a given period, and the regulations are inoperative. Blasts of the steam-whistle are deceptive in a fog, as two successive blasts will appear to proceed from quite different distances, although the signalling ship has not changed her relative position. Two White Star liners going in opposite directions lately collided in a dense fog while going ahead full speed; and the captains were censured for not slowing down, as loss of life occurred. The court was in part composed of steamboat captains, and as the law on this point is universally ignored, a study of the logbooks of these commanders would probably perplex an outsider. Unfortunately, icebergs and fogs are generally met with in the same latitudes, thus rendering the navigation doubly perilous.

Apart from the eagerness to shorten the passage, as displayed in cutting off corners and racing through fog, we find that passenger steamships are generally placed in perilous positions by causes from without, over which they can have no control. A good lookout may distinguish an iceberg; but it is not an easy matter to keep clear of a derelict (abandoned) ship low down in the water. These partially submerged vessels constitute a formidable source of danger to the fast steamship. The American government issue monthly charts of the North Atlantic and distribute them to shipmasters. A glance at one before us shows a score of death-traps in the shape of derelict ships floating in a small portion of the ocean adjacent to New York!

Worse than derelicts are the ships of all nations which fail to keep their side-lights burning brightly from dusk to daylight. The custom holds in many, although the oil would cost only fourpence per night. This evasion of the law is of too grave a nature to be dealt with by the infliction of a small fine. The Board of Trade officer can compel the owners to place lamps on board a ship; but when the dock-gates close behind her, the lamps are carefully stowed away below. We have seen lamps trimmed with cocoanut oil, which became solid in the wintry weather of the Channel, and absolutely refused to burn. Hence, it is necessary to take into consideration not only the quantity but also the quality of the oil used on board ship. What is more conducive to the disturbance of the mental equilibrium of a harassed officer on the bridge than a flickering light suddenly displayed by some wretched ship which lay unperceived in the darkness of the night not many yards distant!

The risks run in the North Atlantic are greater than in any other ocean; but there has been a signal immunity from loss of life. If time were not an important element, the passenger-ships

would conform to the law in every particular. Even now, a great portion of the accidents may be traced to the undermanning and flagrant law-breaking in sailing-ships and small steamers.

'Famous for ships, famous for horses' is as true of Great Britain as of ancient Attica; but if we are to retain our foremost position and to make ocean-travelling safe, it will be necessary to pay attention to undermanned and ill-found ships, to rigidly enforce the law with respect to side-lights, and to train our officers and men in the manœuvring of boats.

## AN ANGLO-INDIAN MOTHER.

### AN INDIAN SKETCH.

To the dancing, flirting, pleasure-loving portion of the male sex, she will always be a disappointment. She will never have her card filled at least a week before the ball comes off, for the good reason that she never goes to balls. She will never stand in draughty verandas with what she calls a 'wrap' across her fair shoulders, and talk inane nothings to her partner, while far into the night the weary band plays galops and waltzes that grow more and more out of tune. She will never keep her husband waiting long weary hours while she ruins her health by turning day into night at the frequent dances she attends. No man will ever pay her compliments, though every one can see she is pretty enough to receive them. To ball-loving under-secretaries, unexceptionable aides-de-camp, spurred cavalry officers, and gallant antediluvians in the shape of well-nigh retired colonels, she will always prove a disappointment and an aggravation. A star shining on them at an unapproachable distance—a scent of mountain flowers that rests on them for a moment—an unattainable good that under no circumstances could ever have been theirs, because they are aware that she and her thoughts and simple aspirations are above and beyond them.

How often I have seen her going about with her big little family, surrounded by natives of different castes and kinds. She greets me with a pleasant smile on her fair face; she stops a moment, and seems to ask me just the right question and say just the right thing; and when, having said good-bye, I pause and look back on her and her train of children and followers, I hope, when I at last make up my mind to forsake my bachelorhood, I may be blessed enough to find such a wife as she. You know that neither you nor I, nor any other man, considers her husband at all worthy of her—that, from our point of view, could scarcely be; but he is a good fellow enough, and that is the best we in our generosity can say for him. She considers him a thousand times better than herself. She treats him as such a woman would treat the man she loves; though of course none of us men can understand for a single moment how she can love him.

She is an excellent housekeeper, not disdaining the lower portion of her woman's work. She

is generous and gentle with her servants, and her table is always good. But it is as a mother that she shines the most. Her children are like her, and she is like them. They obey her because they love her, and her reproof is a greater punishment to them than any blow would be. She has never left them to servants. They have lived their Indian lives with her as their companion, and boys and girls alike have got the impress of her true woman's mind. She has taught them their first lessons; and under her tuition they are in different and interesting stages of *Mavor's Spelling-book*, from 'Ba, Bi, Bo,' to words of alarming length and hopeless pronunciation.

In the family, she is perfectly happy. Talk of balls, big dinners, picnics, and luncheon-parties; she has other attractions, and she does not need these to help her to pass her life. Look at her now in her happy family circle; see the peaceful untroubled smile in her sweet eyes; and as you look, remember that she will never be so happy again. There is looming for her in the distance a time which comes sooner or later to every Anglo-Indian mother, and when it comes you will see some things in her face which are strangers to it now.

As the happy years pass, she grows more thoughtful. Now and then, a wistful expression comes into her eyes. If, unheeding, you talk of the future to her, you feel sorry you have done so the next moment, as she changes the subject suddenly and looks unlike herself. After a time, she will steal at odd moments into the children's room, and moving gently from bed to bed, will watch each sleeping face with a deep pain at her heart; while the black woman in attendance, whose child has died but yesterday, looks up with a cheerful smile and tells her 'all the babas are asleep.'

And so the very last month arrives. Grindlay & Co. have taken passages for a gentleman and lady, six children, and two native servants. The children are in raptures. They jump and clap their hands; they fling their old toys into the compound with contemptuous jeers at their battered ugliness, and ask her a hundred questions about the English toyshops, the mighty ship, the wonderful place where there are no black people, and where their innocent young minds imagine no one tells lies or steals, because they are English. She packs their small wardrobes into overland boxes; she wanders in and out through the old familiar rooms, and out into the compound, where she has often seen the children play, and where, if she return ever so often to the same house, she will never see them play again. She lets her precious tears fall on the head of their small rough pony, when she gives him a carrot for the last time; and on that of an old brown and white pariah dog they have loved and cherished.

The children have very different thoughts from these. Twenty years hence they mean to come back to this very house—they tell her; and she is to have all their old pets and servants ready to receive them! She listens to these plans, which may never be realised; she looks into their small earnest faces with wistful eyes, and turns away.

We in the station see her go with a decided

feeling of regret; we feel, when she and her babies have left, a certain good will have passed away with them. We are of the earth; she will one day be of heaven, we believe. It has been pleasant to watch her life and see the simple faith that guided it. Doubtless, to know her has made us all at times feel a longing for something better. Her world is not the tinsel one of gaiety and pleasure; the light that illumines the stages on which she acts out her life comes, we feel, direct from heaven; while ours is but the garish glow of the footlights. Pure, good, and beautiful, she passes away from us; and probably not one of us may ever look on her gentle face again. Still, we cannot forget her, though she passes from our little world into another; the impress of her purity and sweetness will long remain upon our memories' page.

And so she goes. Her home is broken up; her family and she will soon be parted; that is the one appalling thought that is with her—the last at night, the first in the morning. Her children will grow up away from her, and in time they will forget her. Other hands will lead their faltering footsteps; other voices will cheer or chide them. She, their mother (after two rather sad years, in which the shadow of her parting hangs on her like a funeral pall), goes back to India. Having said good-bye to them at night, she cannot brave the morrow; but stealing once more to the side of each sleeping child, gazes with an awful broken-hearted sorrow on the well-loved faces, and breathes a helpless prayer for her deserted little ones, and tears herself away. To-morrow, when they wake, she will smile on them no more.

'Not, no more; oh! do not say no more,' I hear some Anglo-Indian mother like herself exclaim. 'Some day, let her come back, and be united to her children once again. Let her forget the lost years in their young lives when she is only a far-off dream to them; when friends in England are all in all to their baby souls; and "mamma" in India is a mythical somebody the young ones have quite forgotten, and the elder remember now but dimly. When she prays her simple prayers, she knows that "He is faithful that promised," and thinks and believes that they will meet again; and so, as she passes once more across the moonlit sea back to her foreign home, hugging the fond hope of a future meeting to her gentle breast, let us say, as the ship grows a dim speck on the horizon, "Amen! and God bless her."'

#### WHY IS SUGAR SO LOW IN PRICE?

THE question which heads this paper seems a very simple one, yet the answer to it is difficult, and involves many remote considerations, as well as some immediate contingencies that are not pleasant to contemplate. In order that the reader may understand these, it is necessary that he should be put in possession of a few main facts in the history of the sugar-trade. These facts might be looked at in the light of economic laws; but no acquaintance with the dismal science is requisite to enable any one to take in the present position of affairs. As the matter is one of great importance, from a social as much as from an economic point of view, its

consideration should prove both interesting and instructive.

At various times, sugar has been extracted from different substances, chief among these being the sugar-cane, grown in Demerara, British Guiana, Java, and the West India islands. Cane-sugar is made in this way. Shortly before the canes begin to flower, they are cut down; and the saccharine matter being squeezed out, is sent to London, Bristol, Greenock, and other places, to be refined. This process consists mainly in removing impurities by filtering and boiling; after which the fluid is crystallised in different sizes for the market. Cane-sugar, being a tropical product, is easily grown; the refining process is simple and inexpensive; and there are no duties of any kind to be paid in connection with its manufacture.

As stated, this cane-sugar supplied our needs for a very long time, till one year (1855) there was a failure in the crop, and prices went up. In that year, a new kind of sugar, which had been in use for some little time on the continent, came into notice. It was made from beetroot, grown in Austria, Germany, and France, which countries afford the peculiar atmospheric conditions necessary for its successful culture. That saccharine matter could be got from beetroot was a chemical discovery made during last century; but it was not till the French government specially encouraged sugar-manufacture that the discovery was greatly made use of; and in its infancy, beet sugar-making had to be fostered by enactments excluding its great rival, cane-sugar. After the beetroot—not the red kind we know so well, but a long white root—has been washed and trimmed, it is cut up, and lies soaking in water till the saccharine juice exudes from it. This liquid is boiled, treated chemically, and crystallised—the process being longer and more expensive than with cane-sugar. In use, however, the new sugar proved quite as good, and people soon discovered this. It was at this point that a somewhat mysterious thing occurred; not only was Austrian beet-sugar being sold in all the continental markets, but it came plentifully into our own, and at prices very much cheaper than cane-sugar. How this could be, English refiners were at a loss to understand; but the secret soon came out. It was this: In Austria and other foreign countries, sugar-refiners pay excise duties, just as whisky distillers have to do with us. Excise duty was levied on each refiner, not according to the quantity of beetroot he used, but according to the quantity of sugar he might be expected to get from it. A good refiner, however, soon discovered that, by growing better roots and by improving his machinery, he could make a great deal more from each ton of roots than the government calculated; and any sugar that he made beyond the government estimate of course went untaxed. This fact stimulated refiners still more to increase their exertions; and by-and-by the Austrian sugar-yield became too great for home use. Burdened with an excise duty, Austrian refiners found they could not send their goods to other countries to compete with our cane-sugar, which had no tax to pay. This was pointed out to the government, who, not unwilling to extend their foreign commerce, agreed to repay the duty on all sugar sent

abroad (*The Sugar Bounties*, by W. Smart, M.A.; Blackwood & Sons). With this arrangement the refiners were quite satisfied, as well they might, for a reason that presently emerged. Excise was calculated at so much sugar per so much beetroot; but under the new arrangement it was paid back simply on so much sugar. Now, as shown above, a great part of this sugar had paid no excise duty at all, and the money returned was simply a present to the refiner. With this unearned money, he was able in every market to undersell cane-sugar, which got no such favour.

Cane-growers soon saw that there was something wrong, and that the demand for their produce was rapidly falling off. They took active measures to cheapen cane-sugar as much as possible; but do what they might, the foreign refiner with his bounty at his back was able to checkmate them, and still make a handsome profit himself. Begun in an underhand way, the bounty system was continued openly, because these foreign governments saw with satisfaction that by its help their sugar-trade was increasing by leaps and bounds. So rapidly did things develop, that now beet-sugar, introduced only thirty years ago, supplies this country to the extent of six hundred thousand tons annually, while cane-sugar only gives us four hundred thousand tons.

We are now in a position to answer the question with which this paper started: Why is sugar so cheap? It is because certain continental nations virtually raise a heavy sum yearly, and give it to their sugar-refiners, to enable them to under-sell cane-sugar growers. This sum is estimated at about one million two hundred thousand pounds a year, extracted from the pockets of foreign taxpayers for our benefit, without counting that portion of the bounty which refiners may be supposed to retain as profit, but which they will disgorge if necessary to undersell cane-sugar growers.

Having answered our initial question, it might be as well to ask ourselves, what effect this bounty system has other than the lowering of prices? On the continent, there has been a great improvement in agriculture, owing to the efforts made in the better cultivation of beetroot. Then machinery has been made more effective, labour rendered more efficient, and men employed who might otherwise have been idle. But, on the other hand, it must never be forgotten that all that beetroot sugar has gained, cane-sugar has lost. Sugar-cane is not grown in the West India islands without much expenditure of labour and capital, and only after great care in planting and draining. All this will be lost if cane-sugar goes to the wall, and already sugar estates are falling out of cultivation. Again, the sugar-trade was the means of civilising these tropical countries, and should the growing of sugar cease, civilisation may be retarded, for the natives are too indolent to shift for themselves. All these facts have been clearly established by the evidence given before several Royal Commissions, and they are serious enough. Various remedies have been proposed, but any discussion of them in this paper would be out of place. It may be mentioned that the government are at present endeavouring to arrange an International Convention at which the matter might be discussed, and some plan adopted to put the sugar

industry on a better footing. The matter is one that concerns everybody, for every one is a consumer of sugar in some form, and the more information is spread about it, the better.

### SOME DOGS.

At a meeting of the British Association at Aberdeen, Sir John Lubbock read a very interesting paper on the Intelligence of Dogs, the main point of his discourse being that, in place of trying to make the dog understand us, we should endeavour to understand the dog. Sir John illustrated his lecture by an anecdote of his own dog, which, he told his hearers, was gifted with intelligence enough to choose correctly, out of seven cards denoting the different days of the week, that one which represented the actually present day. Sir John's dog, in fact, is very like our old friend the 'learned pig' of the fair in point of intelligence; but it has occurred to the writer, who has a considerable acquaintance amongst dogs, that it might be worth while to make public a few dog stories illustrative of canine intelligence, each of which, he thinks, is in no way inferior to that told by Sir John Lubbock. Without vouching for the complete truth of all the following anecdotes, the writer imagines, from his own experience of the animal, that where he has not been able to fully verify facts, there is at least no reason to doubt the *bona fides* of those who have related the following incidents.

The first dog of which I shall speak belonged (he is dead now) to an old friend of mine. He was a fine collie, called Nero. Like some other dogs of my acquaintance, he was in the habit of going to the butcher's each morning with his master, who always gave Nero his purchases in a fish-basket, to be by him carried home. One day it occurred to the master that Nero might as well be taught to go to market by himself. So he began each morning to say the word 'Butcher' very solemnly to Nero immediately before setting out; to which word Nero gravely listened, slowly wagging his tail the while. This went on for a few weeks with clockwork regularity. Then came a wet day. Nero was given his basket as usual, with a note in it asking the butcher—who had been warned beforehand—to exchange it for a pound of steak, and taken to the door. Then his master said to him 'Butcher,' enunciating the word even more solemnly than usual. Nero looked thoughtful and hesitated. He was then motioned off in the accustomed direction. Presently he went a few steps and looked back. 'Butcher, Nero, butcher,' repeated his instructor; and eventually the dog, after two or three false starts, went off with a rather dejected appearance, and my friend went indoors to await the result. In due time Nero returned with the steak; and for a year or two afterwards went to the butcher's almost daily, always bringing back his purchases without mishap.

There used to be a large black retriever belonging to one of the sailors at Greenhithe which I knew well. This dog was always to be seen on or near the little landing-stage, and he always 'begged' to strangers. Those who understood, used to give him a penny, with which he ran off to a little shop near at hand, whence he speedily returned with a large biscuit in his

mouth. This he always brought to the donor of the penny, or else to his master, never attempting to eat it until permission was given him. This, like Nero, was a dog which might have been taught much. He may be at Greenhithe still, for aught I know to the contrary; but it is some years since I have been there myself.

So many stories have been current during recent years of canine sagacity, that one is prepared to believe a great deal with regard to the doings and sensible proceedings of the 'friend of man.' A curious story of this kind has lately been told by the Secretary of King's College Hospital, London. He states that the porter in charge of the entrance hall was one day lately attracted by the loud barking of a dog at the door of the hospital. He found there three dogs, one very much injured and exhausted by loss of blood, and other two, who, it seems, had attracted the porter's attention by their barking, evidently friends of his, with nothing particularly the matter with them, for they ran away as soon as their object was accomplished. The injured dog had apparently cut his foot with a piece of glass, and he was traced by blood-marks to the spot where the accident happened. From this track it was clear that the animal had come by the shortest possible cut to the hospital, his two friends accompanying him to call attention to his condition.

Stories of doggie's affection are common enough; but I know of none more touching than that told by a Mrs C—, who once gave a favourite carriage dog to a friend to keep for her during her prolonged absence. The following is the brief of her story as told in the *Chicago Mail*. For the child of the family this dog conceived one of those preferences for which dogs, above all other animals of the brute creation, have been distinguished. He played with her, walked with her, ate by her, slept near her, followed her if she rode, and mourned inconsolably if she left home without him. It was the evil fate of this little child to contract the scarlet fever, and through all her illness the dog never left her side unless forced to do so, and then his cries were so unceasing that, for quiet's sake, he was admitted again to the sickroom. The little girl died; and her disconsolate friend laid himself at full length beside the coffin, rising now and then to lick the cold face. When the coffin was carried from the house, he followed it; and when the small mound that covered it was raised, he resumed his watch there. No entreaties could persuade him to leave it. He never tasted food again; and in the course of nature followed his little friend—it may be beyond the confines of that mysterious hereafter, where those who love are reunited.

Another dog-and-child story well worth repeating was lately told in the *Philadelphia Times*, full details being given, in case of any doubt as to the writer's veracity. Here the dog was a nearly full-grown bull-pup belonging to Mr Thomas McGlone, who resides at 1017 Locust Street, Philadelphia. Mr McGlone expresses himself 'willing to back him against the canine world for intelligence.' 'In the rear of Mr McGlone's house is a cellar twelve feet deep. The entrance to it is covered with a rickety trap-door. One day the little child of one of Mr McGlone's neighbours wandered into the yard,

and was enjoying a romp with the bull-pup, when it fell on the cellar door. The door quivered, and gradually sunk downward on its rusty hinges. The pup saw the child's peril, and springing forward, grabbed its dress between his teeth, and, bracing himself, tugged with might and main to pull the child back to terra firma. The door continued to sink, however, and the dog was not heavy enough to support the weight of the child. He seemed to realise this, but never wavered in his duty, and when the door fell with a crash, the dog and child went down together. The heavy door fell on the dog's back as he stood on the cellar floor with the child lying between his legs. The child's cries and the dog's howls attracted the attention of Mr McGlone, who rescued them both from the pit. The child was uninjured, but the dog was considerably bruised.' 'The pup undoubtedly saved the child's life,' says Mr McGlone, 'and his value has been appreciated in my eyes about one hundred per cent.'

Yet another story from America must be told here, though this time I am unable to give equally full details. Lion was a huge Newfoundland, whose mistress lives in Boston, and who gives continual proofs of his immense sagacity. The following is a case in point:

One day a lady called on Lion's mistress. During her call Lion came in rather slyly, lay down on the parlour carpet, and went to sleep. The conversation ran on, and the visitor said finally: 'What a handsome Newfoundland you have!'

Lion opened one eye.

'Yes,' said his mistress; 'he is a very good dog, and takes excellent care of the children.'

Lion opened the other eye and waved his tail complacently to and fro along the carpet.

'When the baby goes out he always goes with her, and I feel perfectly sure that then no harm can come to her,' his mistress went on.

Lion's tail thumped up and down violently on the carpet.

'And he is so gentle to them all, and such a playmate and companion to them, that we would not take a thousand dollars for him.'

Lion's tail now went up and down, to and fro, and round and round, with great and undisguised glee.

'But,' said his mistress, 'Lion has one serious fault.'

Total subsidence of Lion's tail, together with the appearance of an expression of great concern on his face.

'He will come in here with his dirty feet and lie down on the carpet, when I have told him time and again that he mustn't do it.'

Here Lion arose with an air of the utmost dejection and humiliation and slunk out of the room, with his lately exuberant tail totally crestfallen. Such is the story as told. Lion is probably a dog after Sir John Lubbock's own heart.

The following story was told as 'having the merit of truth':

A gentleman in one of our suburbs owns, or did own, a fine specimen of the spaniel breed, which is very fond of children, and which, when any little ones visit his master's house, constitutes himself their companion, playmate, and

guardian. A few days ago a lady with an infant visited the gentleman, and in the course of the day the child was laid on a pillow on the floor to amuse itself for a time. The dog took his place near the little one as usual. The day was hot and the flies many, and they made the baby the target of frequent attacks. This rendered her restless. Doggie watched her for a few minutes, and then, walking close up, with his nose or paw drove away every fly as soon as it lit on the baby's face, and this so gently as not to disturb her in the least. The dog's actions attracted the attention of the mother and others, who were filled with astonishment at his sagacious kindness; but to one who has watched the dog as I have watched him, his power of observation is never *surprising*, however wonderful it may be, and indeed is.

The value of sheep-dogs is well known; but I believe the one whose sagacity I am now about to commemorate stands out almost alone amongst his fellows. His master is a small farmer, and the proprietor of a single cow. For him the dog acts as cowherd. Each morning the dog's dinner is tied up in paper and fastened round his neck, after which he drives the cow to pasture. He remains near the cow all day, and as nearly as possible at mid-day he always slips the collar over his head, tears open his parcel, and eats his meal with the air of one who has earned it. Then he pushes the collar on again with his paws, and resumes his guard until dusk, when he drives the cow home. This story is vouched for by several people who have witnessed the whole 'performance,' and who know the dog well.

One or two of the above anecdotes have appeared in print, being published in a London newspaper to which the present writer communicated them some time ago. For the rest, I have said that I cannot exactly vouch for their complete accuracy; for in these days, one has to be very careful in guaranteeing the truth of even the most probable occurrences. I have in my notebook several stories of canine intelligence even more wonderful than any of the foregoing; but these I refrain from giving here, inasmuch as I have not been able to prove their truth, even to my own satisfaction. But I would say in conclusion, that a considerable experience of dogs has made me disinclined to refuse evidence to many a dog story which would strike the sceptic as highly improbable, so great is my belief in the animal's sagacity. And I feel convinced that any one who makes at all a careful study of the dog cannot fail to believe in his *reason* equally with myself; for there are things done by dogs which can never be explained as merely the outcome of what is termed animal instinct.

#### TRINITY HOUSE DINNERS.

AMONGST the muniments of the London Trinity House are some quaint entries showing how the 'Bretheren' of that corporation managed their eating and drinking arrangements in times past, and giving us an amusing insight into the economy with which these arrangements were carried out. It must not, however, be imagined from this that the Trinity House was stingy in providing for its guests; it was economical, and

that is quite another thing. Indeed, a friendly dinner or a friendly wine-drinking concluded the majority of its meetings, for whatever cause such meeting might have been held; and there is every reason to suppose that these entertainments were thoroughly enjoyed by those present. Take, for instance, the incidental allusions which Evelyn makes to them in his Diary. But at the same time we find the Master and wardens of the Trinity House generally careful to avoid anything like unnecessary lavishness in the conduct of their feasts. Thus, in 1670 it was decided that the dinner on 'Court' days should be paid for at a rate not exceeding five shillings per head, 'except on extraordinary occasions.' They allowed a little more when 'outsiders' were to be entertained; and for the dinner they were going to give on Trinity-Monday 1704 at 'the *Rummer*' in Queen Street, they sanctioned the expenditure of ten shillings per head for twenty-six persons, with a proviso, that if two 'extras' came, nothing was to be charged for them.

In dining by themselves, they would doubtless have been content with more frugal fare; and six years later, when affairs were presumably not in a very flourishing state, they took their annual dinner by themselves 'for ye good husbandry of the corporation.' Even in the money-spending days of Charles II., the 'Bretheren' had considered whether, after all, it was 'desirable' to so often invite 'courtiers' to their feasts. By 'desirable' they certainly meant, did they get a *quid pro quo* for the invitation? To derive some benefit from those they fêted was indeed a golden rule with the corporation, as is evidenced in their overtures to a certain wealthy Mr Merrick. He had already been a benefactor to the corporation; and on Trinity-Monday 1669 they had 'endeavoured to get him to dinner;' but in this they failed. Those were honest days, when people did not scruple to commit to paper the true motives for their actions; and so we find the clerk of the Trinity House making a memorandum in the minute-book to show good Mr Merrick some other attention, as he was 'a single man,' and if the corporation pleased him, might leave them 'something more at death.'

A little later, they settled that a present of wine would appeal most to the wealthy bachelor's feelings, so they asked a friend of his to dinner, and learnt what wines 'Mr Merrick did usuallye drinke.' These, it came out, were claret and canary; and a few days later, the 'Bretheren' sent him eight dozen of the former, and four dozen of the latter. History does not record if such delicate attentions had the desired effect. Let us hope they did, and that the corporation did not experience the occasional ingratitude of human nature.

No details of the 'fare' served at these Trinity House feasts in the seventeenth and eighteenth centuries have been preserved; but we learn from a Council order made during the time of the Commonwealth, that 'thre dyshes of good mete, and not more,' were at that time provided for dinner on ordinary occasions; and in 1660 we also find the corporation directing that 'two barrells of strong beer' should be in readiness 'for the election of the Master.' Among those who were expected to partake of the contents

were William Prynne and Serjeant Maynard. Drinking (we do not use the word to imply intemperance) formed a very important part of the ceremonial with the Trinity House on all occasions. Even when no meal was served after a meeting, we find that the 'Bretheren' 'refreshed themselves with a glasse of wine,' and then went to Deptford Church to hear a sermon. When two of the 'Bretheren' had a little disagreement, as Captain Crispe and Captain Crane had in 1671, a day was appointed for these gentlemen to attend 'and drink to each other,' and declare themselves reconciled. In 1665, the Court, finding the claret 'provided for the meetings not so pure or good as was expected,' ordered the wardens to lay in 'a tierce or twoe of such claret as might be approved of.'

There is one entry in the corporation minutes which suggests that 'courtiers' may have been inconvenient guests to entertain, for other reasons than the extra expense which their presence occasioned. Apparently, on accepting an invitation, they were in the habit, like the famous Mr Jingle, of ordering, if not actually what they would have for dinner, at least where they would have it; thus, we find the dinner on Trinity-Monday 1661 ordered to be kept at Stepney, if the Duke of Albemarle, when invited to it, 'did not order it in Water Lane.'

#### THE MONTH: SCIENCE AND ARTS.

MISS GORDON CUMMING, the well-known traveller, and sister to the 'Lion-slayer,' has recently published some interesting particulars regarding a successful attempt to teach the blind in China to read. It is estimated that there are more than half a million of blind persons in China, and this endeavour to afford them the solace of reading is due to the benevolence of Mr W. H. Murray. Formerly a sawyer in the south of Scotland, but more recently a colporteur of the National Bible Society, Mr Murray went in that capacity to Pekin. His system consists in the employment of embossed dots, and it is strictly phonetic, that is to say, the four thousand characters used in Chinese typography have been reduced to a comparatively few combinations of dots representing certain sounds. His first pupil was a street beggar, who learnt to read in six weeks. This experiment showed that the scheme was practicable, and in a short time afterwards a Blind School was opened in Pekin. It is worthy of remark that the scholars there learn to read with far greater rapidity than their more fortunate fellows who have the use of their eyes. Surely this fact should be a plea for that remodelling of Chinese typography which must come sooner or later.

On account of the state of the weather during the late eclipse, comparatively few observations were made. Very much disappointment has been expressed by the observers in consequence. Large sums of money have been spent on fruitless journeys and preparations; and even those observers who were provided with balloons, which it was thought would render them to

a certain extent independent of lowering clouds, were unsuccessful. One balloon got wet, and was too heavy to carry up the two persons in the car; and the other was met by torrents of rain, and had speedily to descend.

Monsieur W. de Fonvielle, an experienced French aéronaut, claims that balloons can be made very serviceable to astronomical science, and indeed he was the first to advocate their use for observations. He believes that, under skilful management, observers can be safely carried above any obscuring veil of clouds; but sufficient time must be given to the necessary preparations, and the balloon must be capable of carrying a large amount of ballast. It seems to be certain that photographs taken so far above the lower strata of the atmosphere would have a much better chance of success than those taken on the surface of the earth. The total eclipse of the moon which will take place in January next will afford an opportunity, of which many will doubtless take advantage, of testing the value of balloon observation.

An attempt has lately been made at Paris by MM. Jovis and Mallet to rise to a greater height in the atmosphere by means of a balloon than has ever yet been done. The aéronauts took with them a number of instruments for the purpose of making observations, and among these were a barometer designed to measure heights of upwards of thirty thousand feet, and a thermometer which would record temperatures fifty degrees below zero. A new feature was represented by the provision of bags of oxygen, for the purpose of inhalation by the aéronauts after attaining high elevations. It will be remembered that in 1862 Messrs Glaisher and Coxwell ascended from Wolverhampton for the purpose of making scientific observations from a balloon, and that they then reached the extraordinary altitude of seven miles above the earth. On this occasion, both the occupants of the car suffered very much, Mr Glaisher becoming quite insensible for a time. A similar experience seems to have been the lot of these French experimenters, one of them having fainted twice upon reaching the altitude of twenty thousand feet, the faintness being speedily mitigated after inhalation of the oxygen provided. The ascent was successful, but the height reached was far below that attained by Mr Glaisher and his companion, as already recorded.

A new kind of smokeless gunpowder has recently formed the subject of many experiments by the War Office authorities. This powder, the composition of which is a secret, is known as the Johnson-Barland, or for short, J.-B. powder. Its inventor claims that it gives greater velocity, flatter trajectory, less recoil, and less fouling than ordinary government powder. It will keep better, is safer to manufacture and to handle, and the weight is less than that of ordinary powder. Its inventor states that he will soon be able to produce a cartridge which complete shall weigh one hundred grains less than those now in use, while its performance shall be all that can be desired. In the recent experiments with the smokeless powder, it has been clearly demonstrated that several of these claims are based upon fact. There will be divided opinions among military men as to the advisability of using smokeless powder in warfare,

for, although the smoke must interfere with correct aim, it has often proved a friendly shield, under cover of which victory has been gained or life has been saved.

Now that we have come to the end of the long drought that has afflicted more or less a large portion of the country during the past summer months, it may be as well to inquire how long a time has elapsed since a similar occurrence of such absolute drought has been recorded. Mr G. J. Symons, F.R.S., writing from an observatory at Crowborough, in Sussex, states that it is more than forty years since the late absolute drought of thirty days in this part of Sussex was equalled. Mr Symons defines an absolute drought as a period of fourteen or more days with no measurable rainfall.

In response to the appeal of the Royal Society of Victoria and the Royal Geographical Society of Australia, the Premier of Victoria has consented to place the sum of ten thousand pounds on the estimates for the purpose of Antarctic exploration. It is intended to interest shipowners in the enterprise, and masters of ships will receive special bonuses for different services in connection with it. Thus, for every hundred tons of oil from fish caught south of a certain latitude, they will receive a sum of money. A special bonus will also be given to any master of a ship who will pass still nearer to the South Pole, and also for establishing on shore a temporary observing camp. Two ships will be required for this work, and they must be ready to start by the 15th of next October. The sum of money named above is promised on the condition that other colonies will join in this scheme, which it is hoped will give a strong impetus to Antarctic exploration.

According to recent advices, the Panama Canal scheme does not seem to be in such a flourishing position as its advocates and supporters recently endeavoured to prove. In one section of the Canal great difficulty has been experienced with the soil, which, owing to heavy rains, is constantly thrown back into the excavated channel, so that to a great extent the work already done will have to be done over again. Financially, the scheme seems also to be unsatisfactory. Up to the present time, five millions sterling have been paid as interest out of capital. It is estimated that at the present rate of progress the work will cost at least one hundred and twenty millions sterling; and the Company must earn five times the amount earned by the Suez Canal Company in order to cover their working expenses, interest, and other charges!

A paper was lately read before the China Asiatic Society by Mr Carles, lately vice-consul in Corea, giving an interesting sketch of that comparatively unknown country. He points out in this paper that, owing to the position of Corea between China and Japan, it has frequently been invaded by both countries. As a relic of one of these invasions, which occurred in the sixteenth century, there is a large mound at Katito, underneath which are buried the ears and noses of one hundred and thirty thousand Coreans. But the country is now left alone by its neighbours, and is independent. The people are said to be very peaceful, and to treat strangers well. The women are allowed to go abroad only in the evening, when all the men decorously retire indoors. The

country is so primitive that the people have few wants. They have no trade; there is nothing to invest money in, and apparently Corea is a paradise for the lazy. The men are addicted to drink, but still more to the tobacco pipe, which is described as the curse of the country. The Corean goes about his occupation with a pipe three feet long in his mouth; and whatever the nature of the work may be, whether digging with a spade or any other employment, the man devotes one of his hands to his precious pipe, which he will not relinquish for a moment. The result is that fifteen men do about the work of three Europeans. It is stated that the natural features of the country are very beautiful, and that the people take a great pride in it.

A correspondent of the *Times* points out that in the recent debate upon the shot-firing clauses of the Coal Mines Bill, the speakers seemed to be unaware that a form of cartridge can be and is now used for blasting without incurring the slightest risk, and he supports his contention by publishing a letter signed by a dozen colliery managers of North Staffordshire. This letter states that blasting by means of gunpowder has been given up in many of the mines in that district for years, that now a water cartridge fitted with an electrical firing apparatus is used, and that its adoption is daily increasing, two hundred thousand shots having been fired by this system without a single accident. With regard to cost, the new method compares favourably with the use of gunpowder and the old-fashioned fuse, and the coal so obtained is in as good a condition as under the old practice. But in addition to these advantages, there is a sense of security experienced by all engaged, from the knowledge that the water in the cartridge quenches immediately the flame caused by the explosion of each charge.

While the unfortunate English farmer has to complain of the numerous insect pests to which agriculture is subject, and which, owing to the late drought, have been more marked than ever, one pest at least has been found this year to be in a minority. Few wasps have been seen, except in some places where they are still abundant. At Maiden-Erleigh a wasp's nest, after having been smoked with sulphur, was recently dug out from a stack of turf. This nest measured the extraordinary size of thirty inches in circumference, and contained thousands of wasps! Its discovery was opportune, for a prize had been offered for the finest wasp's nest, at the Cottage Garden Exhibition in the neighbourhood, and this nest took the prize without any difficulty.

The Atlantic steamship *Umbria* has gone through an experience which, luckily, is not common. In mid-Atlantic the lookout observed a huge wave approaching the ship, and the course of the vessel was immediately altered, so that it might meet the wall of water obliquely. When the ship met the wave, it caused her to tremble from stem to stern; and the rush of hundreds of tons of water on the deck was so forcible that the thick brass rails on the bridge and the iron stanchions were twisted and broken, while the woodwork generally was crushed into splinters. Luckily, there was no loss of life; but there was a panic amongst the passengers during the critical period. It would be interesting to know

whence this abnormal wave came, and how it originated.

Dr Freire of Brazil, who has for the past seven years been trying to find a means of protection against yellow fever by inoculation, seems to have met with some success. Dr Freire works on the principle of M. Pasteur's methods—that is to say, he gets what is termed a culture liquid for the inoculation, and injects it subcutaneously. It is found that there is a mortality of about one per thousand for the inoculated, and one per cent. for those who have not been protected by the new method. In Rio de Janeiro, this year there has been no epidemic of yellow fever, a circumstance which has not occurred for the past thirty-five years; but how far this may be due to Dr Freire's system, it is impossible to state.

The introduction of liquid hydrocarbons for fuel on shipboard and to steam-boilers generally has recently made great headway. A series of experiments and tests are about to be made by Mr Thwaite, C.E., of Liverpool, and these experiments may possibly have great influence on the employment of liquid fuels in the future. The effects of air-supply, air and steam, and steam alone, will be considered, and the exact heat-value of different kinds of liquid fuel will be ascertained with precision.

In one of the Paris theatres, some new apparatus has recently been tried for the purpose of securing safety in case of fire. The apparatus is governed by an electrical circuit, which can be closed by push-buttons in various parts of the building. The act of pressing one of these buttons would be to drop the iron curtain that divides the stage from the auditorium, and at the same time to open numerous exit doors provided in case of panic. In case no one should have the presence of mind to touch one of these buttons, the heat of the fire itself will act upon certain portions of the apparatus, so that the curtain will come down and the doors will open automatically.

A new system of bootmaking has been introduced under the name of the Ab-intra Method. This word explains the method adopted; for the nails, of special make, are, by a machine, put in from the inside of the sole, so that the heads of the nails are towards the wearer's feet. This inner sole is then placed on the last with the points of the nails upwards, and the upper part of the boot is pulled over them and made fast with a special form of tool. The sole proper is then placed over the points, and is hammered down, the nails being then bent over upon the outside of the sole. It is said that the three portions of the boot are in this manner so closely united that it requires special appliances to separate them, the secret of this great amount of cohesion being in the form of nail employed. It is said that there is a great saving of time in this process.

Some months ago there was a panic in London regarding a case of wholesale poisoning by means of ice-creams, and if we remember rightly, the danger was traced to the impure water employed in making the ice. It has just been pointed out by an American doctor that the poisoning in such a case may be due to chemical action which takes place in the ice-cream freezer, and by which the zinc is dissolved. He has shown clearly, by

means of a galvanometer, that an electrical current under certain conditions will pass through the utensils used, and this current indicates that zinc is dissolved from one of the containing vessels.

Mr Ranyard, the well-known astronomer, has patented a new method of making wood pavement. The system has been suggested by the surface of an elephant's tooth, which it will be remembered consists of layers of hard substance intermingled with a softer material, so that, as the surface wears down, there is always a series of hard ridges upon the surface. Mr Ranyard's system comprises the use of blocks made of alternate layers of hard and soft material, which are set upon edge, so that the edges of these laminae constitute a wearing surface. These blocks are four inches thick, and they are made of alternate layers of Portland cement and a mixture of sand and cement. They will wear down gradually under traffic; but, unlike granite blocks, they will not wear smooth, but will continue rough, so that they can be worn down until less than one inch in thickness. This system is about to be put to rigid tests.

The *Scientific American* gives some account of a negro who is probably the oldest man now in the world. He was born in 1752, and remembers the rejoicing forty years later, when Washington was elected to the Presidency. Five years ago, when he was at the age of one hundred and thirty, he could do light work; but now he suffers from rheumatism, which prevents him walking; otherwise, he is in good health.

A German paper lately published a method of removing rust from iron, which appears to be very simple, and is said to be thoroughly effectual. It consists in immersing the article in a nearly saturated solution of chloride of tin, which, however, must not be too acid, or it will attack the iron treated. After removal from this bath, the metal must be washed in water, and then with a weak solution of ammonia. The iron so treated assumes the appearance of frosted silver, and is proof against rust.

A process has lately been discovered by which vulcanised fibre can be made sufficiently porous to be used in place of the ordinary porous jar in primary batteries. It is said that the electrical resistance of the ordinary Bunsen cell with a porous pot made of this fibre is only half as great as that of the cell in which a porcelain pot is used. It is believed that this porous fibre will be of great use for many other electrical appliances.

An interesting relic of the first London Bridge, which was erected in the time of William the Conqueror, has been dug up from the bed of the Thames in the course of some excavations which have been lately made at Botolph Wharf. This is a portion of one of the piles of the original bridge, which seems to have been oblong in section, instead of square, according to modern ideas. The wood is almost black, and is oak; but although saturated with water and blackened with its eight hundred years of immersion in mud and water, it is still fit for service, and might possibly do duty for another eight centuries.

At the Manchester Exhibition a new form of forge-hammer is exhibited. This hammer no doubt owes its conception to the well-known steam-hammer of Nasmyth, but it works by the

explosive force of gas. It will, if required, deliver one hundred and twenty blows per minute, each blow having a striking force equal to three hundredweight falling through a space of one foot.

#### A WEIRD PICTURE.

At the mouth of the beautiful loch which forms the harbour of Campbeltown, there stands an island called Davaar, about a mile or so in circumference. On the side facing Campbeltown Loch it slopes down to the water, but on the other sides it is precipitous. Its cliffs are indented with numerous caves, which are objects of interest and curiosity to visitors, as they are easily accessible at nearly all states of the tide to any one not afraid of a rather rough walk over boulders. In connection with one of these caves, there has, within the last few weeks, arisen an object of rather mysterious interest in the shape of a painting of the Saviour on the cross. The cave in question is a double one, the main cave being about fifteen or twenty yards in depth, with a separate smaller one opening into it about half-way in. In the recess formed by the junction of the two caves there is a curious flat triangular surface of rock exactly the size to contain the figure, with arms stretched on the cross; and it is almost a stroke of genius to conceive the painting of such a subject in such a place, as the subdued light entering by the smaller opening, dimly lighting up a recess which would otherwise be dark, gives the figure a weird and mysterious appearance, which is most striking and impressive. It is full size, painted in oil colours, and represents a full front view of the Saviour. It is a realistic work, and, so far as can be judged by the dim religious light, well and powerfully drawn and coloured. The discovery created a powerful sensation, and it has attracted an almost constant stream of visitors from all parts of Scotland. This sensation was heightened by the mystery attending it, no one knowing when or by whom the work was done. A gentleman named Mr Archibald McKinnon, however, has since acknowledged 'that I entered the double cave on the island of Davaar on several occasions, and painted the subject of "Christ Crucified" on the wall of the cave, in the most suitable place I have ever discovered for the purpose of portraying a subject I have long had at heart.'

#### R O S E S.

'I HAVE roses to sell! I have roses to sell!' The voice of the vendor grew faint as it fell. I went to my window and threw it up high, Because I loved roses and wanted to buy.

There were women and men speeding fast through the street,

The footways resounded with hurrying feet;  
I looked to the left, and I looked to the right,  
But the seller of roses was nowhere in sight.

'I have roses, sweet roses!'—I heard it again,  
And a little wan form hurried by in the rain;  
No friend to protect her—to shield her from harm—  
No wealth save the roses that hung on her arm.

She came to my beckon, so modest and shy,  
And blushed with delight when I offered to buy.  
I took the best blossoms; I gave what I chose;  
She knew not the value of even a rose.

'I would not take money,' she said with a tear,  
'If father were well, and if mother were here.  
I cannot help feeling—I've felt it all day—  
Ashamed to sell flowers that we once gave away!'

She fled, with a sigh, from my pitying sight,  
And hurried away in the gloom of the night;  
While I by her words was instinctively brought  
To ponder the lesson unconsciously taught.

Ashamed to sell roses! and yet, day by day,  
We are bartering treasures more priceless than they:  
The gifts God hath given—the best we have got—  
For perishing pleasures that satisfy not.

We sell our smiles to the rich of the earth,  
Our favours for what we conceive they are worth,  
Our talents for treasure, our nature for name,  
Our wisdom for wealth, and our freedom for Fame.

We are selling and selling—and what is unsold  
Is given on credit, with bond for the gold;  
It is 'nothing for nothing,' give nothing away,  
And count up to-morrow the gains of to-day.

Poor seller of roses! I see thee no more;  
Thy fate is a secret I cannot explore;  
Thy voice may be murmuring still in the night:  
'I have roses to sell—I have red ones and white!'

Ashamed to sell roses! Perhaps thou art now  
Where shame never flushes the glorified brow;  
Perhaps thou art breathing the sweetness profound  
The great Rose of Sharon dispenses around.

I know not; but, child, wheresoever thou art,  
Remembrance still claims thee a place in my heart;  
I think of thee often, by poverty driven,  
Ashamed to sell roses thou fain wouldst have given.

O, long may I follow that yearning of thine,  
To give, not to barter, the things that are mine;  
And when the dark river rolls down to the sea,  
The shore may be golden for me, as for thee.

NANNIE POWER O'DONOGHUE.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. For its return in case of illegibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if illegible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them, IN FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of illegible papers.

## FROM A FIELD-GATE.

A GLORIOUS afternoon it is, the hottest of mid-summer, with not a shadow in the dazzling blue of the heavens. Who could sit at a desk with the white butterflies flickering in and out at the open window, the sweet breath of the clove-pinks filling the air, and the faint gurgle of the river coming up from the glen below? The gardener has long ago left off weeding the lawn borders, and betaken himself to the cool planting-house; Jug the spaniel lies panting out there with lolling tongue in the shadow under the rhododendrons; and the leaves of the aspens themselves seem tremulous with the heat. It will be pleasanter to go up through the wood to the end of the lane, to sit under the edge of the trees there on the trunk of silver birch that serves for a cattle-gate, and enjoy something of the southern *dolce far niente*, with a pocket copy of gentle Allan Ramsay to finger through.

How very quiet the spot is, with the wood behind, and the flowery fields sloping away in front! Not a murmur comes here from the city, whose smoke rises, a murky cloud, far off in the valley yonder. The streets there will be stifling to-day amid the hot reekings of asphalt pavements, the sifting particles of burning dust, and the incessant roar of traffic. Here, above the fields, the air is sweet with the scent of clover; the stillness is only broken by the faint pipe of a yellowhammer sometimes in the depth of the wood, and the blue heavens shed their peace upon the heart. Nothing but the faintest breath of air is moving, just enough to stir gently the deep grasses of the hayfield, and to touch cheek and lip now and again with the soft warm sigh of the sweetbrier in the hedge. Gleaming flies, green and yellow, with gauzy wings, float like jewels in the sunshine; a shadow for a moment touches the page as a stray rook drifts silently overhead; and on the edge of the great yellow daisy that flames over there like a topaz among the corn, a blue butterfly lazily opens and shuts its wings.

This is the silent month, they say, because the

birds have nested and foregone the twitterings of their courting-time; but from the lark up yonder, a quivering black speck in the sky, there is falling a perfect rill of melody. What is he exulting about, the little black speck? Is it for sheer gladness in the happy sunshine, or is it because there is a little helpless brood of callow laverocks in a nest somewhere below among the clover? Glad little heart! sing thy song out while the blue sky smiles above thee. Thou hast forgotten the pinching of the winter cold, and why should thy rapturous hour be saddened by taking thought for the dark things of the morrow. Under the hedge close by, an occasional rustle of dry leaves and an admonitory cluck betray a brood of chickens surreptitiously brought into existence by some lawless and absconding hen; and on a twig a little way off, a young sparrow with fluttering wings gapes its yellow beak for the attentions of a proud and sprightly parent.

In the distance, from the bottom of the next meadow, comes the faint whirr of a mowing-machine. It and the reapers are out of sight; but on the level beyond, the ryegrass lies in long white lines winnowing in the sun. Well may that harvest be the first to be gathered, for it is the share that falls to the faithful dumb friends of man. Meanwhile, the farmhorses left at liberty in the grass-field yonder are evidently, like many honest souls of another genus who have worked hard all their lives, quite at a loss what to do with their late-acquired leisure.

On the dike-top here, the clover, with great ball-blooms of rich pink, is growing beside the purple-toothed vetch and the small yellow stars of another unknown flower. In the hedge, among the heavy-scented privet blossoms, are flowers of pink wild-rose delicate as the bloom of a girl's cheek, with full pouting buds red as lips that would be kissed. White brier-roses there are, too, as large as crown pieces, and great velvety humble-bees are busy botanising among their stamens. The bees prefer the newly opened ones, however, whose hearts are still a rich golden yellow. Below, among the woodland grasses, the

white dome-clusters of the dim-leaved yarrow are flowering amid a miniature forest of green mare's-tails and the downy stalks of the hemlock. Gardeners are only now beginning to see the beauty of the yarrow for deep borders, as they are beginning to see the beauty of the foxglove and the glory of the broom. Over there in the side of the wood-ditch are springing delicate tufts of spleenwort; and already the flower-fronds of the hard-fern are rising from the nest of their dark-spread fellows. The graceful heart-shaped nettle leaf appears there too, with its purple stem, beside the tall magenta-coloured flowers of the bastard-thistle.

A pleasant retreat, indeed, is the spot; and through the tangled wood-depth, of a moonlit night, might be expected to come the revel court of Titania. Is not that one of her furry steeds, with velvet ears erect and bright wide eyes, cropping the green blade in the grassy lane path? Her sleek chorister, too, the blackbird, has forgotten to be timid as he hops across the ruts there, waiting doubtless for her coming. Whir! What a rush of wings! It is a flight of starlings disturbed from the grass-field below; for these birds bring their young out to the fields this month in flocks of hundreds to feed. Round and round they wheel in the air, as if delighting in their power of wing, before finally settling on the grassy knoll a hundred yards away.

A sunny knoll that is, where the birds feed undisturbed to-day, a small point in the landscape; yet it has a page of history to itself. On its summit once stood a Scottish queen, surrounded by a little group of nobles, watching, a mile to the north, the die of her fate being cast, the arbiter of life or death. Two armies lay before her. Far off about the little village in the bosom of yonder hill she saw two dark masses gathered, with a battery line of guns between them. Those were her enemies; and one of the horsemen behind them—it was only a mile away—she knew was her own half-brother. Nearer, on the lower rising ground, that the railway cuts through now, she saw her own troops gathering, a larger force, but without the advantage of position. And the queen watched and waited; it was about nine o'clock of the morning. Presently, a cloud of smoke sprang out between the armies, and immediately was heard the roar of cannon; the duel of the artillery had begun. During half an hour little could be seen for the smoke, and there was a constant explosion of ordnance. It must have been an anxious time. Suddenly, however, the firing ceased, the smoke rolled away, and the battlefield could be made out. The queen's cavalry had formed into line, had charged, and were driving the enemy's horse before them. Then a tear sprang to the queen's eye as she saw her vanguard leave the hill, cross the open ground among the furze, and, with their gallant leader at their head, rush to storm the village. They disappeared in the narrow lane, where the new church stands now in the hollow of the hill, and there could only be heard faintly their shout as they closed with their opponents, and the shot-reports of the enemy's hagbutters firing at them from the hedge-gardens and the village roofs. How was the day going? See! the enemy's wing was wavering, was giving way. Fight on, brave fellows! brave

vanguard! press them hard. A few moments longer, and the day is yours.

But look! A horseman gallops to the other wing of the enemy, where the Regent is riding. It stirs; it moves down upon the village. Ah, where now is the queen's reserve? Why does it remain inactive and aloof? Are its rival leaders quarrelling over petty precedence, or is there treachery in its ranks? The battle closes again about the narrow lane. The vanguard is attacked on either flank—it is overborne—it gives way. See! they are broken; they pour back out of the lane. Wounded, weaponless, they are fleeing, and with a yell their foes are upon them, cutting them down. But the reserve is moving at last; it may bring help; it may yet retrieve the hour. Ah, cowards! it breaks and scatters. The day is lost. Away! then, away, poor hapless queen! Ply whip and spur for thy life. Neither here nor anywhere in all thy fathers' kingdom of Scotland is there safe tarrying-place for thee now. And may heaven help thee in the hour of need, for thou wilt find small help in man or woman.

The starlings are feeding this afternoon on the Court Knowe, the hillock there, undisturbed, and it is three hundred and nineteen years since the stricken queen rode away through the hollow yonder where the green corn is growing. The suburbs of the city are spreading even over the battlefield itself. But ever and again, upon a summer day, there comes a pilgrim to stand a while in pitying silence on the little knoll under the trees, and to recall something of these 'old, unhappy, far-off things,' as he reads upon the stone there the royal monogram, and the date, May 13, 1568.

Clouds, however, are beginning to gather in the sky; a pair of swallows are flying low, skimming the grasses for insects under the edge of the wood; and the hoarse note of the cornrake comes from the middle of the clover-field—signs, all these, of coming rain. The hay-makers are hurrying their harvest into small stooks, and a cool wind is rustling the *bratrd* of the corn. The sun is setting, too, and the sound of the tea-bell comes up through the wood. It is time to go home.

## RICHARD CABLE,

THE LIGHTSHIPMAN.

BY THE AUTHOR OF 'MEHALAH,' 'JOHN HERRING,'  
'COURT ROYAL,' ETC.

### CHAPTER XLIV.—A ROLLING STONE.

RICHARD CABLE started homewards. He had ridden his cob to Exeter, and brought him on thence with the cattle by train. Now he drove him all the way back from Somersetshire to St Kerian, but not with the van full of calves the whole way, for he sold them all before he had reached Launceston. Then, instead of going on, he bought up young cattle in Devon, to the north of the road, where is also a wide tract of very poor clay soil, worthless except for rearing stock. In the north of Devon the soil varies to such an extent that one field may let for five times the price of the field next to it. Where the red soil runs, there anything will grow; where the white clay lies, there nothing will thrive. Now, after the old Roman road from Exeter to Launceston

passes North Tawton, it leaves the red soil for ever. On the south of the road is good land—crops wave, and trees grow to stately dimensions; for there limestone and volcanic tufa break out and warm and enrich the soil above. To the north of the road is clay, and clay only, to the ocean, where crops are meagre and trees are stunted. Cable's eye had been sharpened, and he learned and took in much as he went along the road. Having bought young stock from the poor land, he turned his back on the west, and drove them to Exeter, and trucked them on to Somersetshire again; but not this time to Bewdley and Bath, but to the neighbourhood of Wells. He sold these readily enough; and then he bought more calves and trucked them to Exeter, where on this occasion he had left his cob and van; and then drove them to Launceston, disposing of most of them before reaching home.

From Exeter he brought with him seven pairs of new shoes, with perfectly clean smooth soles, of a pleasant brown; and ever and anon, as he drove in his van, with the calves bleating behind him, he opened the bag that contained the shoes, and took them out and counted them, and kissed the soles, thinking of the little feet they would clothe when brought to St Kerian. Richard had to halt continually on the road and buy milk for his calves, dip his fingers in the milk and let the calves suck them. It was tedious work; but it would have been less tedious to another, for no other was drawn homewards by such strong fibres from his heart. At length he arrived within sight of St Kerian, and drove through the village street. The innkeeper came out to ask what luck he had had. 'Middling,' answered Dick; but he did not halt at the inn-door. Then out of his smithy came Penrose the blacksmith with a cheery salute and his big black hand extended.

'Well, Cable, glad to see'y' back. The little uns are all peart [bright].'

Richard nodded. He held the reins in one hand and the whip in the other; he did not accept the offered hand, but drove on.

'What, Mr Cable!' exclaimed the parson, who was on his rounds. 'You're home again! I'm glad to see you have a carriage.—Your mother is fairly well, and the children—blooming rose-buds.'

'Thanky, sir!' Richard put the handle of his whip to his cap, and drove on.

'Dicky!' shouted Farmer Tregurtha over the hedge, 'so you're home with your pockets lined with money. I must look out for Summerleaze, or you'll snap it away from under my feet.'

'I take nothing for which I cannot pay,' answered Richard; then he turned a corner and stopped the van, whereat the calves, thinking it meant milk and a suck at his hands, began to bleat. But he was not thinking at that moment of the calves. He saw before him the cob cottage, the limewashed walls gleaming white in the sun, and before the door stood Mrs Cable with little Bessie in her arms, and about her the rest, looking down the road with eager eyes.

What a cry of delight when their father appeared with his van and cob! Little Bessie struggled in her grandmother's arms and clapped her hands; and Mary, his dear Mary, came to him with expanded arms, scudding along like a seagull, and dived into her father's arms, clung

about his neck and heart, and buried her face in his. Never would he forget that moment, that spasm of pride, that rapturous leap of his heart in his breast as he saw her coming on, and shouted: 'No!—not in Somersetshire, not anywhere, is there such another little Mary!'

What a happy evening that was, with his children clustering round the calves, dipping their hands in the milk and laughing, but first shrinking at the mouths of the young creatures sucking their hands! Little Bessie must pat the calves, and she quite fell in love with a young dappled Guernsey. What a pleasant supper when they all sat round the table, but not before there had been a slight scuffle which should sit beside their father! Was there ever so dainty a dish served up at Hanford Hall whilst Richard dined there, as that great bowl of potatoes and turnips that now steamed in the midst of the table round which the bright and happy faces smiled and shone! Then, when supper was over, came the trying-on of the new shoes; and each in turn sat on her grandmother's lap, whilst Richard knelt on the slate floor and fitted the covers on to the dear little feet he loved so well. For Bessie there was a pair of glazed patent leather that shone like sticking-plaster, and they had rosettes with steel buckles and beads over the instep. Bessie laughed and danced in her grandmother's arms, and then cried to be held by her dada; and clung fast to him, and would not be put down or go to bed till he undertook to undress her, wash her, comb her hair, hear her prayers, and sit by her till she fell asleep.

The happiness was of short duration. Next morning, Richard went farther with his van and cob and calves, to the *Maggie*, to give an account to Jacob Corrye of what he had done, how he had succeeded, and what he proposed to do.

'There, now,' said the landlord of the *Maggie*, when he heard the results and saw his money. 'I be glad, I be, to handle the cash; but I be main better pleased to know that what some say are the maggots in my head have turned into butterflies, and not blue-bottles.'

After that, of course a second venture was agreed upon. Richard was to remain a week at home, make what arrangements he thought necessary for the children, and then start again on the road by Launceston to Exeter, driving young cattle before him. He was now eager to be gone. Not that he desired to be away from his family, but that his ambition was fired. He was resolved at no very distant date to secure Summerleaze, and build thereon the house which he had seen in a dream, and which he had declared to Tregurtha he intended to build. How many times had wild ambitions and vague aspirations rushed through his head, and found expression on his lips, and nothing had come of them. One night a dream had passed before his sleeping eyes, a jumble of impossibilities, it might be thought, and now that dream promised to realise itself.

Throughout the week he was at home, Richard was silent concerning one matter. He was ready to talk to his little ones about what he had seen—concerning the children of Mrs Stokes, the whirligig he had come across at Okehampton, and the grand cathedral at Exeter, and the piebald

horses of a circus that had passed him on the road, and the militia reviewed at Wells, and the hot springs with foul smell at Bath; and he had told his mother of his difficulties and of his successes, of his mistakes and of his gained experiences, of his prospects for the future, of the certainty of his insuring a small fortune; but he said not a word about the discovery he had made at Bewdley. Nevertheless, that discovery troubled his mind and kept him wakeful at night. It was a discovery that perplexed him beyond power of setting to rights. Why was Josephine in service? If in service, how came she to be singing and playing in the drawing-room that night? He knew so much of the ways of good houses as this, that a lady's-maid is not expected to sit down to the piano in the room with her mistress. He also knew so much of Josephine as this, that for her to associate with such creatures as Mr Polkinghorn would be unendurable. He thought of his own Polly: perhaps the maids at Bewdley were like her. Polly was a good girl, fond of work, and fond also of finery when she could get it. Polly had not been blessed by heaven with much mind, and what little mind she had was uncultivated. She could read, but read only trash—police intelligence and novels. She could write, but not spell. She could talk, but not of anything beyond village gossip. Could Josephine have borne the daily society of Polly, could she breathe in such an atmosphere of vulgar interests?

Either Josephine was very much other than what he had supposed, or she was now completely out of her proper element, and suffering accordingly. It was possible that her pride, her headlong self-will, coupled with pride, had made her throw up all the advantages she had got by the will of Gabriel Gotham. Richard recollected now that she had told him her mother's fortune, which ought to have come to her, had been mismanaged and lost. It was by no means impossible that Mr Cornelius, for whom Richard entertained the greatest aversion, might have met with a reverse and be ruined. Then, how was it that Josephine, being so close a friend of the Sellwoods, was allowed by them to drop into a menial situation? They were well off, always ready to do what was kind, and be helpful to those in distress. Yet it was the Sellwoods who, according to Mr Polkinghorn, had recommended Josephine to her present place.

'I wish I could have seen her,' mused Richard. 'It would be painful to me—but for all that, I wish I had seen her; and when I go back again to Bewdley, I must try and see her without letting her see me. I'd like to know how she bears the change. I'd like to see how she looks—as a servant.' He laughed. 'And to be considered a low lot!'

Dicky Cable did not go near Bath on his second expedition; he went into another part of Somerset. He was away for some time. After this, he was able to stand unsupported by Jacob Corye. He became a cattle-jobber on his own bottom; but he always dealt for Corye whilst dealing for himself, and to Corye he always gave double profits, for it was the landlord of the *Maggie* who had put the plum into his mouth. He began to turn over money very fast. He had a good deal of expense on his journeys: he had to lodge himself

and his horse, and feed his young stock and give skimmed milk to his calves; and the railway carriage ran away with money; and the seven little mouths at home cost more every day, for appetites grew with their bodies, and their clothing and shoeing cost more also. Nevertheless, Cable put away money.

But we are looking too far ahead. He had not started on his own foundation when Christmas came; he did so with the New Year.

The opinions of the St Kerian people underwent a change respecting him. Some were glad at the improvement in his circumstances; but others begrudged it. Most wondered that he should have done what was now obvious to all; they were uneasy at his having got his feet on Luck's road, when there were so many worthier men, such as themselves, who wandered in Poverty Lane. Now, those who formerly had not noticed him, nodded when he passed; and those who in former days had nodded, shook hands; and those who had in the time when he broke stones shaken hands, now asked him to lend them money, which was the greatest mark of esteem they could show him. The St Kerian folk were in that transition mood in which it would take very little on his part to bring them into the most cordial relationship, and make them forget that on one side he was not a true-blooded Cornishman. The women were specially disposed in his favour, because he had proved himself so tender and true a father to his orphan girls; and some were most especially so disposed because they considered him to be a widower. But Richard Cable took no notice of the revolution. He called at none of the houses of the villagers; he scarcely spoke to those whom he passed; he returned their salutations without cordiality; and he never went to the public-house, which was the more to be marvelled at, because, whilst from home, he lived entirely in taverns. Perhaps that was why he cared for none when at St Kerian, and spent all his available time in his cob cottage among his seven little maids.

Christmas came—the second since Richard Cable and his family had been at St Kerian. The first saw him in great poverty, without prospect of betterment; the second shone on him with a future opening before him; but it did not find him, for all that, with a more softened and Christmas-like spirit. He arrived at home on the eve.

Over the great fire that burned on what is locally termed the 'heath-grate' hung a caldron, in which was boiling the plum-pudding for the morrow. Cable sat in the armchair by the fire, with little Bessie on one knee, and Susie on the other, with Lettice standing in the chair behind him, scrambling up his back, and the four other children sitting on their stools in a semi-circle round the fire. They were in neat stuff frocks, with clean white pinafores over them. The father was full of joy and fun, when a tap came at the door, and some neighbours entered to congratulate him on his return and to hear the news.

They stood before the fire, thrusting the little girls aside, talking, asking questions, hinting pretty broadly their desire to know how his affairs went—well-intentioned visitors, with kindly meant inquiries, but vexing to Cable, who did not

care to be disturbed. He answered shortly, with gravity; he showed no pleasure at the visit; he put aside their questions unanswered. He did not ask the intruders to be seated and take a pipe; so that, after a few minutes, somewhat disconcerted, they retired. An opportunity for conciliation had been offered, and rejected.

Richard Cable had never cared for the society of his fellow-men, even in the old days, but then he had not shunned it. Now that he had entered on a business which took him among men, he valued his privacy more than formerly. He was not at home for very long, and whilst there, he desired to be left alone with his precious ones. The St Kerian people were not travellers; they remained stationary where their fathers had stood, and their grandfathers before them. Richard Cable had become a rolling stone, after having fallen among them with every promise of becoming a fixture. The proverb says that a rolling stone gathers no moss; but the St Kerian stones collected very little, and Cable at every roll came back with the gold moss clinging to him. A rolling stone he was, stony to all he encountered, hard, unyielding; but with his centre of gravity never displaced, always drawing him towards the cob cottage; and when he was there, there was nothing stony about him, there he was soft, soft as moss.

Scarce had the visitors gone, when another rap came at the door, and before he had called to enter, the door flew open, and in danced several mummers. St George, with a tin pot and a cock's feather for helmet and plume, and a fishpan lid for shield, and a red shawl for mantle; the dragon of pasteboard, overlaid with tinfoil. King Herod with a gold-paper crown and corked moustache and beard. Beelzebub with a black sweep's suit, and complexion to match. Some of the smallest of the children began to cry—Bessie and Susie, who were on his knees; Lettice stood behind him, peering over his shoulder, feeling herself safe behind such a bulwark; but the others laughed, jumped about like kids, and clapped their hands. Cable would have driven the mummers out; he threatened them; but Mary and Martha interposed and entreated him to let them see the show. Then ensued the old-fashioned masque of St George and the Dragon, in doggerel rhyme. The mummers were all boys, and they had learned the traditional play by heart. They recited their parts without much animation and action, as though saying their collects in Sunday school. It was dull fun to Cable; but it delighted the little maidens, their delight reaching its climax when Mary cried out: 'Oh! I know who St George is! You are Walter Penrose.' Thereat St George interrupted the performance to pull a huge, red-streaked apple, a quarendon, out of his trousers-pocket, and present it to Mary with a bow and a laugh: 'And this is St George's Christmas present to little Mary Cable.'

Then the demon brandished his club, made of sacking, enclosing hay, and, banging the performers with it right and left, shouted at the top of his voice:

'Up and cometh Beelzebub,  
And knocketh them all down with his club.'

Whereupon the mummers danced out of the

door. Then Richard Cable stood up, put down Bessie and Susie, shook off Lettice, and went to the door and put the bolt across it and turned the lock.

'O father!' cried Mary, 'wasn't that kind of Walter? He is so good! He always gives me sugar-plums whenever I see him.'

'My dear Mary,' said her father, 'I object to you receiving any presents from any St Kerian people. Walter—— Is he the blacksmith's son? Well, the time will come when you will hold up your head too high to take apples from and play with the sons of common village blacksmiths.— Throw that apple away!'

'O father!' cried all the little girls together. 'Don't say that,' pleaded Mary. 'Take out your knife, father, and cut the apple into seven.'

'Very well,' he said moodily; 'this time, but this only. Let it be the last; and understand, Mary, that you take nothing again from Walter Penrose or from any other St Kerian child.'

'But, papa,' said little Mary, 'Walter is so kind, and when we get old, I am going to be his little wife.'

'Never,' said Cable angrily—'never.' Then, all at once, uttered burst forth the song of the Christmas carollers:

'Hark! the herald-angels sing  
Glory to the new-born King,  
Peace on earth, and mercy mild,  
God and sinners reconciled.'

But Richard Cable did not open the door and look forth, and wish the singers a glad Noël, and offer them plumcake and a jug of cider. In all his children's eyes looking at him was trembling entreaty, but he heeded it not. He sat by the fire, looking gloomily into it.

Then the seven little girls raised their voices, and sang inside the cottage, along with the choir without:

'Joyful, all ye nations rise,  
Join the triumph of the skies;  
With the angelic host proclaim,  
"Christ is born in Bethlehem."

'My children sing better than the trained choristers outside,' said Cable to himself. He sat motionless, though the carollers waited without for their Christmas greeting. They did not get it. The rolling stone was stony indeed; and the more it rolled, and the more the prospect of gathering gold moss opened before it, the more flinty it became.

Then the choir went away; and the hushed children and their silent father heard the singers carolling before another house half a mile away. The music came to them faint and sad. There was no peace, no mercy mild and reconciliation in the heart of Richard Cable that Christmas eve.

## RUSSIAN FISHERIES.

In the Arctic regions, so greatly does fish preponderate over all other kinds of food, that the people there have often been grouped together under the name of Ichthyophagi, or fish-eaters; and there have been naturalists who have followed this idea so far that they have been able to discover a fishy type of physiognomy among them. Some of these

people in the course of their lives probably never taste any other kind of food; and as its peculiar richness in fat especially adapts it to their requirements of an easily digestible heat-giver, it is well that nature has been so lavish in peopling the waters. So numerous are the individual members of the finny tribes, that they may be said to exist in their myriads, thus forming a striking contrast to land animals, which are comparatively scarce. This abundance of fish arises from the evenness of temperature of water as compared with land. Seaweeds grow luxuriantly in latitudes where land-plants of any importance would be an impossibility, and thus the primary requirements of a large population of animals are supplied. If it were not for this supply of seaweed, it is not too much to say that the Arctic regions would be almost uninhabited; but, thanks to the consequent abundance of fish, the Eskimo and the Samoides extend themselves to within ten degrees of the Pole.

In a cold country like Russia, three-quarters of which has a mean annual temperature of only forty degrees—that is, of only eight degrees above freezing-point, and nearly half of which has a mean January temperature of more than twenty-two degrees of frost—there are millions of people who must depend on the sea, the lakes, and the rivers for a very large proportion of their daily food, and who rarely if ever partake of animal food except in the form of fish. To them, the takes of salmon, pike, shad, herring, cod, haddock, and dorse are as much a harvest as the harvest of the fields is in more favoured regions. St Petersburg, indeed, is the metropolis of fish-dinners; nowhere else can fish be placed on the table in so many different forms, and nowhere else can so many fish-delicacies be procured: there, you may have endless varieties of fish-soups; fish baked, boiled, steamed, stewed; fish-salad, fish-pies, fish-brawn, potted fish, marinated fish; fish fresh, salted, dried, smoked, or frozen; and when you have got through the catalogue of most European fish, you may begin again with preparations of fish-roe.

The Arctic Ocean and the White Sea are extremely rich fishing-grounds, and furnish most of the trade of Archangel. The fish of this region comprise the salmon, herring, cod, whiting, tusk, coalfish, ling, pollack, and dorse, many of which are sold as stockfish. The Baltic is not so rich, and supplies no stockfish except dorse.

But it is in fresh water that Russia stands pre-eminent in Europe. Besides the fresh-water fish, there are the fish, such as salmon, sturgeon, eels, and so on, which ascend the rivers at certain seasons. Each river is let off in sections to farmers, some of whom are great capitalists; while others are obliged to advocate the principles of co-operation, or to fish alone. Some rivers—the Volga, for instance—are strictly considered as Crown monopolies; others are reserved to the nobles and the townships; but fishing licenses form one of the most remunerative sources of Russian revenue.

The Volga is the richest fish-river in Europe. Its length is 2200 miles. Other rivers are—the

Petchora, 900 miles long; Mezen, 480; Dwina, 760; Omega, 380; Dniester, 700; Bug, 340; Dnieper, 1200; Don, 1100; Kuban, 480; and the Ural, 1020 miles in length respectively. Besides these giants, there are hundreds of rivers which may vie in size with our own Thames and Severn; and then there are thousands of sheets of fresh water, for a great portion of Russia belongs to the Baltic region of glacier-formed lakes. These range in size from mere ponds to such a sheet of water as Lake Ladoga, which covers an area of 6330 square miles, which is equal to more than three-quarters of the extent of Wales. Then there are—Omega, 3280 square miles; Saima, 2000; Peipus, 1250; Enara, 1200; Bieloe, 420; Ilmen, 390; and Pskov, 280. Our own largest lake is Lough Neagh, in Antrim, which only covers 153 square miles. Nor are the Russian lakes mere gigantic horseponds, which might be drained as the Dutch lakes have been; but, like most glacier-formed lakes, they have considerable depth. Ladoga has a maximum depth of one thousand feet; while several of the others range down to eight hundred.

From these statements, it will be seen that the aggregate amount of fresh water in Russia available for fisheries or for fish-culture is immense; and it is everywhere thickly studded with pike, salmon, lake-trout, shad, thicksnouts, red bream, perch, and carp; while the larger rivers also yield sturgeon.

The Russian is to some extent prevented from settling down as an agriculturist by the amenities of his climate, but more by his old nomadic blood, so that, in spite of the immense strides which civilisation has made in Europe, he alone is still a semi-savage. He still prefers a semi-nomadic employment to farming, and the fresh-water fisheries meet his requirements.

In the south-east of Russia is the greatest salt lake in the world, the Caspian Sea, which has an area of 130,000 square miles—that is, an area greater than all the British Islands put together, with an additional island larger than England thrown in extra—is intimately connected with the fresh-water fisheries of the Volga and the Ural; for the fish migrate from fresh water to salt, and from salt to fresh, there as elsewhere. The great fishery of this region is that for the sturgeon (*Accipenser sturio*), and its kindred the great sturgeon or beluga (*A. huso*), the sewruga (*A. stellatus*), the osseter (*A. Guldendstadti*), and the small sturgeon or sterlet (*A. ruthenus*); also for the salmon, white salmon, and knife-fish. The sturgeon family attains to an enormous size, especially the beluga, which sometimes measures twenty feet in length, and weighs two thousand five hundred pounds, though specimens of over one thousand pounds are rare. The sewruga is also a giant; but the other sturgeons are seldom taken above six feet in length. The number of these giants disposed of annually at Astrakhan has in some years been enormous—three hundred thousand sturgeons, one hundred thousand belugas, and millions of the others. No wonder that there are complaints of the failure of the supplies, and, as is usual where ignorance prevails, the mischief is attributed to every cause but the right. 'It is because of the steamboats!' says the moujik, and forthwith the moujik hates the sight of a steamboat. But steam or no steam, the sturgeon of the Caspian may

soon become as rare a curiosity as Thames salmon.

Astrakhan, the principal Caspian port, is one of the most important fishing-stations in the world. From this region alone the Russian revenue nets about a million pounds sterling for fishery licenses; and during the fishing season, twenty thousand strangers, ranging in degree from simple labourers to gigantic capitalists, come in to compete with the regular inhabitants for the profits from the fish industries.

The fishery-trades are systematically pursued in Russia, since so much of the national life depends on these industries. As a general rule, a Company of capitalists begins by forming a fishing-station (*utsching*); and here they make a dam; they catch the fish; they manufacture nets, harpoons, traps, and lures; they convert fish-refuse—heads, bones, scales, entrails, and sounds—into glue, gelatine, and isinglass, or even into manure; they split, clean, salt, smoke, or freeze the fish; and they distribute them through the country to their agents for sale, much of this latter work being done by sledges in winter, to save freight. They also pursue the more lucrative fish-industries, such as manufacturing the finest kinds of isinglass and gelatine, as well as that curious fish-product known as caviare. 'Twas caviare to the general,' wrote Shakspeare, when the Russian Company of London introduced it to this country; and unless men train themselves to like it, just as they train themselves to eat olives, they are still likely enough to splutter when they get a mouthful of it. Caviare is the roe of the sturgeon tribe of fish; but salmon and pike roes are usually added, to assist in increasing the bulk. The roe is cleaned, then washed with vinegar, salted, and dried, when it is packed in casks. The best quality is prepared more carefully from the sturgeons alone. The salting is conducted in long narrow bags of linen, which are hung along a cord and half-filled with roe. A very strong brine is then poured into each bag until it overflows. When the brine has all passed through, the bags are taken down, carefully squeezed, to expel all superfluous liquid; and after a short exposure to the air, packed in casks. The finest quality of caviare made is that prepared from sterlet roe; but this is said not to find its way into commerce, being reserved mainly for the Czar's table. It has been stated that three and a-half million pounds of caviare are annually packed at Astrakhan alone.

Every known method of fish-capture is probably pursued in Russia, from the spear to the hook, and from the net to the trap; but as the Russian fishes for commerce, and not for sport, the sanity of a man who prefers a 'fly' to a dragging net would be strongly questioned. In other words, 'legitimate sport' is a consideration which never enters a Russian's head. The fishery is the best harvest, and the best man is he who boasts the biggest take. The fishing-season is a time of joy, for then each man knows he is laying in a stock for the winter, or is earning his best wages. At the fishing-season, therefore, the villages are full of life and merriment. Bonfires are lighted on the shore, to prepare food for the fishermen, and carts are held in readiness to take the monsters off at once to the cleaning-houses, where men

and women are busily engaged in the various processes.

Night expeditions are preferred by the villagers. Beyond the prow of the boat hangs an iron cage, in which burns a fire of pine-logs. The fish come in shoals towards the light, and a man standing in the boat harpoons them with a spear of three prongs. Now and again, down goes the spear; and when it is drawn in, a finny monster is wriggling on its prongs. This is drawn into the boat by means of hooks, and the men immediately row to the shore with their prize. It is a weird sight to see the immense expanse of water dotted with these moving fires, and surrounded by the stationary fires of the encampment, with the dark pine forests for a background; it is weird to hear the shouts from boat to boat, and the loud merriment of those on shore.

The capitalists who fish for a season go to work more systematically. They first of all construct an *utsching* or 'fish-dam.' Stout poles long enough to project a foot out of the water are driven into the bed of the river until they reach right across. A strong rail joins the tops of these posts; and to this are fastened constructions of basket-work which do not touch the bottom. On this arrangement, against the stream, are placed a number of chambers or compartments of basket-work with a swing flap or door. When the fish comes against the flap, it opens, admits the fish into the compartment, and then closes. Occasionally, such a chamber is lowered into the water by itself by means of a number of ropes. In these compartments are arranged several strings, attached to floats in such a way that by watching the floats it is easy to see when a capture is made. In winter, one of these compartments is let down through a hole in the ice, and a hut is erected close by for the watchers. Sometimes, especially in winter, the tell-tales, instead of being attached to floats, are fastened to bells, so that the attendants may remain on shore by their fire until they hear the fish ringing his death-knell.

Occasionally, a cable is sunk into the water; to this are attached a certain number of night-lines baited with a kind of fish known as an obla. Whenever the compartments or night-lines are examined, a man stands ready with a strong gaff, which he plunges smartly into the gills of the fish as soon as it appears on the surface. A rope is immediately fixed to the gaff, and the boat makes for the shore, where the fish is more readily despatched. The cleansers commence operations by beheading their fish; they then open it and carefully remove the roe, which is placed by itself in a tub, and sent off to the caviare-works. The sounds are next taken out and hung up on a long line to dry in the sun. The inner fat is now scraped out, and sent away, to be clarified and made into a kind of fish-butter. The flesh is last of all cut up into convenient slices, and salted or smoked as the case may be, or preserved in ice, to be sent all over Russia as fresh fish.

Some years back, the entrails and refuse were thrown away, and were at once seized by cormorants, which came in great numbers; but in the best regulated fish-villages, the modern economic chemist has set to work to convert all this refuse into isinglass, glue, or manure. He acknowledges nothing as 'waste,' and has

not only banished the word from his vocabulary, but has actually shown that some of the most solid profits of a fishery are realised by 'gathering up the fragments.'

## THE JULLABAD TRAGEDY.

IN FIVE CHAPTERS.

### CHAPTER I.—THE CATASTROPHE.

THERE does not often happen a tragedy of a character to excite and absorb the interest of the Anglo-Indian community, who, as a rule, are obliged to be satisfied with the most they can make out of such social doings as ordinarily take place, in dearth of other matter. But the terrible occurrence at Jullabad in the 'cold season' before last, created a sensation profound enough to monopolise everybody's interest for nearly a year afterwards—to the manifest advantage, it may be remarked, of those individuals whose social escapades during that period of absorption would otherwise have received the warm observation to which they were entitled. But nobody—not even Mrs Colonel Speedy, the dread and respected 'leader' and lawgiver of Jullabad society, without whose revision and sanction no scandal was permitted to go forth into legitimate currency—had any mind to spare, during the continuance of the Jullabad sensation, to go into minor matters.

It was with amazement loudly expressed, and with a deeper feeling of pity seldom expressed at all, that the station heard of Colonel Humby's marriage. Colonel Humby was Deputy-Commissioner of the district of Jullabad. This was his second marriage, and his former wife was not a year dead. The man was nearer to fifty years of age than to forty; and hard drinking and the unrestrained indulgence of violent passions had left their dire stamp upon features which nature had made none too attractive. How any woman of Caucasian race could have so shut her eyes as to give herself to such a man, was in itself amazing; but the amazement became astounding when it was credibly reported that Colonel Humby's second wife was young and charming, well-bred and rich.

The feminine portion of Jullabad were pale with womanly indignation. The unmarried men developed a kind of madness—even the married men caught it; for it was only human nature in revolt against an outrage. There was drinking at the messes and Assembly Rooms such as no one remembered before, and play seemed literally reckless. Everybody knew Colonel Humby; and it was monstrous that he should have got a wife so young and so charming, so well-bred and so rich, as this second bride was reported to be.

But although the indignation of Jullabad was both loud and deep, the 'pity of it' was that which was deeper still and about which no tongue spoke. The late Mrs Humby was not a beautiful woman or a social figure of any degree; people saw very little of her; but they knew she had clung to her husband with an ill-requited fidelity which had helped him upward in life, and more than once saved him from death itself—that she had lived a slave, and had died from brutality, as her reward. Everybody knew this, and that Colonel

Humby was a murderer whom the law had no power to touch. As soon as he buried his wife, he started off to Europe on a year's furlough; and now he was bringing back, inside of nine months, this second wife—the only child and heiress of a millionaire! As has been said, wrath and indignation against the man were loud on every tongue; for the ill-starred bride there was deep pity. Jullabad knew nothing concerning the second Mrs Humby except that she was American by birth, not English—until an officer in the Southwold Fusiliers, who had once met her, supplied a few further particulars. Her father had made a fortune in the West Indian trade. Lieutenant Everest had made their acquaintance a couple of years ago at Mentone, where they were staying on account of the old gentleman's health. All the charms of youth and beauty, and innocence and amiability, were embodied in the American maiden. Interrogated to account for her accepting Colonel Humby for a husband, Lieutenant Everest was dumb—it was unaccountable; and the contemplation of the fact made him, who had seen her, look like a man who had been ravished of his own bride on the very steps of the altar.

Colonel Humby and his bride were in its midst before Jullabad became aware of the fact. No preparation of any kind had been made at the colonel's bungalow, the colonel himself, presumably, regarding such preparations as unnecessary; so that the second Mrs Humby found the place exactly as the first Mrs Humby had left it—even to the details of the latter's slippers and dresses, which still occupied their accustomed places. The first time Colonel Humby was seen after his return his face flamed with brandy, as of old; but none anticipated otherwise. Of Mrs Humby, Jullabad could not get a single glimpse. The colonel never went to church, and very likely refused to allow her to go; at all events, when two Sundays had passed and Mrs Humby did not appear, Mrs Colonel Speedy, sitting in council over a five o'clock tea in her veranda, decreed that she herself and four other ladies of lesser degree should 'call on' the poor bride in due order of precedence, and bring all the social battery of the station to her relief. So, one after another, they called, and were received timidly and gratefully by the young wife. But their calls were not returned. Sometimes in the early morning Mrs Humby was passed on her pony in the partially reclaimed tract of jungle which was dignified with the name of 'The Park'; sometimes she was seen sitting alone in the veranda reading or sewing, or wandering about the garden in the late evening; but she was as isolated from all intercourse with human beings—except her native servants—as if her husband's bungalow were a zenana.

In this matter, Colonel Humby was too strong for Jullabad. He cared nothing for society in the station, which, indeed, he had long ago provoked and defied to his utmost, so that he could add little more to his unpopularity now; and he was his wife's lord and master. For what people said he did not care; he required his wife to obey his will, and to hold no communication with others save with his permission and in his presence; and as, under the condition of Colonel Humby's presence, no one desired any communi-

cation with Mrs Humby, the result was her complete isolation.

It was in February Colonel Humby brought his wife to Jullabad; and by the time that people began to prepare for the annual migration to the hills—in the early days of April—the circumstances of Mrs Humby had grown to be accepted as an established fact about which it was useless to talk any longer. In the stir of moving to the hills she was for a time forgotten. Etheria, the hill station which pertained to Jullabad, only fifty miles off, was a very delightful place and famous for its 'pace,' so that for a couple of months pleasure reigned paramount in that bracing and wicked altitude. About this time, however, men who had been left behind on the hot plains for duty began to turn up, exhausted, for their six weeks' leave, and these brought strange rumours with them. Colonel Humby was keeping his young wife on the plains for the hot season! This was inhuman enough; but other stories floated about on the air—stories spoken in whispers. The man was drinking heavily and using the poor child with cruelty.

Among the officers who were obliged to remain in Jullabad for the necessary discharge of military duties was Lieutenant Everest of the Fusiliers, already mentioned. Three other officers of his corps remained, and from the veranda of their mess-bungalow there was a view of the 'compound' belonging to the bungalow of Colonel Humby. Being imprisoned within-doors for ten or twelve hours of the blazing day, they sat smoking and talking in their veranda—or some distance out in the open—up to one or two o'clock in the morning. One night in July—a still, stifling night, the atmosphere like that of a heated oven, though it was half an hour past midnight—the four men lay back in rocking-chairs in the open compound, languidly smoking, and for the most part silent through sheer want of breath to carry on conversation. All else was silent, too, save for the occasional hungry yelp of a pack of jackals prowling for offal in the vicinity of the bungalows, or the more distant cachinnating bark of the 'laughing'-hyena in the jungles. Even these wonted sounds were intermittent and faint under the atmospheric oppression. The stillness was suddenly broken upon in a manner to rouse into instant activity the enfeebled vitality of the four officers and quicken their interest to a degree of excitement. Cries of alarm broke on the air from the direction of Colonel Humby's bungalow. These were followed, in a minute or two, by the native servants flying in all directions from the compound.

'Humby is in a fit,' observed one of the officers. 'I suppose he is thrashing the natives.'

He had hardly spoken when a short, sharp, scream pierced the air, and the four men leaped to their feet.

'He is killing his wife!' cried one.

There was a minute's silence—painful and anxious silence to these chivalrous men, thinking of the unprotected girl subjected to the brutality of a madman in that isolated bungalow. Then a white figure appeared in the veranda; she stood for a moment in an attitude of fear and indecision, and turning her head quickly towards the door by which she had emerged, sprang from the veranda and ran down the garden

among the shrubs. The four officers were in a distressing situation. The most chivalrous are bound, under the usages of civilisation, to hesitate before interfering between man and wife. There was further reason for hesitating here. The man might be menacing her life, but they could not say so; he might be simply treating her with that brutality in which the law passively licenses the unresisted tyrant. But for men in their position to thrust themselves, from whatever motive, into the domestic concerns of an official holding the high civil rank of Colonel Humby was an act of temerity at which they had good reason to hesitate. Officialism is the governing power in India, and a certain status in the 'service' carries with it (if need be) practical exemption from the operations of the law.

'There he is!' was the exclamation, as Colonel Humby was seen reeling into the veranda. He appeared to be searching for his wife. Not finding her, he stepped off the veranda and went slowly down through the garden.

'He will find her—she is in white. Are we men to stand here?' exclaimed one of the officers.

'Not I, for one!' answered Lieutenant Everest with set teeth. 'If the man were the Governor-General, he shall not ill-use his wife again while I can protect her.' He darted down the compound as he spoke, followed by the others, and took a direction which led towards that part of the garden whither Mrs Humby had disappeared. Her husband was still floundering about among the bushes some distance up. Everest had placed his foot upon the low earth-fence to step into the garden, when he saw her crouching in a heap beneath an orange-tree. The young officer remained where he was, ready to leap across. Colonel Humby called his wife's name; and the poor thing crouched closer to the ground with her hands clasped above her head, as if to offer what frail protection they could against a coming blow. Everest's blood boiled and his fingers twitched savagely. Regardless of consequences, there was a brute's punishment awaiting the Deputy-Commissioner as soon as he discovered his wife's hiding-place. The intoxicated beast was so long in coming! Every detour to right or left among the shrubs made Everest's teeth snap with impatience.

Before the wished-for moment of dire chastisement, however, a shriek of agonised terror from Mrs Humby brought the officer with a leap to the spot. He staggered with horror when he discovered the cause. A cobra was wriggling up the tree at the foot of which the unfortunate girl had been crouching. The deadly reptile paused a moment in its ascent, and with glittering eyes and angrily extended 'hood,' hissed its defiance. Everest had nothing in his hand; and, oblivious to danger, clenched his fist, and dealt the dreaded snake so terrific a blow behind the hood that its spine was shattered, and it dropped to the ground, coiling and recoiling in vicious knots, but powerless to do further mischief. Then the officer raised the unconscious woman in his arms and bore her from the spot. The others, on hearing the shriek, had entered the garden too, and met Everest carrying Mrs Humby.

'Run quickly, one of you, for Dr Rainsford—she has been bitten by a cobra!'

'Good heavens!' was the exclamation of all

three together. Then one started at a run for the doctor; whilst another observed, below his breath: 'If that is so, Charlie, the doctor will be little use; she will be dead before he is here. Take her up to the bungalow.'

Halfway up the path, Colonel Humby stood, in flannel trousers and shirt. Mr Everest, carrying the girl in his arms, walked first, his two brother-officers following close behind. The Deputy-Commissioner took a position in the middle of the path, evidently determined to allow them to go no farther.

'What does this mean?' demanded Humby.

'Your wife has been bitten by a cobra—let me pass,' answered Everest.

The man seemed staggered for a moment, and looked closely into the white face which lay on Everest's shoulder. Then he drew back a pace and glared at the young officer. 'Put her down!' he commanded, pointing to the ground. 'What brought you there? Put my wife down, I say!'

The young fellow's breath came quick and hard, and for a short space he was unable to speak; then, to the astonishment of his friends, he slowly and gently laid the unconscious form across the path, and having done so, drew himself erect and looked at Colonel Humby. The latter made a motion to approach his wife; but in an instant Everest's foot was across her; and shaking in every fibre from excitement, he put out his clenched hand and stopped the man. 'Colonel Humby!' he shouted, 'I will give you ten seconds to obey. Get out of my way, or!'

Colonel Humby was sober enough to see his danger. With a low growl like that of a baffled beast, he turned his back and walked off. Everest drew a deep breath, and tenderly lifted Mrs Humby in his arms. They laid her on a couch in the veranda, administering stimulants as well as they could, until Dr Rainsford arrived, which was in less than ten minutes.

'A cobra, did you say?' inquired the doctor, proceeding to examine hands and feet for the puncture of the poisoned fang.

'I saw it wriggling up the tree under which she was sitting—I killed it,' was the answer.

'In that case, I fear I can do nothing. Poor child!'

The doctor failed to discover the mark of the snake's bite. He poured some brandy down her throat, and sat regarding her attentively with his hands clasped under his chin. A faint fluttering of her bosom and a movement of the eyelids aroused his interest, and he leaned over her and laid his hand on her left side. 'She has not been bitten! The poor thing has only been frightened almost to death. Stand back—or, wait; let us carry this couch out into the open.'

It turned out as the doctor said. In a few minutes, Mrs Humby opened her eyes, closed them again with a shudder, and began to breathe quickly. She had discovered the snake moving among the folds of her dress, and, with that cry of horror which they had heard, had fainted.

Colonel Humby now appeared upon the scene, and heard of his wife's escape with an appearance of shocking indifference.

Dr Rainsford remained a minute or two after the officers left, to have a word with the Deputy-Commissioner. 'Colonel Humby,' he said, 'it is not for others to interfere in any man's private

affairs. I know you are indifferent as to public opinion; but let me warn you of this fact, sir, as a medical man. If you keep your wife on the plains for the remainder of this hot season, you will furnish another grave in the station cemetery before Christmas—in which case, colonel, you may accept my assurance that a stronger power than public opinion will call you to account.'

A fortnight afterwards, the few men in Jullabad made the discovery that Colonel and Mrs Humby were gone to the hills—had, in fact, been some days gone. They did not appear at Etheria; and indeed it was not until their return—in the middle of October—that people knew where they had been.

Matters seemed to go on as usual. Mrs Humby was never met in the mornings upon her pony through the Park, but she was visible in the veranda almost all day long, engaged in needlework. As far as could be judged from such a view as was obtainable thus, she looked better; the atmosphere of the hills had brought back some colour to her cheek. And there was, besides, that sacred and silent expectancy in her bosom which gives brightness to woman's eye in the midst of darkness. Was not the promise of this baby-life, coming to brighten her own, more precious to the ill-used and solitary wife than it ever can be to more fortunate sisters ministered to by the solicitous love of husband and friends?

Then came the time when she was seen no longer in the veranda. Even the masculine heart of Jullabad was touched when it became known that her infant was dead. The mother's lot was darker than before. What went on in that bungalow nobody knew, for no European went there—no Englishwoman even could obtain admittance to the house with a woman's aid and sympathy, when these were sorely needed in the time of agony and grief. The crowning outrage of all was soon made known, and drew a shout of indignation from the community: to attend his wife in her illness, Colonel Humby employed a native doctor!

Public feeling at last became so strong against Colonel Humby's treatment of his unhappy wife, that a statement was drawn up, to be signed by every resident in the station, and forwarded to the Lieutenant-Governor of the province—or if necessary, to the government at Simla itself. As Sir Charles O'Reilly, the Lieutenant-General, was the first official in Jullabad, to him the deputation of ladies came with this paper for the sanction of his signature at the head of the list. The general read the document through, and observed: 'Ladies, I would in this matter willingly sign my name to a stronger representation of the case. As far as I can judge, however, the movement is of a kind to do more harm than good to the poor thing whom we all desire to befriend.'

'How so, Sir Charles?' demanded Mrs Speedy. 'Can anything be possibly worse than her present situation? And we owe something to ourselves!'

'Very true. But what could either the Lieutenant-Governor or the government do? They could only remove the man to another district, which would make things no better. And our interference on her behalf would only deepen still more Colonel Humby's unaccountable cruelty to his wife. You cannot help a woman who is

passively submissive to whatever treatment her husband deals out to her. You may pity her as much as you will; you cannot help her.—We had better let this movement drop," he added, pointing to the paper on the table.

"I'll tell you what I would do, Charles," said the general's lovely wife with flashing eyes, "if I were Mrs Humby; I would roast the man in the ashes of his own bungalow!"

Lady O'Reilly's high-spirited declaration was the only comfort which the deputation carried away with them. Convinced by what the general had said, the movement against Colonel Humby was dropped; but the sentiment of so exalted and respected a lady as the general's wife was too precious not to be widely dwelt upon. In a few hours all Jullabad knew, with deep satisfaction, Lady O'Reilly's declaration that in Mrs Humby's place she would roast her husband in the flames of his own bungalow.

There was many a secret wish that Colonel Humby might indeed goad his unhappy wife to some such desperate act. No one dreamed how nearly the outburst of Lady O'Reilly's indignant heart foreshadowed the tremendous tragedy which appalled the community four-and-twenty hours later.

The following night there was a dance at the Assembly Rooms; and at about eleven o'clock, when the revelry was at its highest, the band—which played outside the building—suddenly stopped. For some seconds the dancers stood on the floor, expecting the music to resume; then an electric thrill of unaccountable excitement swept through the crowd. A gathering and rising of voices without caused a rush to the veranda. There was a dull red glare in the sky; and smoke, flames, and fragments of burning wood were thrown up above the trees beneath it. Every person there knew that it was Colonel Humby's bungalow that was burning—that in fifteen minutes the fire would have eaten it to the ground.

## LOW-TONED FICTION.

MANY of the novels now published may be classed under the above heading, more especially those written by inferior novelists. Women are great offenders in this respect, some honourable exceptions shining out among others like stars in a cloudy sky. Every day sees some new novel issue from the press, and chronicles the plunge of yet another aspirant for literary fame into the crowded arena, to swell the lengthy list of authors.

It is a sign of the times that what are termed 'racy' novels are the most run after by the fiction-reading public, and consequently those most readily accepted by certain publishers. In this money-getting, money-grubbing age, some publishers and authors seem to have met on common ground in pandering to a vitiated public taste, and producing books which will not bear the test of being read aloud in the home-circle. Among the worst offenders in such novel-writing are women, who choose *risqué* subjects to write on, and dwell with a minuteness of detail on topics which the purer-minded of their sisters would hesitate to speak of. There are exceptions,

as we have said—women who do not degrade their talents, but write with a purity of purpose books which it is a pleasure to read and re-read.

Can any one, looking at the question of nineteenth-century light literature from an unprejudiced point of view, say that the style of writing now is an improvement on that which obtained a century ago? The novels of those days were decidedly coarse, their plainness of speech corresponding with the habits and customs of the period; but books were then written with the laudable intention of showing up the vices of which they treated, and, if possible, checking such vices by pungent and scathing satire; thus being in advance of fashionable modern society-novels, which, though more refined in speech, are more destructive to morality, in that the authors gloss over sin, picturing it in alluring colours, wrapping it up in sensuous word-painting, and, while professing to disapprove, yet setting it before youthful imaginations in anything but its hideous reality; or else write in such a matter-of-fact, every-day-occurrence sort of a light of vice as to rob it of its actual criminality.

Both styles are deeply to be regretted, for both are working incalculable harm; and it is sad to reflect on the marked increase of books of this stamp. Rare, indeed, is it to find a novel in which the interest is not centred on the love of a man for a married woman, or of a young girl for a married man. We cannot blind ourselves to what goes on in the world around us, but we do not wish such knowledge thrust at us, so to speak, in fiction. That love is the legitimate theme of romance, one is quite ready to acknowledge, but not love of such a spurious, not to say sinful character. Without being unduly censorious, or wishing to attribute to novelists who so systematically degrade their talents, absolute impurity of motive, it is impossible to do otherwise than lament the immoral tendencies of the age with regard to light literature; authors, publishers, and the public are alike to blame. If such books were not eagerly sought after, they would neither be written nor published, and we should be able to allow new novels to lie on our tables without fear of their contaminating the minds of our growing families. It is no narrow-minded prudishness which causes us to write thus; it is a mere dealing with the acknowledged fact, that our lighter literature is each year becoming less moral, and that the effect of this deterioration in fiction upon the rising generation is already bringing forth evil fruit, and proving, by lowering the wall between vice and virtue, disastrous in the extreme.

It is not necessary to mention the authors who are in this respect the worst offenders; names will readily occur to those who indulge in novel-reading from choice, or are obliged to wade through fiction for reviewing purposes. Of avowed realistic writers, those who follow the French school, little need here be said; they write with a motive; how far they are justified in so doing is an open question. If good is done by such realism, it is weighed down in the balance by evil—the evil of example not being one of the least of the faults to be laid at its door. Some one low down in the scale of literature argues: 'So-and-so writes in such-and-such a style, and

his, or her, books always take ;' and then proceeds to a slavish imitation of the subject handled, without the breadth and power of treatment which raised the other's work out of the ordinary groove. Clever writers will do real abiding good if they refuse to follow the taste of the day for highly sensational matter, and use the talents given them to raise the general tone of fiction; thus setting a good example to the ruck of imitators who think only of the monetary side of the question, and write in a questionable style because it pays them to do so, their excuse being: 'We must live; our profession is literature; and unless we write books bordering on, if not actually overstepping the bounds of morality, they will not be considered "racy" enough to meet the present taste, and so fail to find a market.'

To such may be said: 'Your brain-power is given you to employ for good, not evil; better never touch a pen again, than use that pen in a manner harmful to the world you live in by throwing wider open the gate of pernicious literature.'

A remedy for this growing evil is not easy to find; but if reviewers would steadily set themselves against noticing in any way low-toned and immoral publications, the thin end of the wedge would be inserted. If such novels fell still-born from the press, publishers would no longer care to accept them; and the supply being governed by the demand, they would decrease in number, as writers turned their imaginations into healthier channels. An adverse review often helps much more to sell a book of a doubtful nature than one in its favour, condemnation merely stimulating a certain class to read the novel censured. But if such works were simply ignored, they would not circulate to the extent they now do. At first, it would be difficult to bring this rule into practice; but it could be done if the editors of the best papers and magazines, whose duty it is to raise the tone of English literature, would agree with their reviewers that such publications as can be justly termed objectionable from a moral standpoint should not receive notice of any kind in their columns. Lesser lights would soon follow in the wake of the greater luminaries, and a salutary check would be put on the low-toned modern novel.

It is a social question this of low-toned and harmful writing, touching so closely as it does on the morals of our youth, and one it is high time was taken in hand and grappled with in serious earnestness.

#### A ROGUES' PICTURE-GALLERY.

##### IN TWO PARTS.—PART II.

IN this Picture-gallery may be found portraits of 'confidence' and 'banco' men. The word *banco* was applied to an old English game with dice; and this very game has in America been elaborated into a successful method of swindling. The *banco*-man usually rents an office for a week or two, or at any rate until such time as he can find a goose to pluck; and he has two or three partners or confederates to work with him. One of these, a well-dressed affable gentleman to all appearance, looks out in the principal streets of

the city for a likely dupe. Having found his prey, the affable one rushes up to him, shakes him warmly by the hand with 'How are you, my dear Mr Brown?' The stranger draws back for a moment, and explains that he is not Mr Brown, but that his name is Robinson, of such-and-such a town. The affable one thereupon apologises for his mistake, and retires. But the name of Robinson is whispered to a confederate, and once more the stranger is stopped by a well-dressed man. He is in a strange place, and is flattered by being addressed by name, especially by one who seems to know plenty of people at home that he knows himself, for the *banco*-man has had time to refer to a directory, and has posted himself accordingly. The fly is gradually drawn towards the web; he plays *banco* with his newly-found friend, is allowed to win for a time, but at last draws a blank, and loses a lump sum of money. It is said that a certain lecturer on things æsthetic, while he was in the States coaxing the dollars out of the public with his 'curls, sunflowers, and knee-breeches,' fell a victim to one of these swindlers, and left a large proportion of his gains as a tax on his simplicity. These men seem to be fascinated with their calling, for one of them is reported as having expressed himself as follows: 'The prettiest *banco* is when we land a big fish. Talk about trout-fishing! Just think of the fun hooking a man that's worth from five hundred to five thousand dollars! Of course, it takes a man of education and refinement to do this sort of business, but there are several college graduates among our fellows.'

The well-known dictum, 'The receiver is worse than the thief,' is strictly true, for unless the thief can find a safe market for his ill-gotten property, his occupation is gone. Receivers in large cities generally follow some legitimate business, under cloak of which they can carry on their nefarious trade. They are cautious men, who seldom get punished, partly because of the great care which they exercise in dealing with their clients, and also because of the state of the American law, which renders it extremely difficult to bring home to a man legal proof of his guilt. The receiver never deals directly with a thief, but always through a third person, generally the wife of some convict who is serving his time in prison. He gives the thief about one-fourth of the value of the articles which he purchases, and should they consist of plate or jewelry, the gold and silver are put into the melting-pot before he attempts to turn them into money. The petty thieves, pick-pockets, and shop-lifters, are his usual customers; and if he is cautious, he will drive a profitable trade with very little risk to himself.

'Sawdust-men' are a class of swindlers that live on the principle of 'diamond cut diamond,' and we confess that we have no sympathy for their numerous victims, for the latter are quite as criminal as themselves. Their *modus operandi* is the following. They first of all obtain the names of persons who are regular subscribers to lotteries, and soon compile a list of those who 'make haste to be rich.' They now issue a confidential circular, which states in guarded language that they have for sale counterfeit notes of various denominations, which they are willing to dispose of for about ten per cent. of the nominal value. A meeting is arranged at an office, and the would-be buyer

goes to make the purchase. He is shown quantities of real notes, fresh and crisp from the government treasury, while their handler pretends that they are only splendid imitation ones. An assorted number of them are chosen, tied into a bundle, and thrown carelessly to the top of the desk at which the seller sits, which desk stands against the wall. He then opens the desk for the ostensible object of showing his client something else, the upraised lid hiding for a moment the bundle of notes. While this is proceeding, a confederate in the next room opens a panel in the wall, and exchanges the bundle for a similar one stuffed with sawdust. The stranger pays his money, and walks off with the valuable parcel. When he subsequently finds that he has been cheated, he dare not seek the aid of the police, for of course his mouth is closed. This method of making the victim a participator in the crime is very clever, for it insures secrecy, and the sawdust-man continues to flourish. It is true that the panel trick has been worn somewhat threadbare; but several other dodges quite as effectual are adopted to change the notes for rubbish.

The horse is often truly described as a 'noble animal,' but, by some strange fatality, it has given rise to more ignoble transactions than any other quadruped. The frauds that are practised at horse-sales are without number, and seem almost to justify the saying of an experienced dealer, 'Trust neither your brother nor your pastor if he is trying to sell you a horse.' Let us trace one transaction of the kind. The prelude consists of an advertisement in one of the newspapers to the effect that a gentleman who is suddenly called abroad wishes to find a kind master for his beautiful brown horse, so many hands high, a fast trotter, and perfectly sound. Can be seen at his private stables. The would-be purchaser finds a commodious stable, the horse in apparent good condition, and commences negotiations with the glib-tongued man in charge. Presently a confederate rushes in and displays a great anxiety to purchase the animal. The man refuses to sell to him, on the ground that the newcomer is a mere dealer, who will sell the horse again, whereas the real object is to find a purchaser who will guarantee the favourite a good home. He would not sell to a dealer for thrice the money which he is asking for the animal. This seems conclusive; but the confederate presently whispers to the first buyer that he is determined to have the horse; and if he, the first comer, will buy it for him, he will give him a commission of fifty dollars on the transaction. This temptation to make a ten-pound note so very easily is too much for Mr Verdant Green. He buys the horse, and leads him to a place agreed upon by the confederate. But the man is not there, and the purchaser has to keep his very sorry bargain for himself. A case is cited in this book of rogues where a purchaser drove away a horse so purchased, when it dropped down dead before he had covered many yards. The police keep a sharp lookout for these 'horse-sharps,' who are, however, so careful to keep just within the law that a conviction seldom follows an arrest.

One more method of cheating, which is perhaps peculiar to the New World, is practised in the following artful manner. The performer is known as a 'gold-brick swindler,' and he is generally a

man of education and pleasing manners. With a forged letter of introduction, he calls upon a well-to-do citizen, and for the first few weeks of their acquaintance his behaviour is all that can be desired. He then tells a plausible story to the effect that some years back he was instrumental in saving the life of a notorious burglar. The burglar, for an extensive gold robbery, had since been sentenced to several years' imprisonment, but was now at large. Anxious to do the man who had saved his life in years gone by a good turn, the burglar had confided to him the fact that the produce of the gold robbery, buried during his incarceration, was now, in the shape of ingots, again in his hands. The difficulty of disposing of these was somewhat great, and for this reason he would sell them for about half their value to his old friend, who, not being a convict, could easily realise them. The well-to-do citizen is invited to purchase some of the ingots, with the understanding that they are first to be submitted to assay, to test the quality of the metal. An appointment is made with the ex-convict, and an ingot is produced. A piece is broken off each end of the bar, and a file is used to remove some gold-dust from its centre. These morsels of metal are given to the purchasers, and by them sent to an assay office; and from that office an assay note is duly received to the effect that the gold is of fine quality. A sale of the brick or bricks naturally follows; and the purchaser, who, by the way, is no better than any other receiver of stolen goods, is very well pleased for a time with his bargain. The brick is ultimately found to consist of manufactured metal with real gold ends, and a wedge of gold in the centre where it has been filed.

Want of space will not permit us to describe more of the ingenious dodges which have been and are practised in order to defraud the unwary or to tempt those who are passing honest. But the examples cited may serve to put those on their guard who are by their position likely to become a prey to evil-doers. We shall perhaps serve a better purpose by making a few remarks upon the general appearance of these men who live by crimes against property, as indicated by their photographs.

If we begin our review by a notice of the pictures of burglars, the reader will at once be prepared to believe that the Bill Sikes type of countenance is predominant. But, alas for the falsity of preconceived notions, the reader will be quite wrong. No trace of Bill Sikes is here. His portrait, as drawn by the many capable artists who have illustrated the various editions of Dickens's works, is familiar to all of us. He is a beetle-browed ruffian, with a coarse mouth and a flat nose, having, in a word, as close a resemblance to an ugly bulldog as it is possible for the human features to imitate. But the real living burglar as he is photographed here has not the remotest resemblance to that ideal, but looks like any ordinary respectable member of society. We turn to one portrait at hazard. It is numbered twenty-one, and the name below it is 'John Clare,' alias Gilmore, and he is a bank burglar. The picture is that of a good-looking man of about thirty. He wears a moustache and whiskers, and his dress is that of one who is evidently particular about his personal appearance. If we saw this portrait in a friend's album, we should probably ask to whom

this honest good-tempered face belonged. We will now turn to Mr John Clare's memoir, and ascertain why he appears in such doubtful company. Here we find first his 'Description—Thirty-six years old in 1886. Born in United States. Photographer by trade. Single. Height, five feet seven and a half inches. Weight, one hundred and fifty pounds. Black hair, dark hazel eyes, dark complexion. Wears black side whiskers and moustache. Has a slight scar on left arm near elbow.' His 'record' is too long to quote at length, but we will give the gist of it.

Clare is a clever and desperate bank burglar, and is credited with the ability to make a good set of burglar's tools. In 1866 he was tried for murder, found guilty, and sentenced to be hanged. The Court of Appeals granted him a new trial, and he was subsequently acquitted. In 1874 an attempt was made to rob the safe of the New York County Bank, and Clare, under the name of Gilmore, was the promoter of the enterprise. He hired a basement next door to the bank, and after removing, with his accomplices, the brick walls of both buildings, set a steam-engine to work to bore out the back of the safe. The police having obtained information of what was going on, made a raid and captured three of the men engaged, but Clare escaped. He was caught, however, nearly two years afterwards, and sentenced to four and a half years' imprisonment. Moral, 'Do not judge by appearances,' for our good-looking, good-tempered friend turns out to be not only a desperate burglar, but a murderer.

Let us take another case. We turn over the leaves of the volume, and are at once attracted by the portrait of number fifty-eight, for he is distinguished from his fellows by appearing in military uniform. He is quite a young man, and his name is Hugh L. Courtenay; but he prefers being known as Lord Courtenay, and has figured in the best American society as a British nobleman. We learn that he is well known all over the States and in Canada, and that there are many with whom he has made acquaintance, who would be glad to see him again, if only for the opportunity of giving him up to the police. His method of procedure is simple and effective, and the 'handle' to his name gives him a great initiatory advantage over other thieves, for the general public, even in democratic America, have a great affection for a lord. A man likes to have the opportunity of saying, 'My friend, Lord So-and-so, &c.,' and actually feels flattered when his friend, Lord So-and-so, having run short of cash, asks him to honour his cheque for a large amount. In this simple manner, the bogus British lord under discussion succeeded in duping many victims. He was at once received in the best society, and by his distinguished appearance and manners completely captivated the female portion of the community. He spent money on cheap trash, which he generously presented to his friends. A young Baltimore belle describes him as a most fascinating personage, and says that he was the first who ever 'fired her soul with love.' The scamp was in fact lionised; but as he was always 'wondering what could be the matter with his stupid bankers in London,' his male friends became suspicious. The ladies were then laid under contribution by his lordship, and many of them were victimised by him. At last the long

impending crisis came, and 'Lord' Courtenay suddenly disappeared.

Taking a general survey of the portraits, we can only describe them as being a fair sample of an ordinary crowd, except that the broad forehead in numerous cases indicates brain-power of no mean order; more especially is this the case among the forgers and counterfeiters, and it is only fair to presume that their training as engravers, chemists, &c., has led to higher intellectual development than can be found among the general public. But let it not be supposed from our remarks that all these portraits are of nice-looking people, for this is, of course, not the case. Some of the men have the word scamp as clearly traced upon their faces as if the letters were branded on their brows; but it cannot truly be said that these shady-looking ones are in greater proportion than they are in any ordinary crowd.

This last remark can hardly be applied to the female portraits, of which there are only nine, for, truth to tell, there is not one of the number that we should care to regard as an acquaintance. Perhaps the chief reason for this apparent libel on the other sex is the disadvantage under which the women labour in not being able to conceal their mouths. Of all features of the countenance, the mouth is most expressive of our inmost thoughts, and many a man is indebted to a thick moustache for shielding him from uncomplimentary criticism. The women whose portraits are before us confine their attention to pocket-picking and shop-lifting, and their doings do not call for further remark.

We close the volume with very mixed feelings, and with the suspicion that either we ourselves must be unusually blind, or that the art of physiognomy—an innate knowledge of which is such a frequent boast by people who desire to be thought observant—is a delusion and a snare. Was Lavater a humbug? or could he, if living now, trace the markings of crime in some of these placid open countenances? Our ideal portraits of criminals have vanished for ever.

It is very difficult, in attempting to draw a moral from these criminal records, to avoid giving expression to the hackneyed phrase to the effect that, if these men had applied their talents to honourable pursuits, and had exercised the same amount of industry and ingenuity in conducting them which they have devoted to crime, they might have won high places in the world's esteem. Such an exordium from the lips of the judge is a common preface to a sentence of penal servitude, and is probably regarded by hardened criminals as a necessary part of the proceedings. Judging from the histories of these wretched men, whose portraits form so strange a Picture-gallery, such remarks are quite unheeded by them. They behave as if there were only one mode of getting a living, that of circumventing their fellow-creatures. One of these criminals in our own country wrote in his diary, little thinking that the words would eventually be read in a court of justice, 'Some men has *branes* and no money, and some has money and no *branes*.' He wrote further to the effect that it was the mission of the impecunious to rob the empty-headed ones. This was his code of morality, which he proceeded to act upon until pulled up by a sentence of penal servitude. He was the type of many who mistake the low

cunning with which they are gifted for genius. As our records prove, some of these criminals possess great powers of observation, and by this means they have gained a wonderful knowledge of human nature. But they are so constituted that they cannot see any *good* in their fellow-beings. At times of failure or detection, they are apt to reflect that perhaps after all 'honesty is the best policy.' But the thought that any one can be honest as a matter of right principle is beyond them.

In years gone by, lunatics were treated far worse than criminals are in the present day. We now care for them tenderly as afflicted ones who have the strongest claim upon our sympathy. We are just beginning to regard chronic drunkenness as a disease, and find that under scientific treatment the malady can be conquered. Perhaps, as the world grows older, we may find that there is some abnormal condition of the brain which causes a man to seek crooked ways rather than earn an honest living. Such a possibility is foreshadowed to a certain extent by that sad but frequent addendum to a verdict—'Temporary insanity.'

#### SOMETHING ABOUT BETHLEHEM HOSPITAL.

EVERY one approaching London from the south or Surrey side of the Thames, through St George's Road, must have observed on his left a building of vast proportions, crowned by a fine dome springing from the centre, and standing in a large enclosed space, neatly laid out. This is the celebrated lunatic asylum commonly called 'Bedlam;' and a few words on its singular origin may not be unacceptable, as the circumstances are not generally known.

In the year 1247, a priory of canons, with brethren and sisters, was founded near the north end of Old Broad Street, in the city of London, by one Symon Fitz-Mary, who was sheriff for that year, and endowed it with all his lands in the parish of St Botolph, Bishopsgate. About the year 1340 this priory was taken under the special favour of the king, Edward III., who, as Stow quaintly describes it, 'graunted protection to the brethren "Milicie Beate Marie de Bethleme" within the cite of London, in the 14th year of his reign. It was then an hospital for distracted people. In this place, people that be distraight in wits are by the suite of their friendes receyved and kept as afore it was used, but not without charges to their bringers-in.'

Thus the priory of St Mary of Bethlehem became a regular hospital, chiefly devoted to the insane, and was recognised as such; and about the year 1450 it passed under the formal protection of the city of London authorities. But about a century later (1556), the corporation bought the patronage, property, and buildings with a sum of money bequeathed for that purpose by a certain charitable citizen and merchant tailor, Stephen Gennings by name. The canons of this priory were distinguished by the Star of Bethlehem embroidered on their gowns; and by their rules, they were bound to supply food and lodging to the 'Bishop of Bethlehem,' should he ever happen

to visit London. This bishop, it would appear, was connected with the brethren and monastery of St Theodosius, founded at Bethlehem, in Judea, about the year 520 A.D.; and to this convent were annexed three separate hospitals—one for the aged, one for the sick, and one for the insane. Whether this last-mentioned fact had any influence on the London establishment is not known, but it is certain that this house was recognised and used as an establishment, or asylum, for lunatics in the beginning of the fifteenth century; and the reason given for this—if Stow's statement is to be relied on—was, that 'the king of England not likinge such kind of people to remaine so near his palace,' had given orders for the immediate removal 'of certain lunatics from Charing Cross to Bethlehem in the Bishopsgate-without.' Charing Cross is here understood to mean the original lunatic hospital of London, which then stood in the parish of St Martin-in-the-Fields, and consequently close to Charing Cross. The site of this building continued to belong to the trustees of Bethlehem Hospital till the year 1830, when it was sold to, or exchanged with, the Crown, and was utilised in widening and improving what is now called West Strand, and the open space round Charing Cross.

Matters continued thus, the priory of St Mary of Bethlehem—or at anyrate a portion of it—being the recognised hospital for lunatics until the dissolution of the monasteries, when the priory being suppressed, the city, with the king's approval and confirmation, purchased the asylum which became the 'Bethlehem Hospital,' by which name it has been known ever since, all mention of its former religious title of the 'priory of St Mary of Bethlehem' being suppressed; and subsequently, the old priory church and private chapel were ordered to be removed altogether during the reign of Elizabeth, and the site was probably immediately built over.

In 1569 a benevolent lord mayor, Sir Thomas Roe, another merchant tailor, enclosed an acre of ground, 'part of the hospital land, lying on the west towards the Moor Fields,' to be used as a burial-ground, his own wife being one of the first occupants. This same ground, afterwards laid out as a private garden, was used as such until the year 1866, and still belonged, with other ground adjoining, to the governors of Bethlehem Hospital. In that year, however, it was sold to the Great Eastern Railway Company for sixty-one thousand pounds, and it is on this ground that the present Liverpool Street Station is now built.

It would appear that the name of the hospital seems to have been corrupted into its well-known title of 'Bedlam' about the middle of the sixteenth century, or shortly after that period, for we find in Shakespeare:

Let's follow the old earl, and get the Bedlam  
To lead him where he would; his roguish madnes  
Allows itself to anything.

Matthew Prior, too, uses the term:

One morning very early, one morning in the spring,  
I heard a maid in Bedlam, who mournfully did sing;  
Her chains she rattled on her hands, while sweetly thus  
sang she,  
'I love my love, because I know how truly he loves me.'

The allusion to the rattling of the 'chains on her hands' occasions a painful and uneasy feeling

in regard to the probable treatment of unfortunate lunatics in those days of darkness and barbarity, when brute force and savage violence were thought to be the only proper systems of treatment to be applied to those whose great misfortune it was to possess disordered intellects.

The old priory having at length been found inadequate, a new hospital was erected, not far from the old one, in the year 1675, in the Coleman Street Ward, outside the city wall, on a plot of land of two acres and a half, which the governors held on lease from the corporation of the city of London, at a nominal rent of one shilling per annum, for a term of nine hundred and ninety-nine years. These new hospital buildings were close against the city wall, and were designed by Robert Hooke, the well-known writer on philosophy and science, who had been appointed surveyor to the corporation, and who was intrusted with the surveying and laying out of the ground for the rebuilding of London after the great fire of 1666. He subsequently held the office of Secretary to the Royal Society until his death in 1702. The new hospital, which was five hundred and forty feet long by forty deep, is said to have cost seventeen thousand pounds. It was, however, still found too small for the increasing wants of the population, and two wings were added in 1733, devoted entirely to incurables. The entrance gates of this building bore two statues which were designed by Cibber; they represented, with life-like, painful reality, two different stages of madness. These two statues are, we believe, still preserved in the South Kensington Museum. This hospital has often been referred to by writers of the last century, and is represented by Hogarth in the last picture of his well-known series of pictorial sermons entitled the 'Rake's Progress.'

As time rolled on and population largely increased, so the demands upon the resources of the old establishment in Coleman Street continued to increase also, until it was determined to build another and a larger hospital in a more open and commodious spot, and give up the old city premises altogether. Accordingly, an eligible site of eleven acres, situated in St George's Fields, was acquired in the year 1810, a spot at that period almost 'in the country,' and very fresh and open, part of it having been occupied by the once famous 'Dog and Duck' tea and pleasure gardens, a great resort, at that period, for Londoners who were, like Mrs Gilpin, 'on pleasure bent,' and yet, like that thrifty lady, who 'had a frugal mind;' for here small luxuries in the way of tea, beer, and punch, with a little fiddling and dancing, might readily be obtained at a cheap rate. On this site, the present building was erected, at a cost of one hundred and twenty-two thousand five hundred and seventy-two pounds, or more than seven times the amount of the Coleman Street building. This large amount was made up by grants of public money, and by a large influx of subscriptions, both from private individuals and public bodies and Companies. The hospital was transferred to St George's Fields in 1815. Large additions were made to this building about the year 1838 by Sir R. Smirke, the architect of the General Post-office and the British Museum; and so stands the Pedlam of the present day, one of the largest

lunatic asylums which the country now possesses, and where every appliance and practice that kindness, humanity, and common-sense, founded on long experience and close observation, can dictate are put in requisition in the modern and scientific treatment of those labouring under the saddest and most distressing of mortal afflictions. How different from the old systems, when patients were chained and manacled, or flogged and beaten without mercy; and when the patients—even the worst cases—were exhibited to the thoughtless public, who were admitted to Bedlam at so much per head, and allowed to irritate and make sport and fun of these unfortunate and deeply afflicted creatures. But let us all be thankful that these horrors have become a matter of black history, and may be now considered as things of the past, in these days of superior knowledge and enlightened advancement.

#### THE CITY LIES IN HUSHED REPOSE.

THE city lies in hushed repose,  
The wintry night-wind freshly blows,  
As if to rock the cradled host  
In slumber's sweet oblivion lost.  
But hark! a sound, and lo! a sight  
That wakes the town in dead of night.

A shriek and a glare,  
A cry of despair  
At the flames in their ire,  
For the one word is 'Fire!'  
The people rush out,  
And, with hurry and shout,  
Press on to the light  
As it brightens the night,

And spreads like a banner unfurled up on high,  
A sign and a terror against the dark sky!  
But hark to the clatter, than music more sweet,  
Of the rolling wheels and the horses' feet!  
'Out of the way—out of the way!  
They come to save—now clear the way!'

A sea of faces upward turned,  
One fear by every heart inured;  
By ruddy light is clearly read  
On every brow the anxious dread.  
A mother 'mid the bright light stands,  
Her neck tight clasped by baby hands,  
And through roar and hiss,  
Not quite they miss  
Her piteous frenzied cry;  
But mounting quick on high  
A hero springs,  
His helm a star  
Of hope, that flings  
A halo far  
'Mid the lurid light,  
For a moment lost, then dimly seen  
As it gleams on the sight,  
The curling wreaths of smoke between!  
Up the ladder One rushed, but Three come down,  
And the shining helm is a hero's crown!  
Yet heeds not he what people say,  
He only bids them 'clear the way!'

## CONCERNING BELLS.

As the soft breeze of a summer day will carry the vibrating echoes of a peal of bells into the far distance, to find their answer on mountain heights and in hollowed dell, so their musical voices sometimes recall dead or absent friends, and reminiscences of events of long ago that have been forgotten for years. The same thing seldom affects two people in an equal degree. Extremes often meet, and such sounds as the ringing of bells may at once suggest something ludicrous or extremely solemn, a pleasant incident or a disagreeable experience. Their charm and influence, however, are acknowledged by all save the carping few who vote them a nuisance, or the unhappy sufferer from a too highly strung nervous organisation, who cannot endure noise, even if it is disguised as music. Bells are so intimately linked with the trifling and the momentous, the sad and the joyful events of life, both public and private, that their manifold uses or relative importance in the daily routine is frequently overlooked; and yet they may be classed in the category of those seemingly trivial but essential factors which help to make existence easy and possible, by economising labour, marking periods of time, sending forth warnings and notices, and making known public rejoicings or a nation's mourning. The hammering and the clashing, the chiming and the striking, the ringing and the tolling of bells are accepted as a matter of course, just the same as the meals they herald, or the inevitable recurrence of mid-day and midnight, the sun rising and the sun setting. If the food, the light, and the darkness were suddenly withdrawn, so a perceptible blank would remain in the absence of bells, proclaiming the sorrows and the joys of mankind, and, as the old Italian writer, Magius, so poetically expresses it, 'giving a tongue to time, which would otherwise pass over our heads as silently as the clouds, and lending a warning to its perpetual flight.'

The origin of the bell is not known; but a knowledge of it goes back to a period beyond the

written history of nations. The pious Dionysius Barsalabi, in his Dissertation on Bells, asserts that he finds it recorded in several histories that Noah received a command that the workmen employed in building the Ark should be summoned to their labour by the strokes of wood on a bell; but the earliest mention of them in Scripture is found in Exodus xxviii. 33-35, and xxxix. 25, when speaking of the necessary ornaments for the hem of the high-priest's robe: 'And beneath upon the hem of it thou shalt make pomegranates of blue, and of purple, and of scarlet, round about the hem thereof; and bells of gold between them round about: a golden bell and a pomegranate, a golden bell and a pomegranate, upon the hem of the robe round about. And it shall be upon Aaron to minister: and his sound shall be heard when he goeth in unto the holy place before the Lord, and when he cometh out, that he die not.'—'And they made bells of pure gold, and put the bells between the pomegranates upon the hem of the robe.' It is possible that the Assyrians and Egyptians used bells exclusively in religious rites; but the Greeks and Romans employed them for secular as well as for religious purposes. At the British Museum may be seen, in a case in the Nimroud Gallery of Assyrian Antiquities, eighty small bronze bells with iron tongues, which were found by Layard in a caldron, when excavating Nimroud—the ancient Calah of Scripture—on the banks of the Tigris, the approximate date of which city may be given from B.C. 885 to 630. The great feasts of Osiris, the judge of the dead, were inaugurated by the Egyptian priests with the ringing of hand-bells; and the Greek priests of Cybele followed the same custom when they sacrificed to the 'mother of a hundred gods.' Later, they were in more general use with both Greeks and Romans. Pliny refers to the sounding of a bell in public places in Athens to advertise the sale of fish—doubtless, the predecessor of the modern town-crier, who may still be heard in remote country districts. The Greek sentries in camps and garrisons, when they heard the ringing of a bell,

knew the relief-guards were approaching, and were bound to answer the signal. At Rome also, the musical tinkling, announcing the hour for the indulgence of the luxurious bath, was welcomed by the Romans, who made great use of bells as personal ornaments, and adopted them for emblems on their triumphal processional cars.

The small quadrangular hand-bells, made of thin plates of hammered iron, riveted together at the sides and bronzed—a form represented on some of the old Irish stone crosses, and specimens of which are in the British and Hibernian Museums—were exclusively used for ecclesiastical purposes. Their introduction into Britain is generally assigned to the wandering monks, who in those early days of Christianity made frequent pilgrimages to Italy. Ireland possesses a rich collection of these old bells, some of which, with a traditional history, are preserved in costly shrines, embellished with gems. In the *Annals of the Four Masters*, mention is made of the 'Bell of St Patrick,' which has ever been held in special veneration because of the belief that it was the property of that saint. For generations this relic was in the possession of the Mulholland family, who kept it buried, in order to insure its safety during the disturbances which so frequently troubled their country. The last descendant of the family bequeathed the treasure and the secret of its hiding-place to the late Adam McClean, who, on searching, duly found in the spot indicated a strong oaken box, containing the old bell, enclosed in its lovely shrine, and with it a Bible written in early Irish characters. This bell is only six inches high, five broad, and four deep; the shrine is of beaten brass, covered with an antique design of gold and silver filigree, worked in complicated convolutions and knots. The whole is profusely studded over with rock crystals, garnets, and other precious stones. It is now in the Royal Irish Academy, an interesting collection, that includes the almost unique 'bell of Armagh,' besides others, rivals in age and beauty. But as a priceless specimen of the skill and workmanship of those early days, none of the caskets in which each bell is placed equals that of St Patrick. Supplementary to these small bells, used in the services of the Church, are others employed for the administration of oaths, which oaths were considered essentially binding and sacred. Apart from the veneration felt for these bells, superstition sometimes invested them with peculiar powers, like the 'bell of St Columba,' for example, known as 'Dia Diagheltus' (God's vengeance), which the taker of the oath believed could inflict on a perjurer a terrible and indescribable punishment. Dr Beresford, the late Archbishop of Armagh, had four very curious old bells of this class. The venerable prelate purchased them at different times, and in different parts of Ireland, from peasants, whose reverence for their sanctity had declined in these days of progress, and who, fortunately, were not unwilling to part with things to them comparatively worthless, but above all price to a collector.

The suspended bell is a recent introduction, compared with the antiquity of the hand-bell, used in heathen as in Christian times in the celebration of religious rites. The development

of the heavy swinging bell, from the time of the Anglo-Saxons to that of the Normans, must have been tolerably rapid, when the great size and strength of the belfries, built by the latter, is considered. About the middle of the seventh century, in the reign of Egfrid, Benedict, Abbot of Wearmouth and of Jarrow-upon-Tyne, presented some large bells to his church; and about the same period the Venerable Bede relates how the nuns of St Hilda, at Whitby, were summoned to prayers by the sound of bells. At the present day, very few bells are left bearing authentic dates previous to the Reformation, although it is said that one was removed from the belfry of an old church in Cornwall, inscribed 'Alfredus Rex,' which must, if the inscription was correct, have been in use for a thousand years. The most reliable guide for deciding the approximate date of the casting of a bell is the several marks and stamps impressed upon it by the founder, for it is generally known in what century any noted founder lived; and they were also fond of inscribing on them quaint mottoes, sometimes of exhortation, sometimes of warning, a definition of their use, or an injunction to attend to certain duties. In 1673, an old peal of bells, each bearing a motto, was taken down from the belfry of St Michael at Coventry and recast. No. 4 was the workmen's bell: 'I ring at six to let men know, When to and from their work to go.' No. 7, the sermon bell, running thus: 'I ring to Sermon with a Lusty Bombe, That all may come and none may stay at home.' No. 8 implies the frequent occurrence of fires, when the greater part of the houses were built of wood instead of stone: 'I am, and have been called the Common Bell, To ring when Fier breaks out to tell.' An old bell at St Sidwell's, Exeter, is, like many small things in this world, both assertful and boastful: 'I mean to make it understood That though I'm little, yet I'm good.' Another, hanging in Newton-Abbot Church, has a similar inscription: 'Although I am both light and small, I will be heard above you all.' Devonshire has its full share of fine medieval churches scattered about the beautiful rich county, and these churches, as a rule, have heavy peals of ancient bells. The peal in Exeter Cathedral, ten in number, claims to be the heaviest as well as the sweetest in all England.

Among the melodious bells of Dewsbury, in Yorkshire, is one called 'Black Tom of Sothill,' which was presented in expiation of a murder. Its lugubrious sound booms out and breaks upon the midnight silence of a Christmas eve, when its solemn tolling is known as the 'devil's knell,' signifying, that when Christ was born, the devil died. Legendary superstition has always invested bells with miraculous powers and strange influences; but why the so-called spirits of darkness are credited with a strong aversion to their din, has never been satisfactorily explained. In many Catholic countries, the church bells are set ringing during a thunderstorm, a superstitious practice which prevailed in England before the Reformation, for Latimer alludes to it, saying 'that the devil might take flight, and so the storm subside.' Wynkyn de Worde also believed in its efficacy, 'because,' he writes, 'evil spirits no doubt moche when they hear the bells ringen.' A remnant of the same faith lingers in the tolling

of the 'Sanctus' or passing-bell, which, previous to the eighteenth century, was sounded before, not after, the mortal had joined the great majority; and the Italian will account for the deafening uproar of bursting bombs in the piazza in front of the church, and the promiscuous clashing of bells from the campanile, during the celebration of the *festa* of a local saint, by saying that such noise 'pleases the saints, and drives away the devil.' Sailors are especially credulous of the good or evil omens of bells set ringing; and stories of them having been heard above the roar of the ocean, and the whistling of the wind during storms, like the lost bells of Tintagel, or those of the submerged city between the Scilly Isles and the Land's End, are too familiar to bear repetition. Moore founded his plaintive song, *Silent, O Moyle*, on an old Irish myth on the power of church bells. 'The daughter of Lir was by some supernatural power transformed into a swan, and condemned to wander for many hundred years over certain hills and rivers in Ireland till the coming of Christianity, when the first sound of the church bells was to be the signal for her release.' The Netherlands claim the first introduction of chimes; which, by the way, are nowhere sweeter, or more welcome, than in London city on a fine Sunday, when the quiet of the well-nigh deserted streets is emphasised by the contrast of the whirl, the rush, and the full throbbing life of a week-day. The carillons of Ghent, Bruges, and other continental towns are played by means of keys attached by bands to the bells, on the same principle as a piano; but in England—where the art of campanology is brought to a higher perfection than in any other country—the good old fashion of swinging them by pulleys is still universal.

The utility of bells is undeniable. They act as signals, as warnings, time-keepers, and a host of other offices by which labour is saved and punctuality insured; and their usefulness is more than balanced by the annoyance and irritation created by a senseless and unthinking misuse of them. The domestic wire-hung bell—unknown before the reign of Queen Anne—is already nearly obsolete, superseded by the more convenient electric bells and telephones; and grandchildren of the present generation will probably have no associations of pain, fear, pleasure, suspense, or certainty connected with the ringing of the house-bell. Distinct sensations and different significations—real or fancied—are often conveyed by a bell or bells, corresponding to the mood or desires of the hearer. The ring at the door that announces the messenger of painful, unwelcome, or momentous news, once heard, is never forgotten; and a bell rung in the dead of night, when a household is wrapped in sleep, is sufficient sometimes to cause a panic. All sorts of fears are roused and dangers foreshadowed, difficulties imagined and disasters threatened. It is murder, thieves, fire, sickness! All energy for the moment is paralysed and courage effaced, and the hysterical excitement that ensues only subsides when one, braver than the rest, goes to find out the origin of the alarm. The ringing of a railway bell, also, announcing that the train will depart five minutes hence, puts all philosophy to flight, and defies the hearers of its deafening twang to exercise calm indifference or retain

their wonted self-possession. An unreasoning agitation follows, in defiance of previous resolutions not to be flurried, and a positive knowledge of ample time to spare. The slow tolling of the jail-bell before the execution of a criminal is happily of comparatively rare occurrence, and very few ever hear the suggestive doleful sound. The regular striking of bells on board a ship helps to break the monotony of a long voyage, when there is little to mark the passing days and nights. The uncompromising persistency with which the early work-bell of a factory rings is always an unpleasant noise; and equally unwelcome is the school-bell on a bleak winter morning, that rouses youths and maidens out of that deep sleep which falls so easily and naturally on the young, whilst the old and middle-aged may court the goddess in vain. The summons must be obeyed, and the drowsy eyes, that seem to their owners only just to have closed, must be opened to the raw, dark, and uninviting outside world.

---

RICHARD CABLE,  
THE LIGHTSHIPMAN.

CHAPTER XLV.—MISS OTTERBOURNE.

JOSEPHINE's position in Bewdley Manor had gone through a change, a change advantageous in one way, but bringing with it great vexations.

Miss Otterbourne was a small old lady of delicate bones and mind, of small ideas and petty interests. She lived in her great house without a companion, made calls in her grand carriage when the coachman allowed her to use the fat horses, potted in her conservatories about her flowers, and picked them only when suffered to do so by the head-gardener. She kept a great many servants, and was badly served by them. She spent a great deal of money, and had little pleasure out of it. Josephine was shocked to see how the old lady was pillaged by all her attendants. She kept cows, and bought her butter; poultry, and purchased her eggs; had gamekeepers, but ate very little game. Her pheasants cost her about their weight in silver. She grew grapes and apricots and nectarines and peaches, which the gardener sold in Bath, and put the money into his own pocket. Her porcelain was broken, and had to be replaced incessantly, because the china shopkeeper tipped the breakers for every breakage. Every tradesman who attended the house put money into the servants' pockets, on the understanding that they made work for artisans there. Every shopkeeper who dealt with the house gave a percentage to the servants to encourage waste. Coal-wagons were incessantly bringing their loads to the house, which apparently consumed as much as a glass-furnace; but the coal-cellar door was left always open for all the cottagers to supply themselves from it, and a sack was deposited every turn of the wagon at the gardener's, or the gamekeeper's, or at the lodge, or at the coachman's, or at the house of the mother of the boy who cleaned the knives. The gardener was annually carrying off prizes at flower-shows; but the greenhouses were never properly stocked, and fresh supplies, enough to fill every stage, had to be ordered from the nurserymen every autumn and spring. Fifteen

hogsheads of ale were got rid of in that house in the twelve months by a household of teetotalers; the wine cellar needed the laying-down of expensive wines every year, although Miss Otterbourne no longer gave dinner-parties. A milliner and her assistant from Bath were engaged in Bewdley House half their time, yet Miss Otterbourne had only two new gowns in the year. Bewick's *British Birds* and *Fishes* and *Quadrupeds* deserted the shelves of the library, as if they were leaving the Ark of Noah, and turned up in a second-hand bookseller's at Bath. Valuable pieces of old Worcester china, fine Chelsea figures, unaccountably got mislaid; but certain dealers in London would have been happy to sell them back to the good lady.

'My servants,' said Miss Otterbourne, 'are perfectly trusty. I have left my purse about; I have allowed coppers to remain on my chimney-piece, and I have never lost a farthing.'

It is a curious fact that the conscience of many domestic servants draws a line at money. It is most rare to find one who will purloin a coin; but beyond that line, in far too many cases, all scruple ceases.

Josephine soon discovered how her mistress was being plundered. The housekeeper winked at the petty robberies; she shut her eyes to a good deal more that filled Josephine with horror and disgust. John Thomas Polkinghorn was vain and foolish, but he was not vicious. Among the many men attached to the house in one capacity or another, he was the most respectable; but the old butler, Vickary, on whom Miss Otterbourne chiefly relied as a trusty servant who had the interests of the family at heart, was a prime source of evil in the place. Josephine made him keep his distance. She behaved towards him with such proud reserve and scarce veiled abhorrence, that he scowled at her and prophesied her speedy dismissal. The other servants, all cringing to the butler, took his tone, and behaved to Josephine with insolence, at least in his presence. Yet, behind his back, they were ready to speak to her with kindness and show her little attentions. They let her understand that they groaned under his tyranny, but were too timorous to revolt. The house was, moreover, too good to be left, except for some extraordinary chance of betterment; and servants who came there well-intentioned, gradually swallowed their scruples and sank to the general level.

That Josephine was not more with them was due to the forethought of Mrs Sellwood, who wrote confidentially to her sister to tell her that Josephine had known better days, was well educated, and by birth a lady, forced by circumstances she was not at liberty to disclose, to go into menial service. Miss Otterbourne was the kindest-hearted of old maids, a generally kind-hearted race, but she was weak. She had fallen a prey to several unscrupulous ladies'-maids in succession. Girls well recommended had come to her, and the general bad tone of the house had lowered them; she herself had contributed to their deterioration by ill-judged kindness, by making of them confidantes, and almost friends. She had trusted them, when they were neither by education nor character worthy to be trusted. They had abused her kindness. One after another had taken to drink. Miss Otterbourne would not

believe it; she supposed poor Jane or Marianne or Emily was subject to fits, or had a weak heart; and Mrs Sellwood had sometimes to come down from Essex to rout a disagreeable and disreputable companion from her sister's house. The old lady, perhaps feeling her loneliness, and with her heart craving for love, was so liable to fall under the dominion of her servants, that Mrs Sellwood was glad to be able to assist Josephine and her own sister at once, to put the former with one who would be kind to her, and to give the latter a companion who was perfectly reliable.

Miss Otterbourne at once perceived that her new attendant was what her sister had described her—a lady, and with her natural kindness, did what lay in her power to soften to her the hardship of her lot.

On the morning after her arrival at Bewdley, Josephine rose with a weight on her heart. She had not slept well. She was pale, and her eyes looked large and sad when she appeared before Miss Otterbourne to assist her in dressing. The old lady spoke gently to her. She told her that she had heard from Mrs Sellwood that Josephine had met with troubles which had forced her into a situation for which she was not born, and assured her that she would be a good mistress to her, and not exact from her more than what was really needed.

'My servants are all so honest and so respectable, and so devoted to me, that I am sure you will like them. They never give me any trouble, and set a good example to the entire parish. But as you belong by birth to a superior class, you will not mix with them much. I shall expect you to be chiefly about my person, and when not engaged in dressing me, to attend to my wardrobe. I should be glad if you could read to me in the evenings. I cannot use my eyes by lamplight, at least not much; and the evenings are tedious to me. I play patience, but one tires in time even of patience.'

Later on, Miss Otterbourne made overtures to get into Josephine's confidence, but without avail. Josephine's secret was not one she cared to share. She soon fell into her work; it was not difficult, and the old lady was not exacting. She felt how considerate towards her Miss Otterbourne was, and she was grateful for it, but not inclined to open her heart to her. Miss Otterbourne was not one who could understand her course of conduct or appreciate her motives.

The monotonous life that Josephine was now leading, the constant restraint, the necessity for reserve, the tediousness of listening to the weak talk of the old lady, and the repugnance she felt for the society of her fellow-servants, were almost more than Josephine could bear, and only her strong resolution to go through with what she had undertaken kept her at Bewdley. As she began to see how completely Miss Otterbourne was deceived in her servants, how she was cheated, and what a demoralising influence in the place the trusty butler was, she became uneasy in mind; she did not like to allow her mistress to continue in her delusion, and yet she was averse from telling tales of her fellow-domestics.

The liking which Miss Otterbourne showed for her excited the jealousy of the female servants and the suspicion of Mr Vickary. This latter saw that he would not be able to influence Josephine

and get her under his power. He was irritated at the contempt she showed him, and aware that she saw through and mistrusted him. He also saw that she was acquiring a preponderating influence over the mistress, which threatened his supremacy.

Josephine had more to think about than her own past troubles; but, unfortunately, those concerns which now occupied her thoughts were in themselves troubles. She missed her old freedom; she was shy of asking a favour of Miss Otterbourne, or she would have entreated to be given a bedroom to herself. The old lady did not know that she had not one; the domestic arrangements were left to the housekeeper, and those maids were given separate rooms who stood highest in her favour. At night, Josephine hardly enjoyed refreshing sleep; she was not so much tired out with her work as fagged; her nerves were overwrought, not her muscles. What would she not now have given for a row on the sea or a stroll by herself in the garden! Sometimes the oppressiveness of her life threatened to drive her mad, and she made efforts to think of the sea, the gulls, the passing ships, to give breath and space to her mind, that was becoming cramped in Bewdley life.

While she read in the evenings to Miss Otterbourne, her mind was absent, for the books which the old lady selected were uninteresting to Josephine. She, like Aunt Judith, was a veal-eater, and must have her mental diet devoid of the blood of ideas and the firmness of intellectual growth. Josephine had been so independent hitherto, that the constraint of having in all things to submit to the will of another, to hear ineptitudes without replying, to go through a mechanical round of duties that led to nothing, were an especial trial to her. But she had the clear sense to see that it was a schooling she needed; she was learning self-restraint.

One evening the old lady was tired of the reading, did not care for patience, and, as she had a little of the fretfulness induced by nettlerash still about her, she began to grumble at never being able to hear a bit of music. With diffidence, and yet eagerness, Josephine volunteered to play and sing. She was diffident, because she did not know how her mistress would take the offer; she was eager, because she had not touched the piano since she left Hanford, and her soul was one that hungered and thirsted for music, a soul that could only find its full expression in pain or pleasure through music. Thus it came about that Richard Cable heard her sing on the night he was lingering under the trees of the park.

The little old lady was not without that atmosphere of romance hanging about her heart that enlarged and transformed common objects and gave them ephemeral and fantastic values and shapes. She thought about what Mrs Sellwood had told her of Josephine, and as she had taken a great fancy for Josephine, she wanted to learn more. She wrote for particulars to her sister, but unsuccessfully, and every attempt to wrest her story from the girl equally failed. As she had so few facts on which to build, she fell back on conjecture, and speedily came to treat her conjectures as assured realities. There could be no question that Josephine was a lady, the child of gentlefolks, who had been suddenly ruined—so,

she supposed—by the failure of the great Coast of Guinea Bank, which had recently brought down so many families. She was an orphan, and had lost everything, and she had fled her old home and its associations owing to a love-affair with a gentleman of position to whom she had been engaged, but who, having no resources himself, had broken off the match on her losing her fortune. Miss Otterbourne had in former days had several offers; but as she never could assure herself that the suitors were not in love with her estate rather than herself, she had refused them all; and now, in her old age, had a longing for a little romance, and a desire to take some part in the great concert of love that bursts from all creation, if she were only to play a little feeble accompaniment to the song of another. What a flutter it produces in an old heart on which hopes and loves have flashed and flickered and died out to white dust, to be able, before the last death-chill falls, to assist at the kindling, or to fan when lighted, or to sit by and hearken to the roar of a love-fire! So poor old Miss Otterbourne having made out to her own satisfaction and sincere conviction that Josephine was in love, and had been badly treated, turned the matter about in her mind, and schemed whether it were possible for her to take up the broken engagement and hammer and weld it together again. How she was to do this, she did not know. She did not even know the gentleman; but, again, imagination went to work and showed her that he was endeavouring to get into a government situation. Miss Otterbourne knew and was connected with persons of position and influence, and might possibly induce them to get him a secretaryship or a colonial appointment. The kind little heart made its plans; the letters were thought out, and the list of those to whom application was to be made was drawn up; all that Miss Otterbourne needed to know to put all her engines in play was the name and position of the man. But when she approached the subject, however delicately, Josephine winced, changed colour, trembled, and entreated permission to leave the room.

'There is no help for it,' said Miss Otterbourne to herself; 'I must wait till I have gained her confidence.—Poor young people! Poor dear girl! She is growing thin and pale here. I can see the change in her. Hope deferred maketh the heart sick. It is only hope deferred, not extinguished. I am clever in these matters; I will make all right in time.'

Miss Otterbourne was warmly attached to her nephew, Captain Sellwood, who would succeed to Bewdley after her decease, when he would assume by royal license the name and arms of Otterbourne in addition to Sellwood. The old lady had much family pride in her, and loved to talk of the family greatness, its achievements and its matches in the past. It was a sad thing that Cholmondeley Otterbourne, her brother, had died early, and that thus the direct male representation ceased. As the old lady loved to talk, and loved especially to talk of her nephew, on whom her ambition concentrated, she was not silent with Josephine.

'I suppose you have seen him, Cable?' she said. 'If you know Mrs Sellwood, you have no doubt seen the captain. He is a very fine man, and has such splendid eyes, like those of an ox. I wish he would marry. I am getting to be an old woman,

and I want to see the young generation settled, and another rising about it. I should be happy, I think, quite happy, with little grand nephews and nieces, nephews especially, trotting about these passages, and up and down the stairs. I am afraid that Captain Sellwood must have met with a disappointment.—You have not heard of such a rumour, have you, Cable ?

'There has been no such tale, Miss Otterbourne, as far as I am aware.'

'I cannot conceive of a girl refusing him, he is so handsome, so dignified, and has such eyes, such ox-like eyes. If he has been refused, it must have been by some great heiress, who thinks overweeningly of herself ; or by a duke's daughter, or a baroness in her own right.—You have seen Captain Sellwood, I suppose, Cable ?

'Yes, ma'am, I have seen him.' She always spoke respectfully to Miss Otterbourne, as a servant to a mistress.

'What do you think of him ? Have you ever seen his equal ?—Except'— The old lady laughed. 'That is not quite a fair question ;' she assumed a roguish air. 'Every girl thinks one man the ideal of what man should be, but after—that one, eh, Cable ?

Josephine hesitated ; then evaded the answer by saying : 'I spoke the exact truth, Miss Otterbourne, about there being no reports circulating concerning Captain Sellwood ; but I believe it is true, and Mr and Mrs Sellwood know it, that he was refused.'

'Who was she ?' asked Miss Otterbourne.

'A very unworthy person,' answered Josephine.

That the captain was certain to visit Bewdley, and that she would have to meet him—she in the capacity of a servant, occurred to Josephine, and made her uneasy. But on further consideration, this uneasiness passed away. It was bred of pride, and her pride was much broken. The prospect that he would come to Bewdley gave her courage and hope. Before he arrived, he would have been prepared to see her—his father or mother would be certain to do that.

She thought a good deal about him, as Miss Otterbourne spoke of him so frequently ; and she trusted that his arrival would relieve her from one of her great distresses. She could mention to him the condition of affairs in the house. As heir to the estate, as the person responsible next to her mistress, he ought to be told everything. Then he could act as he saw fit. She would have fulfilled her duty, and the responsibility would rest on the proper shoulders.

'Captain Sellwood comes on Tuesday,' said Miss Otterbourne one day. 'Tell Mrs Grundy to have the Blue Room ready.'

Josephine drew a long breath. 'I am so glad !' she said. The exclamation escaped her unintentionally. Miss Otterbourne looked surprised, and then annoyed, and said no more to her that evening.

#### CHAPTER XLVI.—A CHUM.

Once, annually, whilst he was in England, did Captain Sellwood pay his aunt a visit. He stayed with her a fortnight ; and she took him round to show him to her old friends, and show him the young ladies of the neighbourhood among whom he was at liberty to pick and choose—ladies by birth and breeding, and with at least

something to bring with them. As yet he had not picked and chosen in the region round Bewdley ; he had contented himself with exciting the admiration of the old ladies, to whom he devoted himself with more eagerness than to the young. They were his aunt's cronies, and he made an effort to please his aunt by showing courtesy to her friends.

The family coach went to the station to meet the captain, and Miss Otterbourne awaited his arrival impatiently. Josephine's heart was in a flutter. 'Shall I leave the room ?' she asked, suddenly rising from her needlework in the window. Miss Otterbourne had got into the way of making her sit in the same room with her much of her time.

'No, Cable,' answered the old lady—'no need for that. You have, I daresay, seen the captain, and he will probably know you.'

In fact, Miss Otterbourne was curious to observe how they met ; for she knew nothing for certain about Josephine's origin, nor of the extent of her acquaintance, nor of its character, with the Sellwoods.

Josephine remained, but stood silent, in the window, withdrawn as much as possible from sight. Captain Sellwood came in, and was greeted with love and pride by his aunt. 'My dear fellow ! How you have grown ! But—I do believe I see a careworn expression in your face, as if the course of something—something—had not run smooth.'

He turned abruptly from her and came directly to Josephine, who, in spite of her efforts to remain composed, coloured and trembled. 'We have met before—at Hanford,' he said, with a bow, and extended hand ; but whether he spoke to explain his conduct to his aunt, or to introduce himself to Josephine, who might not recollect him, Miss Otterbourne could not discover.

'You will be pleased to hear that the rector and my mother are in flourishing condition,' he went on. 'I hope I may be able to inform them, when I write, that you are well and happy.' He spoke civilly, formally, yet kindly ; and what he said might have been addressed indiscriminately to a lady or a lady's maid.

'The rogue !' said Miss Otterbourne to herself. 'He, also, wants to keep me in the dark. There is some mystery ; but I shall worm it out.'

Josephine kept away from the drawing-room whilst the captain was there ; her mistress did not need her when she had her nephew to talk to. She hoped to have an opportunity of speaking with him in private before long, that she might relieve her mind, after which it was her intention to leave the service of Miss Otterbourne. It did not advantage her to remain there longer. Her mistress had drawn her into association with herself, and she could associate with ladies as at Hanford. As for the servants at Bewdley, she did not wish to be on terms of familiarity with them. They did not represent the class to which Richard belonged. She must seek representatives of his order elsewhere.

One evening, the housemaid who shared her room told her that a sister and cousin had come to Bewdley and had asked her to meet them and walk with them to the station. She had, however, her duties in the house, and could not go out, leaving these neglected. As for the under-

housemaid, she was engaged with her own work, and could not be trusted to arrange the rooms—would Josephine mind relieving her of this for an hour or two. 'It's the captain's two rooms have to be looked after,' said the young woman. 'If you'll do this for me to-day, Cable, I'll help you what I can another time.'

Josephine at once, good-naturedly, consented.

Captain Sellwood occupied the best bedroom, with a small sitting-room adjoining, and on the other side a dressing-room. He did not care for a fire in his bedroom; but there was one in the sitting-room, and there his aunt allowed him to smoke. He had no valet with him to attend to his clothes; and after he was dressed for dinner, the housemaid folded those he had taken off and put them away, and got the room ready for the night. The sitting-room had to be made tidy: the scraps of letters and envelopes to be picked up; his newspaper to be folded and placed on the table; his cigar end, left on the mantel-shelf, to be buried in the red depths of the fire; a flower-glass upset on the side-table, to be refilled, the blossoms rearranged, and the water to be wiped up. How untidy men are!—No, not all men—not Richard. And had not Josephine been just as careless when in her own house?

She put everything together in the sitting-room. Captain Sellwood had worn gloves lined with swansdown, which his mother had insisted on his wearing whilst on the journey; but either the moth had got into them, or the down was badly put on at first, and, as he found the wool coming off, whilst he was smoking he amused himself with picking it off the inside of his gloves and throwing little tufts on the floor, where it adhered to the pile of the Brussels carpet. The collecting of this down engaged Josephine some time, and she said to herself: 'If people only knew the trouble they give by their want of consideration!' and then remembered she would have done the same in former years. She was engaged picking the particles out of the carpet pile, when the bedroom door opened and Captain Sellwood came in, with one patent-leather boot on his foot and the other in his hand. Josephine looked up as the door opened, and rose.

'Oh,' said he, 'I am sorry. There is a peg in the sole that hurts me, and I have come for the poker to drive it down.'

Josephine rose from her knees, colouring.

'Do not let me disturb you,' he said. 'I will go away.' He had a crimson silk stocking on his unshod foot.

'Shall I knock down the peg for you, Captain Sellwood?' asked Josephine. 'There is a hammer in the housemaid's cupboard.'

'Not on any consideration; but if you will kindly fetch me the hammer, I shall be grateful. I do not know the whereabouts of the said cupboard.' He held out his hand to help her up.

'What have you been about?' he asked.

'Collecting all these particles of swansdown. They are difficult to get out of the carpet.'

'I threw them there,' he said; 'but I am glad it has given me the opportunity of speaking to you alone, which I have desired, and failed to get.'

'I also,' said Josephine, 'wish to have a little private talk with you; but'— She looked

round, and seeing that some one was in the corridor and that the door of the sitting-room was open, she added: 'I will get the hammer for your boot at once.' Then she went out at the door and closed it behind her. She had a candle in her hand, and saw standing before her the butler, with a mocking expression on his sinister face.

'What are you doing there, Cable? You have no business in these rooms.'

She would rather not have answered him, and have passed on without a reply; but she considered that she had to return, and that the butler must be got rid of, so she answered with as much indifference as she could assume, that the housemaid was going to the station with her friends, and had asked her to see to the bedrooms.

'And to chat with the captain, who slipped away from table before his usual time.'

Josephine coloured at his insolence. She had taken Captain Sellwood's boot in her hand, and whether advisable or not, she must return with it. She went her way without appearing to notice the remark made by the butler. In ten minutes she returned with the boot; she had succeeded in knocking down the peg. As she came to the captain's door she looked round to see that the coast was clear, and then tapped lightly. He opened at once, and she went in.

She was nervous and agitated. The situation was not a pleasant one; and if she had not made up her mind to speak to him, she would have given him the boot at the door and not have gone in. But three or four days of his visit to his aunt had elapsed without her obtaining the opportunity she sought, and she did not see how she could obtain the desired interview without attracting attention and arousing curiosity.

Mr Vickary was probably satisfied with the explanation she had given. If he doubted it, he could satisfy himself in the kitchen that it was genuine. Notwithstanding her bringing-up, Josephine had much guilelessness in her. She knew Captain Sellwood well, had known him since she was a child, and was aware that he was an honourable man, who would never forget the respect due to her. He knew her story—that she was married; and that she had met with trouble. That he knew why she had gone into service, she did not suppose. He was aware that she had resigned her right to the inheritance of Gabriel Gotham—all Hanford knew that; but the reasons for her so doing were not divulged. The captain, she presumed, thought she had been forced to take service because she was left penniless. That he would not press her to tell him anything she kept to herself, she was well satisfied. He was a gentleman, if a somewhat heavy one.

She closed the door behind her, and went towards Captain Sellwood with something of her old frankness, holding his boot in her hand. 'I must have a little talk with you,' she said. 'And there is no time like the present. I hold you arrested by one foot. You shall not have your boot till you have listened to me.'

'I am not likely to run away from you, Mrs Cable, unless you draw out of your quiver some of your old arrows; then, knowing their sharpness, I might in self-defence take to flight.'

'No; I have broken off all their heads. I will never hurt any one again—at least not with them.'

'Take a chair, Mrs Cable.'

'I had rather stand.'

'And I insist on your being seated.'

She obeyed, taking a small armchair near the fire. He had lighted the candles on the mantelpiece, and stood by the fire, with his elbow on the shelf, resting on his shod foot, with the red-stocking foot crossed over the other.

'The matter about which I desire to speak to you,' she said, going at once to her point, 'concerns Miss Otterbourne. You and your mother ought to know how she is treated by her servants. She is robbed on all sides. She is surrounded by perfectly unscrupulous persons, who are in league against her. There are valuables in this house, heirlooms; nothing is safe from their rapacity. Dear Miss Otterbourne is so confiding that she leaves everything about—her keys, her cheque-book; her drawers are not locked, and any one can get at her jewelry. The plate is intrusted to Mr Vickary, and—some one ought to be intrusted with the looking after of Mr Vickary. Is there a list of the plate? Do you think Miss Otterbourne herself knows what family jewels she has? I have ventured to entreat her to keep her bureau locked where she has some securities,—she ought to send them to her banker's; but she likes to retain them in her own hands. I am sure the butler has been to that bureau, though I will not say he has abstracted anything. What I fear is—were anything to happen to your aunt—suppose a stroke, which is not impossible or improbable at her age, then—this house would be at the disposal of her servants. They might take what they liked, and who would stop them? An old lady ought never to be left as Miss Otterbourne is—without a relative by her to guard her interests.'

'Dear Mrs Cable,' said Captain Sellwood, 'my mother cannot be here. It is also out of the question that I should. We had hoped—when you came'—

'Exactly, that I was to be life and bodyguard to Her Majesty. I do not feel disposed to be that. I tell you the state of affairs, and then I go. I cannot remain here. Miss Otterbourne is very kind, and I like her; but I cannot remain. You can see that for yourself. Having revealed the misdemeanours of my fellow-servants, I must go as well as they.'

'I do not see that.'

'I do. I could not stay. There are other matters behind all this that I have told you; but you know enough.'

'What is to be done?'

'What is to be done?' repeated Josephine, with a return to her old contemptuous manner. 'You are a man, a soldier, and ask me that!'

'Precisely; because I am a man and a soldier, I know nothing about domestic matters; I cannot engage a new set of servants.'

'But you can induce your aunt to dismiss these.'

'And I know very well that with a new supply she would fare no better. She has had relays of ladies-maids, and has demoralised them all—made very decent girls my mother has sent her, dishonest and given to drink.'

'Well, I have discharged my duty. It is for you to act on the information you have received. This house not only demoralises the ladies-maids, but the entire parish. Your good old aunt, with a mind full of religion and kindness, is poisoning every man, woman, and child who comes near her. Trust is a very good thing when well applied; but trust given to the untrustworthy aggravates the evil. Why, what will become of the servant-girls of this establishment when they marry? They have learned here to be dainty, thriftless, and dishonest; to take to themselves whatever comes to hand, and to use everything without consideration what it costs. They will make their husbands and families wretched and wicked.' Josephine spoke with vehemence, because she felt strongly, and had been bottling up her indignation ever since she had begun to see into the condition of affairs in the house, without the opportunity of giving it vent.

Captain Sellwood stood looking down at his unbooted foot, meditating. His face was troubled. 'It would be conferring on us the greatest favour, it would be laying us under a lifelong obligation, if you would consent to stay as companion to my aunt.'

'I cannot. The captain who applies the match to the powder-room does not blow up the crew and provide for his own safety—they all go up into the air together. I cannot do what seems mean.'

'We have no claim whatever on you; but you are here on the spot—if'—

'No, Captain Sellwood—no! How slow you are to take a no!'

Then ensued another silence.

'I have said what I had to say, and now I must go.' She made a motion to rise. He waved his hand.

'I pray you, one moment longer. About yourself. If you insist on leaving this house, where will you go?'

'I do not know. I have not considered.'

'Excuse me, Mrs Cable. I do not want to touch on matters that I have no right to put my finger on, but—we are old acquaintances of many, many years' standing. I cannot bear to think of your being in positions to which you were not born. Do not be offended. I am a clumsy man with my tongue, as you know very well.' He spoke with such truth and kindness, such real feeling in his voice, that Josephine's heart grew soft. 'I ask no questions; I want to know nothing about any of these matters that have occurred and that have affected you; but I do pray you—I pray you—do nothing without consulting my mother; and do not—do not be too proud to take her helping hand. Indeed, you can do my mother no greater favour than ask her to help you in any and every way.'

Josephine did not answer at once. It was not possible for her to answer with frankness without entering into an explanation of her circumstances, which she could not do to him. After thinking, and turning his boot about in her hand, she said: 'I am very sensible, Captain Sellwood, of your kindness; and I know how good and generous your dear mother is, and how I can rely as well on your father. He approves of all I have done. You must not think me wanting in generosity

if I change the subject. You have drawn the conversation away from your aunt to me, and I had rather not have it turn about myself, but revert to what we spoke of at first.'

'As you will, Mrs Cable.'

'I think that you must get a gentlewoman to live here as companion to Miss Otterbourne, and strike at once at Mr Vickary. The house-keeper and the maid-servants are not bad-hearted; but no one in the household has the moral courage to withstand him. Try to induce your aunt to part with him and take a suitable companion. Then the servants' hall can be weeded leisurely.'

A tap at the door. The captain called out to come in, and Josephine looked round to see who asked admission. She was thinking only of what she was saying, and had forgotten where she was, and how strange it would seem to any one opening the door for her to be seated by Captain Sellwood's fire in his private sitting and smoking room talking confidentially with him.

In the doorway stood Miss Otterbourne; and Josephine caught a glimpse of the butler gliding away from behind her. 'Really!' exclaimed the old lady—'really—I am surprised—I—I'—

'There is your boot, Captain Sellwood,' said Josephine, starting up, suddenly conscious of her situation, and hurriedly left the room.

He took the boot, and slowly and clumsily drew it on. He also saw what an awkward position they had been in.

'Can you allow me a tête-à-tête?' asked the old lady somewhat stiffly; 'or—do you prefer younger society?'

'It was,' he stammered—'my—my boot that we were engaged upon. We are old chums; we were chumming, aunt, only chumming.'

### AMERICANS ABROAD.

THE summer-tide of American tourists on 'the European trip' causes the transatlantic liners to be heavily laden with passengers, who have booked for months ahead their places in the favourite steamers, and, what is more, in thoroughly American fashion, settled by what vessel they will return in the 'fall.' The weekly arrivals at Liverpool from 'the other side' can be counted by thousands; few sights, indeed, are more calculated to excite reflection than the counter-currents which the great Lancashire port daily sees; the outward flood of sturdy emigrants in search of fortunes 'West' crossing with the incoming wave of American visitors, who, having achieved an instalment of their share of the world's success, come to seek in the Old World those pleasures from which the emigrant has often so unwillingly exiled himself. Time was, when we Britons were the great travelling nation, and though we still well keep up our reputation in this respect, it is useless to deny that we are outdone by our 'kin beyond the sea,' to whom a European trip is much more of a necessity, social and pleasurable, than is the case with us, near as we are to the continent. In America, indeed, every one travels; but the enormous distances which the Americans find themselves called upon to traverse—distances of which we in Europe can by comparison form but a very scant idea—count as nothing till the Atlantic has been crossed. The 'ocean trip' may be said to be the first

necessary extravagance which the successful American lavishes on himself and his family; no matter in what station, one visit at least to Europe is a social, almost a national obligation; while in the more established sections of society it will be found that every one has either 'just been' to Europe, or is 'just going,' or has 'just returned.' We in Britain see almost without exception every American who leaves his country, and the American traveller is nowadays a very familiar object on our railways, which he likes; and in our hotels, which he freely criticises; or scattered over the various places of interest, which it will be found our cousins are far more assiduous in seeing than ourselves.

Perhaps it is on the score of the familiarity we are gaining with the American traveller that British people are so ready with their opinions as to 'Americans.' In a mixed company where the subject is discussed, the variety of views expressed is somewhat apt to be conflicting; and, truth to tell, even to the impartial judge, a candid opinion on the point is difficult. To those who know Americans well, it is only too evident that of late years a marked change is observable in the character of the American tourist as he is to be met with in Britain and on the continent. The low fares and quick passages, the sudden fortunes made 'out West,' among many other reasons, have tended to alter entirely the whole nature of the ocean trip, just as similar conditions may be said in the Old World to have materially modified the character of foreign travel. It is no longer possible, therefore, to pass a hasty generalisation on the American traveller; for he will be found, by those to whom he is familiar in his several phases, to vary considerably, from the highest type of the still existing Southern gentleman, who, to all but the keenest observation, would pass unnoticed in a crowd of correct English people, to the unmistakable 'Western' or 'down-Easter,' the cut of whose clothes, hat, and boots, not to speak of a manner thoroughly in accord with his shrill and monotonously toned accent, betray themselves instantly.

Of late years, the crowd of American tourists abroad has been thus divisible into several distinct sections, foremost among these coming the demonstrative American, contrasting in a very marked manner with the excessively correct New-Yorker or Bostonian, whose tone is professedly 'English, quite English, you know;' whose pride it is to be mistaken for a native of this country; whose clothes are faultlessly British in material and style, and whose disgust at his loud-toned compatriots is scarcely to be concealed. It is indeed a singular feature of modern American existence—it might almost be said of modern civilisation, the terms, according to some, being interchangeable—that there is to be found in America a certain section of the community who openly express a contempt for everything 'American.' Probably none are louder in the expression of this feeling than the American women, who form perhaps the largest number of American residents in Europe. It is easy to see how the conditions of existence on 'the other side' have led to this curious state of affairs. In America, there is no 'leisure class;' every member of the community as a rule is actively engaged in commerce; and commerce in America

is followed with a feverish ardour unknown in our 'effete old world.' As a matter of course, the women are entirely outside this interest. Educated in many respects with greater care than their sisters in Europe; leading generally what has not unfitly been termed a hothouse existence; freed in great part from the many domestic cares which occupy so largely the time and attention of women over here; voracious readers of cosmopolitan literature, English, French, and German; looking to Europe for every inspiration of refinement, from the last new fashion in dress or house decoration to the latest novel or the last new opera—it is little wonder that, amidst the uncongenial atmosphere of 'home,' the American woman who has any aspirations sighs to reach the land of promise across the ocean. The sacrifices that are often made by American ladies to complete their studies in Europe are scarcely to be imagined by their British sisters, and are indeed only familiar to those who either know America well, or are constant readers of American literature. The bravery with which a young American girl will leave home unescorted and settle down alone in London or Paris, or in some German town, to pursue the study of the languages, of music or painting, is a feature which can solely be explained, by the complex nature of American life. Such ladies form a considerable section of the resident Americans whom we have among us. They keep very much to themselves, and bear their many trials very patiently, aware as they are of the privileges they are enjoying at such a moderate rate. As a class, they can alone be compared with the many young American painters who are crowding the *ateliers* of Paris and Munich, and whose ability to exist on next to nothing is a standing wonder even to the frugal and thrifty foreign art student.

To these sets of Americans to be met abroad, there are to be added the various resident colonies 'located' in Paris and London, or scattered about in the more pleasant European resorts of pleasure and fashion—colonies in great part made up of grass-widows, whose husbands are mysteriously absent in the States for years at a time. To this section of the Americans resident abroad, the typical Western tourist is a standing source of horror: his openly expressed irreverence for the most hallowed of the Old World traditions; his independence of views on every matter of art and culture generally; his very appearance—are criticised by his own compatriots even more severely than by us. Happily, the proportion of Americans who are ashamed of their country and its deficiencies is comparatively small, and their influence inconsiderable, for they constitute an anomaly such as will be found in no other nation.

Socially speaking, from our European point of view, such 'conscious' Americans, as Mr James has termed them, may be more agreeable than their uncouth countrymen; yet, let it not be forgotten that it is with the rawboned, broadcloth-covered, broad-shouldered, slouch-hatted 'Yankees' who protrude their presence so conspicuously, that the future destinies of America rest; by them its wonderful past has been moulded. It is not with the namby-pamby American—too usually a snobbish worshipper of the rank and family in which

he is deficient, and a connection with which he is ever eager to prove—that is to be found the eagerness, the energy, and aspiration which have induced America to fly her kite, and in many cases successfully, at every object of excellence, and of which such singular proofs have been given at the Exhibition at Earl's Court, where have been seen, if not exactly under one roof, at least in one enclosure, the aborigines of the still undeveloped West—redskins unable to communicate except through an interpreter, side by side with the latest inventions and creations of science and art, produced by a nation which, within but a few years, has reclaimed from solitude and savagery the great continent which stretches from the stormy shores of the Atlantic to the quiet depths of the Pacific.

## THE JULLABAD TRAGEDY.

### CHAPTER II.—WHO DID IT?

WHEN the first sensation of horror produced by the burning of Colonel Humby's bungalow—a sensation, it must be noted, due not so much to the conflagration itself as to the tragic possibilities which might be involved in it—gave way to the natural excitement incident to such an occurrence, a rush took place from the Assembly Rooms in the direction of the fire. In a few minutes every man in the station was on the spot. The spectacle which met our eyes as the first of us arrived was an awful one. The natives stood together in groups at a distance, dumb and shivering with terror. The bungalow was an old one, heavily thatched, and as dry as tinder. All the water of the Indus would not have saved it. The fire devoured it in one monstrous mouthful, and was licking the bare and blackened walls when we reached the place. The personal interest of the writer of this narrative in that scene was deeper than that of any other man in Jullabad. I was the Lieutenant Charles Everest more than once mentioned. I had seen Mrs Humby in the radiance of her beautiful and happy maidenhood, and realised more than any one else her strange and unhappy fate in falling into the hands of this man. I had had her in my arms, unconscious indeed, and as I then believed, dying, and the thrill of the contact was still upon me. In my heart of hearts, I believed that her husband, for some reason known only to himself—and perhaps to her—was compassing her death—driving her to it in such manner as to insure his own safety from the law. Murders of that class are every year committed with impunity where women are weak and men are brutal. And the horror of horrors which momentarily paralysed me, gazing on the gutted and smoking bungalow, was the dread conviction that Humby had himself set fire to the house, in order to burn his sick and helpless wife in her bed.

I recognised among the natives a *Khidmatgar* belonging to Colonel Humby's household, and beckoned the man to me. 'Who were in the bungalow when the fire broke out?' I asked.

'Sahib and Mem-Sahib,' was the answer.

'Where are they now?'

The man shook his head and answered, trembling: 'I don't know, sir.'

A quick inquiry among the others elicited the

horrifying fact that neither Colonel Humby nor his wife had been seen by any of them. All this had not occupied sixty seconds from the moment of our reaching the spot. I staggered, rather than walked, back to the others. 'I believe they have both been burned to death,' I said. 'Let us search the ruin.'

'I feared as much, at least in the case of Colonel Humby,' replied one of the men, as we moved towards the bungalow. 'I saw him driven home this evening so intoxicated that, if he took any more, he must have fallen in a stupor. What an awful death!'

'If he were the only victim, the holocaust would matter little,' I said; and then we commenced our search.

The ground beneath our thin shoes was hot, and the smoke rising from the embers blinded us. We went round the veranda first. All that remained here was a portion of a rocking-chair, with a partially burnt shawl on the floor near it, and a pair of lady's slippers. Mrs Humby must have been sitting in that chair. Had she left her shoes in the veranda and walked to her chamber without them?

I did not know which room she had occupied in the bungalow, and the walls were red-hot and crumbling, which made it dangerous to enter them. But the strain of my anxiety was so painful that more than this would not have held me back. My eyes were smarting from the pungent smoke, my feet blistering from the heat of the brick floor through the dancing-shoes which I wore. I rushed through two or three rooms. There was nothing but smoke and ashes and smouldering pieces of timber. Every combustible thing was consumed. I escaped a falling wall by leaping back just as it fell in a heap. At the same instant from an adjoining apartment came a shout of horror. I thought some other explorer had been killed or injured, and I clambered over the fallen masonry to the place. It was sickening. I will make no attempt to describe it. Colonel Humby had been roasted to a cinder on his bed. The attitude in which the body was discovered suggested that the stupor of intoxication had passed into that of asphyxia, and that he had not moved a limb in the furnace of death. The iron bedstead was the only thing unburned in the chamber. Something was thrown over the remains, and we reeled out of the fearful presence.

Outside the walls, I asked if any person had discovered a trace of Mrs Humby. 'If not,' I said, 'further search must be made. It will be awful if she has been burned to death too!'

'No occasion to be anxious, Mr Everest,' said a dry Scottish voice behind me; 'she is quite safe, I assure you!'

I turned quickly with a start. The speaker was Colonel Jack, our cantonment magistrate, as unemotional and honest a Scotsman as ever came from north of the Tweed. His assurance, as may readily be imagined, was a welcome one—I could have thrown myself, woman-like, on the old fellow's neck for his words—but something in the very dryness of his voice was uncomfortable to my feelings of relief and gratitude. However, it was no time for analysing fancies; it was an intense gratification to everybody to know that poor Mrs Humby had somehow—no one as yet knew how—escaped from

the holocaust, and was now safe and well in the bungalow of Colonel Jack. Excepting our mess-house, that of Colonel Jack was the nearest refuge.

Next day, she received numerous calls of sympathy from the ladies of Jullabad. Associated with their natural sympathy for the poor girl was, of course, a considerable amount of equally natural interest in the particulars of the catastrophe of the previous night. They came away much disappointed. Mrs Humby was grateful for their sympathy, but recoiled, with a look of fear that was mystifying, from every reference to the burning of the bungalow and the fate of her husband. Even Mrs Jack, who was ministering to her with the solicitude of a mother, could not bring her to speak upon the subject.

'She seems so dazed, poor child!' said Mrs Speedy at a tea-drinking that evening; 'I fear her brain is a little affected.'

'I shouldn't have been surprised if it had been affected before now,' observed another lady. 'The life she has led in Jullabad would drive many women mad.'

'Ah,' said Mrs Speedy, shaking her head, 'she hadn't spirit enough to be driven mad. It is melancholy such passive women as Mrs Humby are driven into—or rather, they quietly sink into it.'

Colonel Jack, however, as cantonment magistrate, found it necessary to inquire into the circumstances of the fire and of the Deputy-Commissioner's death; and in the course of a few days these became tolerably well known. Mrs Humby had been examined, as well as those of the dead man's native servants who were able to throw any light upon the matter.

Colonel Humby had come home that afternoon very much the worse of drink. His wife was sitting in the veranda—for the first time after her illness—when she heard him staggering through the rooms within. She had just given some silver bangles (ornaments so dear to the natives) to an interesting child of six belonging to the *bawarchi* (or cook), and the man was standing a few paces off, with folded hands, regarding the child with eyes beaming pleasure and gratefulness. The natives are passionately fond of their children, and the least indulgence to their little ones wins their affections. In this way the solitary wife had made herself attached friends among her dusky menials—the only friends she had.

Suddenly the native started nervously on hearing the 'Sahib' in the bungalow, and with a quick but respectful salaam to his mistress, snatched up his little girl and hurried away to his cookhouse. The colonel, however, had seen him leave the veranda with the child, and the incident was enough for his ill-temper.

'Is there any tiffin ready?' he demanded, reeling up to where his wife sat.—'What has that fellow been doing here with his black spawn?'

'I was giving the child some bangles,' was the answer. 'I had promised them before—I fell ill.'

'Bangles? Let me catch the brat and it shall get something else!—D'ye hear me, madam? I'll have no more philandering with these niggers—the fellow would cut your throat as soon as thank you—and serve you right!'

Colonel Humby emphasised what he said by shaking his clenched fist in his wife's face. She merely turned her head another way. He looked in a more than usually savage mood; and she breathed more freely when, after half a minute's pause, he walked away from where she sat. She hoped he would go in and throw himself on a couch to sleep the fit off. But he was in a temper for mischief, and instead of doing so, he staggered over the compound to the cookhouse. Mrs Humby held her breath. There was a cry of pain from the poor cook, followed by a scream from the child, and Colonel Humby immediately appeared at the door of the cookhouse actually dragging the little girl after him by the hair. At the door he swung her round in front, and flung the little body from him with a kick, like a football. Before picking the child from the ground, the cook stood a moment regarding his master with a look which, drunk as he was, might have done much to sober Colonel Humby had he seen it. But he was on his way back to the house; and by the time tiffin was laid for him, was lying on his back asleep.

Colonel Humby rose about half-past seven, had some dinner by himself, and afterwards sat in the veranda smoking and drinking brandy-and-water for an hour. Mrs Humby was lying on her bed, dressed, at about nine o'clock, when she heard her husband go into his own room and close the door. At this point the mystery of the event began. The cook—his name was Sinya—lived in the native bazaar, some distance across the station, and after removing the dinner and performing the remaining duties of the day, he shut his cookhouse and went home to see after his child. He did not return again until after the place had been burned, so that he was able to throw no light on the origin of the fire.

The *khidmatgar* deposed to paraffin lamps being burning in the drawing-room, the dining-room, and in the bedrooms of Mrs Humby and her husband. This was the usual practice, and except the dining-room lamp—which was extinguished at ten—they were left burning all night. The lamp in Colonel Humby's room was placed on a table, a distance of several feet from the bed. On the theory that he had accidentally overturned the lamp and thus originated the fire, how was his position on the bed—the position in which his charred remains were discovered—to be accounted for? Only by assuming that after overturning the lamp and setting the fire going, he was too stupefied with brandy to be conscious of the accident, or to be aroused to consciousness by the fierce flare which must have immediately enveloped him. Was this possible? Did the unfortunate man, after upsetting the lamp, stagger to his bed and lie there inert to be roasted?

Upon one point the *khidmatgar* was positive: Colonel Humby never smoked in his bedroom. He smoked little as a rule, but never in the bedroom. The possibility of the fire originating in this way was consequently out of the question.

Mrs Humby, as has been said, was lying on her bed dressed. Some time between nine and ten o'clock, she dropped asleep. She heard no sound from the direction of her husband's apartment after he closed the door. But she had not been long asleep when she was startled into wakefulness by a rough hand grasping her throat and

choking her! With the strength of desperation, she uttered a shriek of terror, and then the fingers relaxed their hold; the man rushed from the room, and a volume of smoke poured in through the door as he did so.

The strangest part of the story was her declaration—reluctantly wrung from her by pressure of repeated questioning—that her assailant was her husband! When awakened by the hand upon her throat, the lamp in her room was extinguished; but when he turned outside the door, the glare of the fire fell upon him, dressed in his every-day suit of Scotch tweed, and wearing his helmet with the green and yellow *puggaree* which was invariably around it. Mrs Humby sprang from the bed and fled for her life to the bungalow of Colonel Jack, where she fell fainting in the veranda.

It was not for three or four days that Mrs Humby could be induced to speak on the occurrences of the dreadful night; and it was only by pertinacious persistence that Colonel Jack obtained from her the foregoing statement of what she remembered. She was not in the least mentally affected by the shock, as the ladies had supposed her to be; she spoke like one having a clear and reliable memory, when she did speak. But the simple and unaffected tenacity with which, when over and over again questioned in every variety of way, she held to the accuracy of that extraordinary statement, was literally staggering.

Of course there was no other topic of conversation in Jullabad now. Not a man of us doubted the entire and childlike truthfulness of Mrs Humby. But accepting her statement, we were confronted with what looked to be an unfathomable mystery. No one denied that Colonel Humby was capable of murdering his unhappy wife; that his murderous fingers were fastened on her throat was in itself possible enough, assuming the man so intoxicated as to be reckless of his own safety. He had not completed the attempted murder—and the bungalow was on fire at the time he attempted it. Was it his fiendish intention first to strangle her, and then consume the traces of his guilt in the fire? Many thought this suggestion the most plausible one. Knowing Humby as all knew him, it would be quite consistent with his character. Cruelty not killing her rapidly enough, a scheme like this would be the very one to do it for him. Charred remains would show no finger-marks on the throat, would defy the terrors of a post-mortem examination. But the men who held hardest to this theory—and let it be noted that Mrs Humby's throat showed distinct marks of the attempted strangulation—were dumfounded and mystified by two obvious questions: Would Colonel Humby have been scared from the completion of his murderous intent by the awakening scream of his victim? Would he, having allowed himself to be so scared, have left the chamber-door open for her escape, gone back to his own room, and deliberately laid himself on his bed to be roasted to death?

The wildness of the excitement which exercised people's imaginations in Jullabad may be judged from the fact that a new sensation was created by the suggestion that the charred and, of course, unidentifiable remains found upon the bed were not those of Colonel Humby, but of somebody else! If it were only possible to fix the identity

upon somebody else, with any fair amount of plausibility, this suggestion might have been accepted. But it was not found possible.

'I, for one,' said our charming Lady O'Reilly, who was very outspoken all through the dreadful business, 'should be extremely sorry if such a story were true. I should never get over the disappointment of knowing that Colonel Humby had only been burned by proxy!'

In India, we are thrown entirely upon our own resources in such a sensational emergency as this. We have no enterprising press to inform us of all the mysterious ins and outs of the affair. The two newspapers which we received were published at the far-away cities of Lahore and Allahabad: the former we generally got either one or two days after issue; the latter, three, four, or even five. Neither could possibly command such machinery for the collection of news, and especially for the investigation of a tragedy like ours, as people at home are accustomed to. They depended entirely on voluntary reports from residents. Their reports, therefore, were a good way behind our own information, and were perused by us with a merely languid interest. But the *Pioneer* of Allahabad took our breath away some ten days after the tragedy, just as we had begun to despair of ever finding a satisfactory explanation of the still mysterious occurrence, with a report—dated from Jullabad—that the conviction was at last forcing itself on the public mind that the author of the fire, and the agent of Colonel Humby's death, could be no other than—Mrs Humby herself!

A thunderbolt could not have fallen with more astounding effect. The sensation created by this announcement was in itself evidence that one portion of it at least was entirely false—that 'the conviction was at last forcing itself on the public mind.' Not a whisper—nay, I believe, not a thought—of such a solution of the mystery had passed in the station.

Who had furnished the newspaper with that report? Somebody in Jullabad must have done so, but none could guess his identity. In the excitement of discussing this new and terrible theory of the awful event, people ceased very soon to concern themselves about the authorship of the report. The suggestion of poor Mrs Humby's guilt took such a hold upon the imaginations even of those who had felt the deepest sympathy with her in her unhappiness, as to make one think that the best human nature has a remorselessly cruel side to it. It was to my mind, shocking even to discuss such a possibility as that of her guilt—nay, as that of her passive assent to such a horrible deed.

'It is no use fuming about it, old fellow,' said a good-hearted brother-officer to me; 'you know how poison flies through the blood when it gets in through ever so tiny a puncture. It is the dreadful mystery of the affair which makes one mad!'

Ay, there was the rub now! I remembered the dry voice of Colonel Jack that night assuring me that she was 'quite safe'—and an honest and less ill-natured man than the colonel did not breathe. I understood it now: he had been suspicious from the first.

The extraordinary story of Mrs Humby, to which she still adhered, dumfounded her best

friends. That, after the fire had started, her husband was dressed in his out-of-door clothes, helmet and all—that he attempted to strangle her in her bed, and was frightened from his fell purpose by her shrieking—and that then he went back to his chamber and lay down on the bed to be roasted alive—it was incredible. And yet there was not a symptom of mental weakness about her. Dr Rainsford, one of her warmest friends, saw her several times, and was positive her mind was as clear as his own. She was under no delusion. Yet who could attempt to explain such a story as she told?

I have endeavoured to keep myself in the background whilst relating this narrative. I think, too, that during those exciting days I was the least demonstrative man in Jullabad. The reason was, that I could not trust myself. For months the image of that defenceless and unhappy wife had haunted me. It was inexplicable to myself, but none the less the fact, that the white unconscious face that lay on my shoulder that night in the garden was constantly present to me like a silent reproach. I often think that, if matters had gone on in that bungalow much longer as they were, I should at last have ended Colonel Humby's life with my own hand. I could not have borne the contemplation of that poor girl being slowly and surely 'done to her death.' I had seen her in brighter days, when, in lovely youth and gay innocence, she looked nearly akin to the angels; no one else in Jullabad had so seen and known her.

The horrible imputation of her possible guilt I could not endure with patience; I bore it for a day or so, until I witnessed the fearful fascination which it exercised over people's minds, and then I resolved that one man at least should stand out in Mrs Humby's vindication.

The rumour went round one afternoon that she was making preparations to leave India at once. It was quite credible—for what means had she of defending herself? The moment I heard it I determined to do my utmost to dissuade the poor girl from so fatal a step. I went straight to that loveliest and best of women, who was at the same time the friend and idol of every young fellow in the station—Lady O'Reilly. I saw her at once, explained my business, and asked her advice.

'You are entirely right, Mr Everest; she must not be allowed to go,' was the prompt reply. 'Stop her from doing so, if you can; and should you fail, come to me again. I may be able to help you.'

'I think a lawyer ought to be retained in her interests, Lady O'Reilly?'

'Certainly. There is Mr Mapleson, the barrister, an excellent man. Have you money enough to retain him?'

The question awakened me to a new aspect of the business. But there was no occasion for embarrassment with Lady O'Reilly, so I answered frankly, looking straight into her blue eyes: 'I am unfortunately the poorest man in the station. I have an invalid mother and sister at home to support. But money will not be wanting, I am confident; every fellow in Jullabad will contribute freely, if necessary.'

'Go and see her, Mr Everest,' said the lady after a pause; 'and later on, you can engage the lawyer. I shall expect a call from you again this evening.'

Thus fortified by Lady O'Reilly's approval of what I purposed doing, I directed my steps to the bungalow of Colonel Jack the magistrate. I felt nervous upon approaching Mrs Humby on so delicate a mission, for although her image and her sorrows filled so much of my being, I was yet a comparative stranger to her. I did not even know whether she had any remembrance of seeing me a couple of years before at Mentone—any knowledge that it was I who had borne her in my arms up the garden that night—whether, in fact, I was less a stranger to her than the other young men of Jullabad. What expression would her eyes assume when I presented myself before her with the mission which I had taken upon me?

As I drew near, I was glad to observe Colonel Jack sitting alone in the veranda. He evidently regarded me with some interest as I approached. I was a little embarrassed by his attention, but I walked up as indifferent as I could.

'How d'ye do, colonel?—Mrs Jack is well, I trust?'

'Very well, Mr Everest, thank you.—Take a chair. Will you drink anything?'

'Thanks; no.' I sat down, hardly knowing how to break my business—it was, in fact, specially so little business of mine. But the colonel looked expectant, as though he clearly divined I had not called out of mere courtesy.

'Colonel Jack,' I said, fidgeting, 'it may seem no particular concern of mine, but some one was bound in duty to take it up. I refer to this terrible charge which has been insinuated against Mrs Humby. She has nobody to defend her.'

'If she has any friends,' observed the colonel quietly, 'they are far away just now.'

This might mean two things.

'She has plenty of friends in Jullabad,' I replied, 'who are willing to help her, if they can see a way to do so. We will take up her cause for her.'

'That's very chivalrous—very proper,' said the colonel.

'It is rumoured that she is thinking of returning to England. Is that so?'

Colonel Jack's voice was exactly what it was the night of the fire. 'I don't know what she thinks, poor thing; but she is not going to England—yet.' He turned his face, and I followed his glance with cold horror: at a door in the veranda I saw a native policeman. Mrs Humby was a prisoner!

### SENSITIVE PLANTS.

THE sensitive plants *Mimosa pudica* and *sensitiva* are among the most interesting products of the vegetable kingdom. Nearly every one has seen these graceful and humble children of nature, and touched their tender, shrinking leaves with an experimenting hand; but very few have taken the trouble to examine them as they deserve. The botanist—restrained, perhaps, by pity for their humility—seems to have seldom used his section-knife and forceps on them; and while other wonders of the plant-world have been fully investigated, the *Mimosa* remains almost unknown.

The *Mimosa* is a native of Brazil; but it has

long been an occupant of our British greenhouses. In grace of form and beauty of colour, no other plant surpasses it. Its tender leaflets shrink and droop at the lightest touch, like a meek spirit from the world's gaze. Its graceful feather-shaped leaves, in common with most similarly shaped leaves of the *Leguminosæ* or Pea tribe, to which botanical order the *Mimosa* belongs, close at the approach of darkness; and its extreme sensitiveness is but an extension of this peculiar plant-sleep. Wind or rain causes its leaves to close and its stalks to droop. When suddenly shaken by the wind, the leaflets and leafstalks fall simultaneously. The same effect is seen when a plant is put into a darkened room during the day. A strong light from a paraffin lamp was placed near two plants of *Mimosa sensitiva* at night. After thirty minutes had elapsed, one of the plants, the more vigorous of the two, opened its leaves partially; the other or less robust plant showed almost no feeling. A plant which had been on an exhibition table at a flower-show for two days, and which was noticed to receive constant attention from some children present, was found to have lost much of its excitability, and did not again return to its normal state, though the plant continued in a seemingly healthy condition, for about a month afterwards. Two leaves which were nearest the edge of the table, and consequently oftener touched by the children's fingers, were completely immobile for ten days after the show.

The vapour of chloroform, prussic acid, ether, and nicotine, irritates the leaves, and in some cases destroys their mobility. A little chloroform dropped on the base of a leafstalk causes it to droop; and the leaflets, beginning at the apex, and proceeding to the base of the leaf, close in succession. A plant, the leaves of which were heavily chloroformed several times, withered and died in a few days. The sun's rays concentrated in a lens and thrown on a leaf cause it to contract quickly.

The cause of the peculiar excitability of sensitive plants, and the centre of its action, are still undetermined. Various theories have been adduced to explain them. Dr Dutrochet's theory is most favoured by botanists of the present day. His explanation is, that 'the principal point of mobility exists in the little swellings situated at the bases of the common and partial leafstalks. This swelling, or intumescence, is formed of delicate cellular tissue.' He says that 'the agency producing the mobility is in the ligneous part of the central system of this intumescence, and in certain tubes supplied with nervous corpuscles serving for the transmission of the sap.'

Dr Balfour says: 'In the swellings at the bases of the leafstalks the vascular bundles are disposed in a circle near the periphery, and may be concerned in the leaf-movements. Mechanical and chemical stimuli are supposed to act by inducing alterations in the contents of the vessels and cells.'

These theories are unsatisfactory, and there is still much room for further investigation into the origin of the peculiar phenomena seen in the *Mimosa*. The manner in which it closes its stalks and leaves at the approach of darkness is very interesting. As the gloaming gently falls round the plant, the leaflets move upwards towards each

other till they touch; the secondary leafstalks converge and slowly droop till they are nearly parallel to the main leafstalks, which, in their turn, fall till they point to the ground. Thus gently and silently it folds itself to sleep at the close of day, and rests till the light of morn awakes it to renewed grace and beauty.

Weak with nice sense, the chaste *Mimosa* stands,  
From each rude touch withdraws her timid hands;  
Oft as light clouds o'erpass the summer glade,  
Alarmed, she trembles at the moving shade,  
And feels, alive through all her tender form,  
The whispered murmurs of the gathering storm;  
Shuts her sweet eyelids to approaching night,  
And hails with freshened charms the rising light.

As Humility or Meekness is typified in the world of birds by the nightingale, that

Sings in the shade while all things rest,

so in the plant-world, the meek, shrinking *Mimosa* typifies that brightest and purest attribute of the human mind.

### OLD STORIES.

'THERE is nothing new under the sun,' we are told; and the truth of this assertion is strikingly exemplified in the case of stories and jests, to the extreme antiquity of which the attention of science has lately been drawn. It would seem that our ancestors were fertile in jokes, and that these jokes once made were never forgotten. Mr Clouston has published a book entitled *Popular Tales and Fictions*, in which he investigates the origin and adventures of stories and jests. He believes that most of them originated in Asia and India, and thinks they were carried about the world by Buddhist missionaries, by translations of Indian stories, and by other means. But it is well known that several of the pantomime stories existed in ancient Egypt before we had any information about India at all; and therefore very little light is thrown on the origin of stories and jests by the theory of borrowing from the East. There are certain jokes which are common to all nations; and we may take it that, once invented, they were handed down from generation to generation, and passed from race to race. Most of us have heard, for example, of the gentleman who was writing a letter in a coffee-house, and perceiving that an Irishman stationed behind him was reading every word, he concluded his letter by saying, 'I would write more, but a tall Irishman is reading over my shoulder every word I write;' whereupon the self-convicted Hibernian exclaimed, 'You lie, you scoundrel!' This has frequently been quoted as a characteristic Irish bull; but Mr Clouston brings the same joke from the *Baháristán* of the Persian poet Jami.

Whether we believe that these old stories, or the greater part of them, were invented in one district, or that the human mind is only capable of inventing a certain number of jokes, and invents those jokes alike everywhere, certain it is that there is a wondrous lack of originality in the mind of man. There is a venerable story told to

the effect that a visitor in the office of *Punch* remarked to the editor: 'I suppose you have lots of good things sent in to you from outside?'—'O yes,' was the reply; 'lots.'—'Then why don't you put them in?' was the cruel retort. Artemus Ward, too, had a fling at our old friend. 'I think,' he said, 'that an occasional joke improves a comic paper.' We have no doubt Mr Burnand could speak very feelingly on this point. The editor of a comic paper must be painfully aware of the extreme age of jests, and of the very few subjects on which the changes are rung. No doubt *his* life is not a happy one.

It may be roundly asserted that it is almost impossible to invent such a thing as an original jest. The person who first hears it or makes it may think it is original; but the chances are that it is a veritable Joe Miller, and that it has done service hundreds of times before it occurred to that particular person. Take, for example, a story told by Mr Payn. He says that when at Eton, a fifth-form young gentleman inquired of him in a drawing voice, 'Lower boy, what *might* your name be?'—'Well,' replied Mr Payn, 'it might be Beelzebub, but it isn't'—an excellent repartee, for which, however, he received a good hiding. Very likely, the genial and highly gifted novelist had heard the story told of somebody, and forgot all about it. But, by a phenomenon of the working of the mind into which we need not enter, the main idea might have been stowed away in his memory; and thus he was, in a sense, guilty of unconscious plagiarism. Supposing, however, that such a thing as an original joke could be invented, it would not be easily allowed to die. It might find its way into *Punch*, and then wander into some of the American, French, Italian, or German comic papers. Then it might probably recommend itself to an English journalist who had not seen it in its original form, and in the course of time again find its way into one or other of the foreign papers. In each case it would be 'adapted' to suit the circumstances; new names would be given to the heroes, and new places discovered for their habitation. This sort of thing would go on until the story could be easily recognised; and then our American cousins would call it a 'chestnut'—that is, an aged and decrepit joke.

In the process of 'adapting' stories, a large amount of lying is involved, because your average Anecdote Fiend nearly always says that he saw and heard what he relates. In this connection the conductor of the 'Editor's Drawer' in *Harper's Magazine* had a curious experience, some four or five years ago, of the unvarnishedness of most men. There is a story told to the effect that, in the car on a train from Toledo to Chicago was a man who sat alone, looking absently out of the window, and appearing dejected. During the journey, an accident happened to a newsboy, and the generous passengers passed round the hat for him. The solitary man alone refused to contribute anything. Somebody remarked audibly upon his stinginess, when he turned round and said: 'Gentlemen, it may appear strange to you that I give nothing; but I haven't a cent of money. The fact is, I was married yesterday, and I am on my wedding trip,

and I hadn't money enough to bring my wife along!' This story was told to the editor by a clergyman, who heard it from a friend of his who *saw* it, and who had just returned from the West. In the December following, the Editor of the *Drawer* was told a story to precisely the same effect by a gentleman who *heard* and *saw* it when going down the Danube from Pesth. The editor, in the following summer, received from a gentleman in Paris a letter, in which the writer said that a curious incident happened to him when on a Rhine steamer. Need we say that the incident which the writer mentioned was almost exactly the same as that which had happened in the experience of the two other persons in the same year—once near Chicago, once on the Danube, and now on the Rhine! The editor naturally doubted whether the experience narrated had happened to any one of these unvarnished persons; and subsequently, on hearing the 'original' of the story, concluded that they had only given to it 'a local habitation and a name.' In Mark Lemon's time it was the custom to keep an elaborate index of the jokes in *Punch*; but even this precaution did not wholly protect it from unscrupulous 'adapters.' Several jokes were printed in the belief that they had been heard by those who sent them in, and it was not discovered until too late that they were copied word for word from some of the earlier volumes.

There are certain subjects which are by common consent deemed suitable for witticisms, and many of these are rarely mentioned without a smile. Some of these witticisms are veritable Joe Millers—not to go back any farther—and yet we go on using them as freely as ever, and probably will continue to do so for many years. Mothers-in-law, now: is it possible to invent a new joke in connection with those much-abused ladies? Landladies, too, have suffered a heap of indignities from the professional wit. The food they supply to boarders and the smallness of their scuttles of coal are considered fit and proper subjects for numberless jests. Then there is the editor's waste-paper basket; how many, many times it has been thrown at the head of luckless authors! And the paper on which contributors write has been the means of introducing scores of hints about the butlerman and the manufacturer. Any joke in connection with a legacy from an old aunt or uncle, or any reference to the pets of the aforesaid relatives, ought almost to be suppressed by Act of Parliament. Sausages, 'pork' pies, umbrellas, false teeth or hair, newly married couples, old maids—what adequate punishment would 'fit the crime' of joking on these and many other equally hackneyed subjects, only Mr Gilbert could say.

Every man has a pet joke, just as every man has a pet word or phrase. The Professor, in the *Autocrat of the Breakfast Table*, on discovering that he had repeated the same witticism to the same person in the same circumstances, satisfied himself by observing that only a perfectly balanced mind could so exactly reproduce itself. The antiquity of jokes and stories is a striking proof of the conservatism of the mind; and to banish those stories which are familiar would deprive us of all themes for jest. After all the cynicism lavished on hackneyed jokes, however, most of us must agree with Washington Irving, that

'honest good-humour is the oil and wine of merry-meeting, and there is no jovial companionship equal to that where the jokes are rather small and the laughter abundant.'

#### LOCOMOTIVES FOR HIGH SPEED.

As if the present high rate of speed of our express trains was not swift enough, engineers are endeavouring to increase it in some cases from sixty to eighty miles an hour. We learn that Engineer John Hogan, on the Philadelphia and Reading Railroad engine No. 134, has driven it at the astonishing speed of a mile in thirty-eight seconds. Other engineers, with Reading engines Nos. 206, 411, 96, 97, 98, and 99, have made miles in forty-three and forty-four seconds. Hogan's speed is at the rate of over ninety-four miles an hour; those of the others are respectively eighty-three and a half and almost eighty-two miles an hour. These high rates of speed were made under circumstances all of which were favourable to a successful test.—A novelty in the line of engine-building is just now attracting the attention of engineers and builders. It is a locomotive designed by M. Estrade, a graduate of l'Ecole Polytechnique, which is to be experimented with on the southern lines of France. The new locomotive depends on its large-sized driving-wheels for the speed of seventy-eight miles an hour which it is expected to attain. The engine, tender, and carriages are fitted with wheels eight and a half feet in diameter. The engine is of the outside cylinder type, with slide-valve on top of cylinder and all the gearing carried outside. The average speed which the locomotive is expected to make is between seventy-two and seventy-eight miles an hour with a train of loaded carriages. If the French engine averages the speed expected, it will be able to make runs exceeding anything on record.

#### FORGET-ME-NOT.

A BLUE forget-me-not  
In some nymph-haunted spot  
Bends o'er a stream;  
What sees it mirrored there?  
Itself—as sweet and fair  
As flowers may sometimes seem that light a  
heaven-sent dream.

What is it that doth make  
The swan, that on a lake  
Floats through the night,  
To gaze so fixedly?  
Ah! surely it doth see  
Its beauty made more bright than in the day's  
broad light.

And I, too, once did look  
Within a rippling brook,  
But saw not there  
Aught save the sunlit eyes  
(Vision of Paradise)  
Of her who is most fair of maidens, and most  
rare.

## IN A WILD GARDEN AT SHIRAZ.

SHIRAZ is thoroughly Persian. No European innovations are to be found in the city where sleep the two great poets of Persia, Hafiz and Saadi. In summer, Shiraz is hot, and those who can do it, pass the very hot weather in a garden. It was the writer's good fortune to be on friendly terms with a Persian grandee who was the happy possessor of one of the largest, shadiest, and most retired of the gardens of Shiraz. No Persian will refuse the hospitality of his garden to any decent person; practically, any man's garden is open to all the world, save when the owner, his wives, or his friends are enjoying their *dolce far niente* there. Fortunately, the proprietor of the Resht-i-Behešt (Envy of Heaven) also had a magnificent garden attached to his town mansion for his own use; this enabled the writer to pass the dog-days in that earthly paradise.

About a mile from the walls of Shiraz, just across the empty river-bed—for in most summers the Shiraz river runs dry, the waters being drawn off for irrigation—lies the garden of the Resht-i-Behešt. The three large rooms have been carpeted. Fly-blinds have been hung over the doors and window-holes, for the building is a mere summer-house. The tiles have been swept and sprinkled. The servants have pitched a little tent for themselves. The cook has constructed a series of furnaces in the open air. The little brick-bound stream running in front of the three rooms gurgles merrily. The great brick *sarkā*, or raised platform, has a carpet spread on it; and a lounge-chair, or a mattress with big Persian pillows, is placed there to invite repose. All is shade here. The trees are so planted that one *sarkā* is overshadowed till afternoon; the other, two hundred yards off, till sunset. By the side of each broad path is running-water. But there are no 'rows of stately lilies,' no 'winding walks where roses grow'; an occasional hedge of moss-roses, thousands of tufts of the double and single narcissus—these are all the flowers, save the wild ones. The rest is a sort of jangle of fruit and forest trees,

with a dense growth of underwood and grass. By the sides of the many streams the foliage is thick and lush. The place swarms, literally swarms with nightingales. A nightingale is a very poetical bird; but even nightingales pall when in thousands and when their song disturbs one's slumbers. They are very busy about midnight; but just an hour before dawn the music is deafening and sleep impossible. Nature's alarum is, however, a blessing, for what more enjoyable than the early stroll in the cool garden by the bubbling waters. No one is here save ourselves, our servants, and the gardener and his boy. No one will call save on urgent business, for it is understood that a man goes to a garden for privacy, to take his holiday, to recuperate. The dogs having fraternised with the gardener's watchdog are turned loose for a run, and hunt the small birds in the brushwood. A hubble-bubble and a cup of coffee—the former smoked sitting on a stump beside the running-waters in the cool shade—are very grateful in the early morning. Still more so is the bath in the icy-cold tank which has been duly cleared out for our use. Then perhaps a book for an hour. Soon the sun rises; soon we feel its heat, and retire to umbrageous nooks to avoid it. But the Persian sun is not to be denied; we are driven into the building, as the heat becomes stronger and the flies get active. The hum of insects becomes loud. But indoors all is cool, all is quiet. We have come to be lazy; we are so. No blush suffuses our cheeks when we find that we have slept and that it is nearly noon. We have come to avoid the sun; we succeed in doing so, for we breakfast, still in the shade, in the portico. Again a lounge under the trees and by the brooklets. Somehow or other, we get through the afternoon. Have we slept? Possibly. At five, however, the Russian *samovar* is brought with many fruits, and we partake of tea in tiny cups, and the everlasting but grateful hubble-bubble.

Now is the time for very intimate friends to call. We sternly deny ourselves to importunate on business. Are we not *en retraite*? Are we not

in the garden? The sun will be down in half an hour. It is cool; the pleasant wind which is always felt towards evening in Shiraz has commenced to blow. The horses are brought. We enjoy a two hours' ride; a smart canter through the gardens of Meshed Verdi, or across the sandy plain of Jaffirabad. Or we, too, make our calls on other sojourners in gardens. But we avoid the town, the hot dusty town. If we must go, we do, much against the grain, hurriedly returning to our wild garden. Oftener than not we visit other gardens, empty as a rule; several about on our own Resht-i-Behesht. Perhaps we find them tenanted; we attempt to discreetly retire; by no means is this allowed. 'Bismillah! you must take one cup of tea and eat a pomegranate;' or whatever the garden is famed for, for each of the gardens has its speciality. There is no intrusion in the matter. The people are summering, and honestly glad to see us. They will surely return this chance visit, and we shall regale them in the same way, and be as unaffectedly glad to see and chat with them.

Our particular garden is celebrated for a white apple which has an unmistakable flavour of rose-water. But it is also the shadiest garden near Shiraz, and the coolest. We are quite sure. Have we not lived in them all, and do not we come to this particular garden every year? That is proof enough, at all events for us.

It is getting dark; but the moon is rising, the glorious Persian moon. As we return to our garden we see lights in nearly every neighbouring one. On the *sarkū* in front of our living-rooms is set the table with all its civilised appliances; the wine is in snow, for, in Shiraz, snow is the luxury of even the poorest, ice being rare and dear; but there is always plenty of the pure snow to be got from the crevices of the neighbouring mountains. Dinner is served, the regulation English dinner, perhaps with a native dish or two—the smoking *pillau* with its fowl boiled to rags, or a *fizzinjahn* of partridge, or of lamb (we get lamb twice a year in lucky Shiraz).

Dinner is over; we sit on our *sarkū*, the moon peeping through the trees and lighting the place up. The dogs are chained up as sentinels around the building. The gardener's pet bear descends the tree to which he is chained, as soon as the dogs are secured; he discreetly retires to the branches when his enemies are loose. We provide Bruin with a meal of boiled rice. From the servants' quarters resound the melancholy love-ditties of Iran, our literary cook improvising scandalous local songs, which are received with much mirth. Gradually, as the servants lapse into silence, we retire to the roof where our bedding is prepared. 'Tweet, tweet, tweet, bubble, bubble, bubble'—a nightingale. The noise is repeated with variations; but we are not romantic. We are tired; we have dined; we turn over, and our roof being free from mosquitoes, we drop off.

'Hoi, hoi—thieves, thieves!' Bang goes a gun from the servants' quarters; there is much running about, much barking of dogs. In the morning, nothing is missing. There is no sign of the robber; he probably was but a visionary one. As before, an hour before dawn the concert of birds becomes deafening. We pop on an Afghan *poosseen*, a long sleeved robe of sheepskin, fur

inside, for it is slightly chilly. Again we potter aimlessly about the wild garden. Another day, which will be passed much as its predecessor, has commenced.

## RICHARD CABLE,

THE LIGHTSHIPMAN.

### CHAPTER XLVII.—DISMISSAL.

AFTER Mr Vickary had seen Josephine leave Captain Sellwood's room with his boot, he waited about, keeping himself concealed, till she returned with the boot and shut the door, whereupon he went to Miss Otterbourne in the drawing-room, whither she had retired after dinner, and was waiting for her nephew to rejoin her, when he had sat sufficiently long over the wine and dessert.

'I beg your pardon, ma'am,' said the butler; 'I do hope I'm not taking a liberty, ma'am; but may I ask if you told Cable to go in and out as she liked of the captain's apartments?'

'Of course not, Vickary.'

'I'm sorry to trouble you, ma'am. I see her running in there a score of times—it's remarked by the servants, and rather unpleasant, and Mrs Grundy says she has given no such orders; so we thought it best, ma'am, if I were to ask if you, ma'am, had empowered her so to do. You will excuse me, ma'am, but when there is talk—and when the young woman tells lies about it!—'

'Lies, Vickary!'

'Well, ma'am, just now I see her go in there, and the captain there too. I said to her that I didn't consider it quite right—it was not her place; and she told me that the housekeeper had set her to attend to the room, which, ma'am, I knew not to be true.'

'The captain is in the dining-room.'

'I'm sorry to differ from you, ma'am; but he went up very quickly to his rooms, and Cable was in after him directly. It must be very unpleasant, ma'am, for a young gentleman to be so run after, and it makes talk in the house.'

Miss Otterbourne was much astonished and greatly indignant. 'Do you mean to tell me, Vickary, that she is there now?'

'I believe so, madam.'

'And the captain is there?'

'I saw him by the fire; and Cable shut the door after her when she went in.'

'Go and fetch her at once.—No. I will go myself. I really—upon my word—to say the least—how inconsiderate.'

The old lady was very angry. She raised herself with difficulty from her armchair, drew a silk handkerchief over her shoulders, as a protection against damp or draught outside the room, and walked in the direction of her nephew's suite of apartments. When she opened the door and saw Josephine seated in an armchair on one side of the fire and the captain standing near her, in earnest conversation, she was as irritated as if her nettlerash had suddenly come out over her temper.

As soon as Josephine had left the room, Miss Otterbourne said—she was panting from having ascended a flight and walked fast—'I—I am surprised. These may be Indian barrack habits, but—'

Captain Sellwood managed to get his boot on; his face was nearly the colour of his stocking.

'And only partly dressed too,' gasped Miss Otterbourne, 'half shod, and—and, with a hole in your stocking sole. Good heavens, how indelicate!'

'There was a peg in the boot,' explained Captain Sellwood.

'My dear Algernon, there generally are pegs in boots.'

'I mean—it hurt me, and I asked Josephine.'

'Josephine!'

'My dear aunt, we have known each other since children.'

'Oh!' The nettlerash was alleviated. But presently it came out again. 'That does not explain her coming to visit you in your private room, sitting in your armchair.'

'Where would you have had her sit, aunt?'

'Algernon—she is a servant.'

'Aunt—she is a lady.'

'A real lady would never have run after you into your private apartments.'

'She did not run after me. She did not know I was there. She was picking up the swansdown I had inconsiderately strewed on the carpet, when I came in.'

'Then she should considerably have gone out.'

'I asked her for a hammer.'

'She had no right here.—And are you aware, Algernon, that you have had a hole the size of a threepenny piece in the sole of your foot, at the—heel, exposed? If you had had any sense of decency, you would have kept your foot flat on the carpet, instead of turning it up.—I don't care whether she is a lady by birth and breeding; she is no lady at heart, or she would never have sat here half an hour or three-quarters, staring at a bit of your heel exposed, the size of a threepenny piece. That alone stamps her. She has a nasty mind, and must go.'

'My dear aunt—surely you are hard in judging. There was a peg in my boot that stood up, and that hurt my foot, and no doubt at the same time worked the hole in my stocking.'

'That is very probable,' said Miss Otterbourne. 'But I should like to know, were you aware it was there?'

'No; I felt my heel painful; I do not think I noticed that my stocking was rent.'

'That excuses you, but not her.'

'Perhaps she did not see it.'

'Nonsense; of course she saw it.'

'Aunt, do sit down.'

'In that armchair, vacated by her!—No! She has been looking at the hole in your stocking from that armchair.—I couldn't do it.'

'Do what, aunt?'

'Sit in the chair after that—the old lady was now very angry, and very convinced that Josephine was no lady—gloating on it—positively gloating on it.'

'If any blame attaches to any one, it is to me,' said Captain Sellwood. 'I came in here out of my bedroom, with my boot in my hand, for the poker, with which—'

'Why did you not ring for John Thomas?'

'It was not worth while. When I came in, I found her on her knees picking up the bits of down, and I asked her for a hammer, or

she offered one, I do not recollect which; and then she whipped the boot out of my hand and went off with it. It was most good-natured of her.'

'I object to young women being good-natured with young men. Good-nature may go too far.'

'And then I asked her to sit down. I wanted to talk to her about Hanford, and my mother, and mutual acquaintances. I was awfully sorry for her, to see her in such circumstances.'

'I disapprove of young men being, as you call it, "awfully sorry" for distressed damsels; there is no knowing to what this awful sorrow may lead.'

'My dear aunt, it was natural. I have known her, and she was my playmate since we were children. I do like her; I always have liked her. Why, if I were in reduced circumstances, you, aunt, would not cut me.'

'No—slightly mollified. 'But I am your aunt, and not a young creature. That makes mountains of difference.—And pray, is it only her reduced circumstances that stirs up in you such awful sorrow? She has had some other trouble, I know. Are you acquainted with her intended? Have you brought her a message from him?'

'She has no intended.'

'Then it is broken off! I was sure she has had an affair of the heart, she has looked so peaky and pale since she has been here.'

'I do not know anything about her heart affairs,' said Captain Sellwood. 'I know that one or two fellows have been awfully fond of her.'

'Indeed! Is it possible that one who has confessed to awful sorrow should also allow awful fondness? That it leads to awful chumming, I have seen with my eyes.'

Captain Sellwood did not answer. He had spoken inconsiderately, and his aunt had taken advantage of his mistake.

'Good gracious, Algernon! You don't mean to tell me that there has been an attachment in this quarter?'

'No attachment,' he said, looking down and knitting his brows. 'For an attachment, the chain must hold at both ends.'

'Merciful powers, Algernon! Can your mother have sent this chum of yours here to be out of your way!—You were so infatuated, there was no knowing what lengths you would go, and my dear sister hoped that by putting a distance between you—'

'No, aunt—nothing of the sort.'

'But I must get to the bottom of this. There is something kept from me. Is it true that you have—that you have—harboured an unfortunate passion for this young person—this chum, as you call her?'

'I did love the young lady. We have known each other since we were children—at least since she was a little girl and I a big boy. She was so lively, so daring, so witty, I could not help loving her. But that is over now.'

'I should hope so—I should hope so indeed. A servant-maid—a servant-maid in my house! Lord have mercy on us! It is a wonder to me you did not turn Mohammedan in India, and put your neck under Juggernaut's car.'

'My dear aunt, what have Juggernaut and his car, and Mohammedanism and Josephine, to do with each other?'

'What a world we live in!' groaned Miss Otterbourne. 'Radicalism everywhere!'

'You forget, aunt, that she belonged to the class of life to which I belong. I may tell you this—that she has inherited a very handsome estate, but has conscientious scruples, which I do not understand, because I do not know the circumstances, against her enjoying it; and rather than violate her conscience, she has come into service to you. I honour and respect her for it, aunt!'

'But—she is a servant. She is my lady's-maid. It does not matter one hair whether she be heiress to untold millions or be a household drudge, the moral indelicacy is the same. She ought never to have sat here in your chair, talking to you when you had a hole in your stocking.—No, Algernon, you may say what you will—you may try to throw dust in my old eyes, but I shall never get over that hole in your stocking.' She had said enough and heard enough, and she left the room.—'Smoke your cigar,' she said as she left, 'and then come down to me. I presume you can light it without the assistance of your *chum*.'

When the old lady reached her drawing-room, she was so hot that she sank into her chair and fanned herself for several minutes without getting any cooler. She rang the bell, and bade John Thomas send her Cable at once; and in two minutes Josephine came to her.

'Cable,' said Miss Otterbourne, fanning herself vigorously, 'I am surprised and offended. I *did* suppose you knew your place better, and had more delicacy than to sit in a room with a gentleman who had a hole in his stocking.'

'Had he? I did not know it, ma'am.'

'Did not know it? Of course you knew it! I saw by the direction of your eyes, the instant I came in, that you were examining it.'

'I did not give it a thought, even if I saw it, and I do not believe I did that. But, surely, ma'am, there is no harm in that.'
